

# Lessons Learned from Twitter Use in Medical Education

Thane Chambers and Janice Kung  
University of Alberta, John W. Scott Health Sciences Library

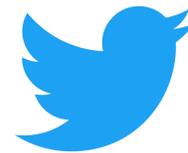

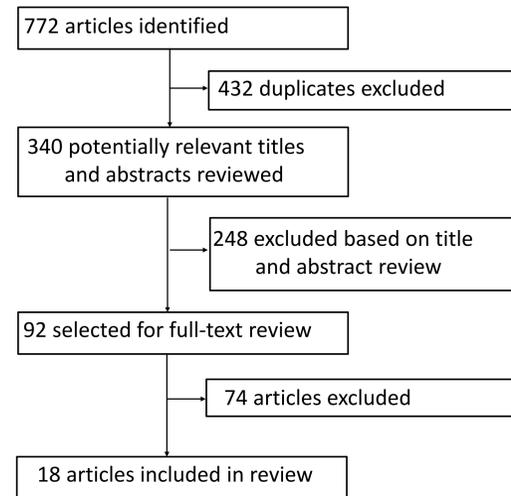

## WHY IS THIS IMPORTANT?

Twitter appears to have a lot of potential for medical education. It can:

- Facilitate active participation
- Build community among disparate members
- Work well for asynchronous learning
- Provide students and instructors with real-time feedback and communication

But what is its current state of use among educators and instructional librarians? How can its potential be harnessed by librarians? Is it an effective tool for learning and building knowledge?

## PRISMA FLOW DIAGRAM

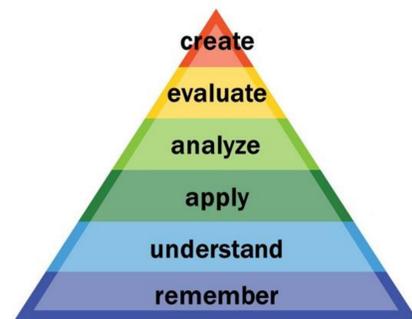

How is Twitter used in Medical Education?

## METHOD

A comprehensive literature search was conducted on Sept 5, 2016 to identify Twitter's use in medical education. A data extraction form identified the categories listed below. The level of instruction was categorized by Bloom's Taxonomy, a model that demonstrates different levels of thinking in educational, training, and learning processes<sup>1</sup>. Each level requires a higher level of abstraction and analytical thinking than the one below. The review only focused on articles that integrated Twitter into curriculum-based teaching.

Bloom's Taxonomy<sup>2</sup>

Dermatology	1
General Medicine	3

## DISCUSSION

- Based on the 18 articles that underwent full-text review, Twitter is often used passively as a way to disseminate information to students and is not used to develop learning communities.
- It is not clear if Twitter, as a medium, can facilitate community communication. Perhaps the issue is that the activities are not well designed for community building and communication.
- Twitter is used primarily as a supplementary learning activity and is usually not used in classroom activities. It is also not used as a required instructional activity.
- This "secondary-ness" may mean that students are less engaged.
- Learning outcomes were rarely measured in studies.
- Primary outcome was usage, but usage is not tied to learning or understanding according to Bloom's Taxonomy.
- Due to the passive nature of how Twitter is used, the studies were relatively low on the levels indicated on Bloom's Taxonomy.

## RECOMMENDATIONS

Twitter is most effective as a medium to provide feedback to students because it's quick and easy to use (does not get buried in emails). Twitter can also be used as a way for students to provide feedback to instructors. An example of this may be having students use the hashtag, #iamconfused, to inform faculty if they are still struggling with a concept. This could be a quick way for instructors to identify problem areas.

Careful planning is necessary because it may not be an effective use of time for administrators and instructors. Educators should be encouraged to use some form of assessment to determine if Twitter is an effective tool. Simple questions such as *Is the Twitter activity linked to the learning outcomes of this class or is it a distraction*, may help. Considering the low usage of Twitter activity by those aged 18-29 (estimated to be around 36%)<sup>3</sup>, it may not be the best use of educational time if instructors need to explain how to use Twitter.

This medium can be overwhelming to those who are unfamiliar with it. Due to the lack of higher level thinking and limited conversation, Twitter may not be the best tool for community building or support. Based on the studies reviewed, we do not see practical applications of Twitter in library instruction.

Maybe in time, there will be more interventions based on educational theory and sound pedagogical practices. Until then, based on the literature found, we do not recommend Twitter for library instruction.
