Droplet Of Hope

Semi-finalist (2021)

Collecting samples drop by drop to
gain targeted carrier for cancer
treatment.

The goal of my studies is to prepare
better versions of available
medications for improvement in
cancer treatment. As part of my study,
I purify my prepared nanoparticles
from other materials and collect them
drop by drop which is very
challenging; however, I always try to
be hopeful and think to myself what if
someday these drops could save
someone's life.

Because fighting cancer either in body
or laboratory needs HOPE more than
anything.
