THE UNIVERSITY OF ALBERTA

A DESCRIPTION OF SIMILES FROM CHILDREN'S FICTION

bу

MARGARET M. LOCKHART

A THESIS

SUBMITTED TO THE FACULTY OF GRADUATE STUDIES AND RESEARCH
IN PARTIAL FULFILMENT OF THE REQUIREMENTS FOR THE DEGREE
OF MASTER OF EDUCATION

DEPARTMENT OF ELEMENTARY EDUCATION

EDMONTON, ALBERTA

FALL, 1972

In the qualitative description it was also found that the patterns of the elements of some similes were far more complex than the patterns of others. That a child could expect one quarter of the similes he reads to follow a complex pattern, was concluded.

Another finding was that similes were often situated in sentences that were grammatically complex.

From the functional description of similes, it was found that similes filled a variety of roles in a book—some more significant to the development of the book than others.

Several implications became apparent for the educator, the author and the school librarian. One was that children should be taught to use context clues because they could receive great assistance from the context both in identifying the commonalities of similes and in deriving meaning for uncommon words.

Several suggestions for further research were presented. For example, it was proposed that a comparison be made between characteristics of similes that children use and characteristics of similes by authors in order to probe communication gaps between author and reader.

ABSTRACT

Although students frequently experience difficulty in understanding the similes which they encounter in their reading material, little is known about these similes.

The purpose of this study included identification of fiction considered suitable for children in grades four, five and six and commonly recommended for Canadian school libraries; and description of a sample of similes from these books.

From nine book lists recommended by professors in the School of Library Science as used for book selection in Canadian elementary school libraries, a list of fiction was compiled.

From this list twenty books were selected in a random sample, stratified on the basis of particular popularity on American and/or Canadian book lists.

Identified in these twenty books were 769 similes which were then described quantitatively. Of these similes fifty were solected randomly for qualitative description. Finally all the similes in a single book selected for this purpose were described according to the function they seemed to have in the book.

While the number of similes within a single book varied from 1 to 174, it was found in the over-all calculations that the density of similes in the more recently published books was greater than in the older books.

ACKNOWLEDGEMENTS

The writer wishes to express her sincere appreciation to Dr. Jean Robertson, committee chairman, for her continued advice and guidance throughout the various phases of this study.

Appreciation is expressed also to Dr. R. G. Martin and Dr. W. T. Fagan, committee members, for their interest and suggestions.

The help and encouragement of friends and colleagues is gratefully acknowledged. Particular thanks is extended to Jean Trafford who assisted in many practical ways.

CHAPTER I

INTRODUCTION

STATEMENT OF THE PROBLEM

That reading is more than a mere "mechanical skill" is stressed by the Alberta Department of Education A Reading Handbook (1968, p. 6). For the competent reader reading consists of four distinct but interrelated processes:

- 1. Word perception (word identification and recognition with appropriate pronunciation and meaning),
- 2. Comprehension (getting the ideas intended by the author whether stated or implied),
 - 3. Reaction (critical appraisal or emotional response),
 - 4. Integration of ideas.

Because these four processes are essential to reading proficiency, their development is the responsibility of every reading teacher. Are children being adequately equipped in the reading class to function beyond the word perception level? An individual with only the mechanics of reading is as liable to become misinformed as to become enlightened. One type of language which by its nature demands of the reader skill beyond that of initial word identification and recognition is the figurative. This study is specifically concerned with simile—a common figure of speech apparently simpler than metaphor though having a similar function (Nowottny, 1962, p. 54; Alston, 1964, p. 98; Philbrick, 1942, p. 35).

Encounter Between the Child Reader and the Simile

During his reading of similes the child seems expected to:

- 1. Perceive the visual symbols,
- 2. Comprehend that the author is comparing two distinctly dissimilar concepts and is explicitly stating that they are alike, by the use of the word "like" or "as,"
- 3. React to this comparison deciding what likenesses between the two are valid and relevant to the author's meaning in the context and consistent with the reader's own background of knowledge and experience,
- 4. Adjust his conceptual framework in order to integrate the new ideas discovered through the comparison.

For example, in the simile, "a voice like an unoiled gate," (Engle, 1962, p. 16) the reader must:

- 1. Identify and recognize the words,
- 2. Understand that although "a voice" and "an unoiled gate" are very different the author is stating that they are comparable,
- 3. Decide from his own background what likenesses may exist between "a voice" and "an unoiled gate" and which of these similarities are valid and relevant to the context,
- 4. Include in his thinking the ideas resulting from the association between "a voice" and "an unoiled gate."

We are led to ask questions about the ability of the child reader even though assuming his competence at word identification and recognition.

- 1. Does he recognize a comparison of two dissimilar concepts in a simile situation?
- 2. Does he have adequate knowledge of and experience with the two concepts being compared?
- 3. Is he able to associate satisfactorily the two concepts in order to arrive at valid and relevant commonalities?
- 4. Can he then arrive at new information about a familiar concept having seen it through a new perspective—that of its commonalities with a dissimilar concept?

Prevalence of the simile. How frequently do children encounter similes in their reading materials? Hollingsed, (1958, p. 38) in analyzing four series of readers for intermediate grades, found between 107 and 310 figures of speech in each reader. In frequency simile was only surpassed by metaphor and made up over one quarter of the total number of figures of speech found. Groesbeck's study in 1961 corroborated this evidence of the proliferation of similes and metaphors in material written for children. She found over twelve hundred and eighteen hundred figures of speech at grade four and grade five levels respectively within two basal reading and one social studies series.

<u>Difficulties for the child</u>. Research also indicates that many children have a great deal of trouble in correctly interpreting figures of speech. Hollingsed (1958, p. 68) found that the three most common figures of speech—metaphor, simile, and personification—were accurately interpreted only 53 to 59 percent of the time by grades four,

five and six pupils.

The abstract thinking required to interpret similes is not simple. It requires a mental juggling with more than one idea. The young child cannot manipulate as many ideas simultaneously as can the adult (Smith, 1967, p. 19). Werner and Kaplan (1952, p. 104) assert that a "metaphorical language test demands a high type of symbolic behaviour."

The Educator's Dilemma

Realizing that children often have trouble reading similes and that they are frequently presented with them, we are faced with at least two alternatives in solving this problem:

- 1. We could attempt to eliminate similes in material written for the child reader, or
- 2. We could attempt to equip the child with reading skills that would enable him to understand similes.

Either solution seems formidable. In considering the first alternative we realize that it would necessitate eliminating a vast wealth of literature that youngsters have enjoyed down through the decades. Also in purposely avoiding the child's exposure to similes we might be depriving him of a potentially useful and rewarding aspect of reading.

Perrine (1963, p. 52) suggests that "figurative language often provides a more effective way of saying what we mean than does direct statement," because it is a way of:

1. Giving "imaginative pleasure,"

- 2. "Bringing additional imagery,"
- "Adding emotional intensity,"
- 4. "Concentrating" much meaning.

Perrine (1963, p. 53) adds that the risk of misinterpretation involved with every use of figurative language "is well worth taking.

For the person who can translate the figure the dividends are immense."

In accepting the second alternative, that of retaining the simile and preparing the child to read it, we once again face grave implications. What skills and abilities must we teach the child, and how must we teach them in order to ensure his facility to interpret the simile?

The Problem

In answering these questions it seems basic to investigate the similes themselves.

If children read at all, they will read the material that is available to them. One major source of books at the child's disposal is the school library, a large proportion of which is often fiction. From information researchers have provided, one could expect to find a considerable amount of figurative language in this fiction. Being a common type of figure of speech, similes may occur frequently. Therefore, it would seem vital to become more knowledgeable about the similes contained in these books before deciding how to prepare the child to read them.

Research has generated a limited amount of information regarding similes and the child reader. That similes are present in material written for children and that children have difficulty in interpreting these similes has been established in this research. Researchers have also attempted to discover relationships between certain factors in children and the success or failure these children experience in interpreting figurative language. Interpretive responses of children have been analyzed and reasons formulated attempting to explain certain difficulties.

While researchers have worked with children and their responses to figurative language, there seems to be a paucity of research (other than frequency counts) concerned with the figures of speech themselves which children encounter. In reading, communication is effected only as the intended meanings of the writer are grasped by the reader. These meanings frequently are expressed figuratively, often in similes. Of these similes little seems to be known about their characteristics or their functions in the communication process particularly in the area of children's fiction.

PURPOSE OF THE STUDY

The purpose of this study was two-fold. Initially, fiction considered suitable for children in grades four, five and six and commonly recommended for Canadian school libraries was to be indentified. Secondly, a sample of similes from these books was to be described. This description attempted to expose some quantitative, qualitative and functional characteristics of similes. The following questions were posed to accomplish this two-fold purpose and to clarify the scope of the description.

RESEARCH QUESTIONS

Identification of the Books

Question One. Which titles are commonly recommended on lists used for book selection in Canadian elementary school libraries and are considered to be fiction suitable for children in grades four, five and six?

Description of the Similes

The remaining nine research questions were applied to similes selected from the fiction identified by answering question one. These questions concerned some characteristics of similes quantitative, qualitative and functional.

The following three questions quantitatively involved all similes in a stratified random sample of twenty books.

Question Two. How many similes occur in a book?

Question Three. Do similes occur as often in recent books as compared to older books according to their density:

- 1. Per page?
- 2. Per thousand words?

Question Four. Are similes evenly distributed throughout a book? Consideration was taken of whether or not:

- 1. An equal number of similes occurred in each fifth of a book,
 - 2. More than one simile appeared on a page,

3. Similes occurred in clusters.

In an attempt to describe some qualitative characteristics of similes, the next five questions were applied to fifty similes randomly selected from the twenty books mentioned above.

Question Five. In what patterns do the elements of similes occur?

Question Six. How often is a commonality of subject and vehicle stated by the author or implied in the context?

Question Seven. What are the subjects and vehicles of similes?

Question Eight. How often does vocabulary uncommon in children's reading material occur in similes, and are clues to the meanings of uncommon words provided in the context?

Question Nine. How often is the subject of a simile represented by a pronoun and how many words separate the pronoun from its antecedent?

The final question involved an informal analysis of all the similes in a single book selected by the researcher in an attempt to identify the function of each simile.

Question Ten. What functions do similes seem to perform in a book and what proportion of the total similes in this book perform each function?

DEFINITION OF TERMS

In this study the following terms and phrases will be used as defined below. The first three occur together in a sentence frequently.

Fiction

A book title on a book list was considered to be fiction on that list if the compiler of the book list classified it as fiction. In cases where the compiler of the list had not stated his decision the researcher established whether or not a book was fiction by a process described in detail in Chapter III.

Though they did not state so, it seemed that what compilers of book lists meant by fiction was feigned or invented narrative.

Suitable for Children in the Intermediate Grades

A book title on a book list was considered to be suitable for children in grades four, five and six if the compiler of the list classified the title as suitable for children in these grades or of the ages nine, ten and eleven. Where the compiler of the list had not classified books this way, the researcher made the decision as to whether or not a book was suitable as described in Chapter III.

Commonly Recommended

Those titles occurring on at least three of the nine book lists or on both Canadian book lists as described in Chapter II were considered to be commonly recommended.

Figurative Language

Figurative language is language which deviates from the literal or standard construction (syntactical arrangement), order (established usage), and significance (purport) to achieve special meaning or effect. The various kinds of departure from this standard or literal form are called <u>figures of speech</u> (Norton and Ruston, 1957, p. 36) and simile is one kind of figure of speech.

Simile

This term refers to an expression in which two distinctly dissimilar concepts, both identifiable by a noun or a pronoun, are explicitly stated to be alike by the use of the words "like" or "as." Only those expressions meeting the above qualifications according to the unanimous decision of three judges working independently of each other were considered in this study. For example, "The furnace purred like a great, sleepy animal" (Engle, 1962, p. 4) is a simile. The dissimilar concepts are "furnace" and "animal."

Elements of a Simile

The subject, the vehicle, the link and the commonality of which the simile consists are the four elements.

Subject. The subject of the simile is the word or words representing that which is being referred to or described by the simile. In the example above the subject is "furnace."

Vehicle. The word or words representing that to which the

subject is being likened is the vehicle of the simile. It is the means of carrying the reader to the tenor in its association with the subject of the simile. In the simile above the vehicle is "great sleepy animal."

<u>Link</u>. The word "as" or "like" used to associate the subject with the vehicle is the link.

<u>Commonalities</u>. This term applies to those qualities shared by both subject and vehicle which may or may not be stated or implied by the author. In the simile above the stated commonality is "purred."

Sequences of the Elements

The order in which the above elements occur in a particular simile is referred to as the sequence of the elements. In the example, "The furnace purred like a great, sleepy animal" (Engle, 1962, p. 4), the sequence is: subject, commonality, link, vehicle, which may be abbreviated as SCLV.

Tenor

This term applies to the author's overall meaning or the total impression he attempts to convey to the reader by means of the simile. This term will be frequently referred to though no attempt will be made in this study to interpret the tenors of similes.

SIGNIFICANCE OF THE STUDY

In identifying commonly recommended children's fiction and attempting to describe some characteristics of similes found in this

fiction, the present writer hoped to establish additional bases for further research. Perhaps knowing of certain traits of simile, other researchers may be able to investigate the relationships of these to certain difficulties in interpretation. They may be able, furthermore, to explore ways of overcoming some of these difficulties. This study also may spark the investigation of characteristics of other figures of speech.

Some of the findings of this study might benefit various educators. More knowledge of factors characteristic of simile may emphasize the importance of this figure of speech and may generate informed ideas of how to teach children to read similes effectively. The classroom teacher may find useful the list of fiction as a source from which to recommend books to children. By being better informed of some characteristics of similes that her pupils confront in their independent reading, she may be able to give them more direct assistance of a developmental nature during classroom instruction.

The remedial reading specialist may gain insight into some problems of comprehension arising from the reading of similes and thus be able to provide greater assistance.

With more information available about similes, greater emphasis could be placed in teacher education (both pre-service and in-service) upon teaching children to read these figures of speech.

This study may enable authors as well to become more aware of aspects of the simile which may enhance or distort meanings they wish to communicate to the child reader.

The writer feels this research is significant to the extent that it benefits the researcher, the educator, the author and thus ultimately, the child.

LIMITATIONS

The following were considered to be limitations in this study:

- 1. The compilers of the different lists were not completely in agreement as to what they considered to be fiction (for example, fairy tales) and/or suitable for children in the intermediate grades. So there were some contradictions in classifying books. However, such contradictions were infrequent.
- 2. Because information was not available about which book lists librarians preferred to use or how they used these lists, each book on each of the nine lists described in Chapter III was given equal consideration. Thus there may be some discrepancy between titles appearing in the compilation of book titles in Chapter III and the titles appearing in a particular school library.

Throughout the study more specific limitations will be noted.

ASSUMPTIONS

Assumptions were noted as follows:

1. It was assumed that books found on any three of the nine book lists or on both Canadian book lists recommended by the School of Library Science would be found commonly in Canadian elementary school libraries.

2. It was further assumed that children in grades four, five and six would read these books recommended for their age level.

Additional specific assumptions will be noted as they seem pertinent later on in this report.

OVERVIEW

The background of this study is given in Chapter II. This includes discussion of the reading phenomena involved when a child confronts a simile, the difficulties the child has reading similes and the particular bases for the research questions of this study.

In Chapter III the procedure for identifying fiction and the fiction thus identified is presented.

The procedure for the rest of the study is described in Chapter IV. This consists of the sampling of the books, the identifying of the similes in them, and the collecting and analyzing of the data for the description of similes.

The description of the similes is reported in Chapter V in three sections: the quantitative, qualitative and functional.

SUMMARY

In this chapter the reading problems of children when confronted by similes were briefly discussed. Little is known about these similes. In this study the researcher purposes to identify fiction suitable and recommended for children in the intermediate grades, and then to describe similes selected from this fiction. Ten research questions were posed, and terms were defined. The study was needed to assist the child indirectly to read similes by providing information about similes to researchers, classroom teachers, remedial reading specialists, professors training teachers and authors of children's books. Limitations and assumptions of the study were noted. Finally an overview of the remainder of the thesis was provided.

CHAPTER II

BACKGROUND OF THE STUDY

This chapter has three major divisions. The first concerns the complexities of communication between author and child reader when simile is the medium. Next, difficulties in simile reading and characteristics of the child related to these difficulties are discussed. Finally, the particular background for the research questions of the present study is reviewed.

Material for each of these sections came from three sources: research on the subject, relevant non-research literature by educators and specialists in literature, and the writer's preliminary studies and observations. Material from non-research sources at times predominates because of the scarcity of research.

COMMUNICATION VIA THE PRINTED SIMILE

Because this is a reading study in the field of elementary education, consideration of the reading phenomena involved when a child confronts a simile is relevant and essential as background to a description of these similes. Thus the general operation of simile in printed communication will be discussed before research questions are formed which attempt to describe similes authors use in their communication with child readers. Although, to the writer's knowledge, very little actual research has been done in this area, many specialists in

literature and education have speculated on how communication via the printed simile is effected.

An Overview of this Communication

Several writers in the fields of English and education have commented on communicating by simile.

The author forms the simile. In his search to express to the reader his impressions of something, the author may find that by likening it to another thing the message is transferred most effectively.

Now every two things are analogous in some respect but not every such respect is important . . . The notion of importance varies with the situation . . . If a given metaphorical statement is to be judged worthwhile or apt, the analogy suggested must be important with respect to criteria relevant to the context of the utterance (Scheffler, 1960, p. 48).

In other words, the vehicle must convey the author's ideas. Via the vehicle the subject is viewed from a single perspective. Every subject is multi-faceted. A vehicle, like a beam of light, may only illuminate a single facet of that subject; but it may be a very significant illumination nevertheless. The author, then, must choose a vehicle that will portray an aspect of the subject that is significant to him in a manner of his choosing. An evaluation of an author's choice of vehicle on the above basis is beyond the scope of this study.

The vehicle also must be distinctly different from the subject in order to establish an interesting simile relationship. Since the time of Aristotle, scholars have described metaphor and simile in terms of seeing similarity in the dissimilars (Wells, 1961, p. 22;

Philbrick, 1942, p. 36; Carpenter, 1967, p. 172; Nowottny, 1962, p. 53). In the present study the subjects and vehicles of similes were classified in categories. Whether or not the subject and vehicle of a simile occurred in different categories gave some indication of the extent of their dissimilarity and thus the interest of the simile.

So an author selects a vehicle dissimilar by nature from the subject that shares those significant qualities of the subject that he has experienced through his senses, reason or emotions and which he wishes to communicate to the reader (Spurgeon, 1935, p. 5).

The child reads the simile. For the child with adequate word analysis skills, whether or not a simile communicates the idea intended by the author partially depends on his experiences. If these have given him adequate understanding of the two terms to be compared and skill in the "intricacies of mental activity" (Armstrong, 1946, p. 10) necessary to simile reading, the reader may grasp the author's idea.

The reader pieces out the metaphor by something supplied or constructed from his own experience, according to the specifications given linguistically by the utterance in which the metaphor occurs (Nowottny, 1962, p. 59).

McKee (1948, p. 81) describes the process:

It should be clear that in reading figurative language, one must be well acquainted with the things to be compared; he must know enough about the characteristics of those things to sense the similarities between the things, and he must do the thinking needed in order to come close to the writer's intended meaning rather than to build the literal meaning or some other misunderstanding.

The Complex Processes

From the conceptual literature on the subject the writer has

developed the following description of the simile-reading processes and has noted some of the demands these make upon the child reader.

The author initially sets down the graphic symbols for the reader that state "This thing is like that thing"; for example, "snow like marshmallows."

snow	like		marshmallows
(SS)		← (SL)	→ (sv)
	SS	-	Symbol of the Subject
	SL	-	Symbol of the Link
	SV	-	Symbol of the Vehicle

FIGURE 1
GRAPHIC SYMBOLS OF A SIMILE

He may be sure that the graphic symbols he prints will be shared by a reader who is able to recognize and identify those symbols. Nowottny (1962, p. 50) observes that simile is a

linguistic phenomenon [and that] verbal machinery is logically distinguishable from the perception of likeness or analogy it conveys . . . The distinction is between a thought as such and its linguistic manifestation in a figure of speech.

Though the symbols of the "verbal machinery" be shared the author cannot assume that his thought will be. Watts (1944, p. 200) criticizes teachers who suppose "that an idea put into simple words is a simple idea."

An association appears in literature as a word linked with another word, but the mental process is by no means the linking of one word with another. Associations blossom into conscious expression because of their widespreading roots beneath the surface of consciousness (Armstrong, 1946, p. 105).

Thus Figure 1 may be further represented as Figure 2. (The meaning of the symbols remain the same in Figures 2-10 as they were in Figure 1).

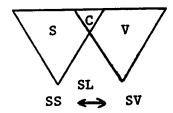

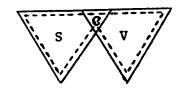

FIGURE 2

AUTHOR'S UNDERSTANDING OF THE SYMBOLS

Triangle S represents all the author understands of the subject and triangle V represents all the author understands of the vehicle. The overlapping area represents those common qualities that S and V share in the author's understanding—the commonalities of S and V.

Whether or not communication between the author and the reader takes place effectively via a particular simile depends on several factors. It partially depends on whether or not the child's understanding of the two terms being compared is similar to the author's understanding of those two terms. If this is the case the situation could be represented by Figure 3.

Author's understanding ______

FIGURE 3

CONTIGUOUS UNDERSTANDING OF TERMS

To use the example given earlier, when the child's understanding of the terms "snow" and "marshmallows" is identical to the author's understanding of those two terms, the situation may be represented by Figure 3. However, this situation is rather hypothetical. While individuals' understandings of words must be considerably contiguous for communication to be possible, word associations are a very personal matter. Probably no two people would have identical understanding of a single word. Unique word associations for each individual are a result of unique experiences interpreted in a unique way.

Nowottny (1962, p. 64) speaks of words bringing with them a "diffused aura."

What a word brings with it depends for each individual reader on his associations: his word-associations and his associations in the actual experiences of his own life. The poet can to some extent control the aura, by being careful what analogy he chooses and by carefully selecting the other words he uses in the passage.

. . . The well-chosen model . . . can contribute its associations to the effect of the passage.

simile's term or terms to be lacking, limited or inaccurate, respectively, as compared with the understanding of the author. Where the child's understanding of neither subject nor vehicle is relatively contiguous with the author's understanding, one would expect faulty communication. For the child whose understanding of "snow" and "marshmallows" is non-existent, limited or inaccurate, a comparison of the two to arrive at correct commonalities seems impossible. In this study the vocabulary used in similes was judged familiar or unfamiliar to children on the basis of the frequency with which children encounter these words in their over-all reading material. Other factors affecting the child's understanding of terms used in similes were not considered.

Even if the child's understanding of the subject and vehicle is adequate and accurate he may not discern commonalities of the two.

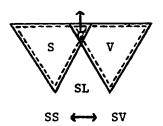

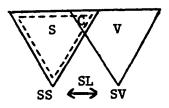

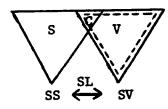

FIGURE 7

CHILD DOES NOT IDENTIFY COMMONALITIES

Or he may err by incorrectly assuming the author to mean that the unique qualities of one term are shared by the other when they are not.

Figures 4, 5 and 6 represent possible variations between the author and the reader in their understanding of a word or words linked in a simile situation. They show the child's understanding of a

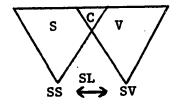

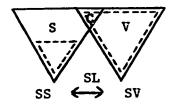

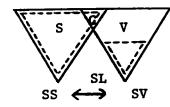

FIGURE 4

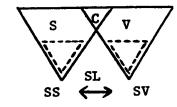

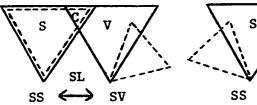

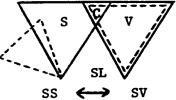

FIGURE 5

CHILD HAS INADEQUATE UNDERSTANDING OF SUBJECT AND/OR VEHICLE

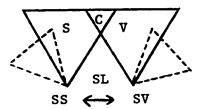

FIGURE 6

CHILD HAS INACCURATE UNDERSTANDING OF SUBJECT AND/OR VEHICLE

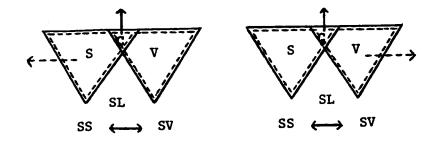

FIGURE 8

COMMONALITIES INCORRECTLY ASSUMED BY CHILD

Thus the child may incorrectly interpret "snow like marshmallows" to mean that marshmallows are very cold or that snow is sticky and sweet.

Philbrick (1942, p. 74) has noted that although metaphor cannot be avoided without avoiding thought itself, "the act of comparison leads to special dangers, notably that of pushing the comparison too far and of supposing that A, because it can be compared with B, is like it in all ways."

Watts (1944, pp. 198, 253) describes two functions of simile both of which are accompanied by such dangers for the child reader. Frequently analogy is used as an illustration. For example, "The world is round like an orange." However, Watts warns, while such an analogy may be valuable as an illustration, it cannot be depended upon to demonstrate or explain. The child does not necessarily understand what is meant by "The world is round" simply because he was given an illustration.

A second use of simile, Watts notes (1944, p. 209) is that of a basis from which to argue or reason.

Errors of inference in reasoning from analogy chiefly arise through pressing the analogy too closely in any case so that additional parallels are sought where true ones cannot be found When we argue from analogy, there is a danger of our making unwarranted inferences of this kind. The value of an analogy is that it <u>suggests</u> the existence of parallels where we have not perhaps suspected them: they provide us with hypotheses which must, however, be tested further before we can safely draw any conclusions.

Nor is the author probably wanting to emphasize all the commonalities of subject and vehicle. From the several existing commonalities he often wishes to stress a single commonality or a selected few that are significant to him. The author may state this commonality (or commonalities); he may imply them within the context surrounding the simile sentence; or he may use both techniques. At times the commonalities of subject and vehicle are neither stated nor implied. In this latter situation particularly where the reader independently must discern commonalities, he may have difficulty selecting correct commonalities which are relevant to the author's meaning.

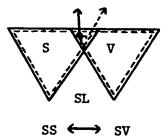

FIGURE 9

CHILD SELECTS IRRELEVANT COMMONALITY

In this study an attempt was made to distinguish whether or not the relevant commonalities of similes were stated and/or implied.

One of the outstanding characteristics of both good comparison and simile is that the picture evoked can be immediately deflected onto the actual fact, that is the reflection, the transposition, takes place during our actual reading (Holder-Barell, 1959, p. 18).

It is at this stage of grasping the author's tenor that the reader needs to be most wary.

It is inevitable from the very nature of language that choice of words implies choice of attitude, the choice of a certain kind of mental structure within which the object is seen . . . (Nowottny, 1962, p. 45).

In selection of the vehicle and commonalities the author is preselecting the point of view for the subject. It would seem imperative particularly in writing for children that the author transmit attitudes and form mental structures with the greatest of integrity and concern for clarity of fact (Philbrick, 1942, p. 38).

Philbrick (1942, p. 38) gives the example of "a writer who tells his readers that communism is 'growing like a fungus.'" Quite a different effect would be made if the writer had said "communism is blossoming like a rose." In a similar vein, Wells (1961, p. 13) warns the reader against metaphors that distort judgment and cloud the truth.

Metaphor is the first tool seized by the eulogist or the detractor. By the black art of metaphor damaging evidence is concealed, an outlook is confined, or the mind extravagantly prejudiced to praise or blame.

Later in his book Wells (1961, p. 28) writes, "An ideal figure . . . is one which appeals strongly to the imagination without offending the judgment." No attempt was made in this study to critically examine the intent of the author or the integrity with which he portrayed the subjects of his similes.

Some metaphors are particularly pregnant with meaning. "The richer and more suggestive a metaphor is, the more impossible it is to spell out explicitly all the similarities that underlie it" (Alston, 1964, p. 101).

The highest imaginative value in metaphor exists only when the mind is carried away by a particular scene to the comprehension of a wide range of suggestions. This condition is most generously fulfilled when the figure contains the germ of contemplation (Wells, 1961, p. 103).

No attempt was made in this study to measure the wideness of the range of commonalities suggested in similes.

If the child manages to get successfully past this stage of selecting not only correct but also pertinent commonalities, he has access to the tenor—the total impression that the author was attempting to convey when he stated the simile.

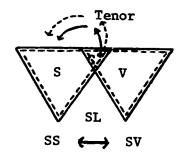

FIGURE 10

ARRIVING AT THE TENOR

The tenor in turn deflects the author's intended meaning onto the subject. The author then has successfully communicated to the reader. This entire process, though seemingly involved, may take place instantaneously and perhaps quite unconsciously during the time of the reader's encounter with the printed symbols of the simile.

selected for description in this study. Then in the final section of this chapter specific research questions were formed in an attempt to describe similes in the light of information about the operation of simile in printed communication and information about children's responses to it. Thus the information that follows about children's responses to printed similes provides justification for some of these research questions.

Evidence of Difficulty Children have in Reading Similes

Research reveals that communication between author and child reader is frequently blocked or distorted when simile is used. This evidence in addition to that presented in Chapter I prompted the present study to focus on similes which seem thus to generate reading difficulties. In the present study some characteristics of similes are described which may provide information about some of these difficulties noted by researchers. The following researchers found that children had difficulty reading figures of speech including similes.

Hollingsed. In addition to tallying the number of figures of speech in four series of basal readers for grades four to six, Hollingsed (1958) also attempted to measure the amount of instruction provided in the readers, manuals and workbooks to aid interpretation of these figures. The understanding of twenty-five of the figures of speech in one series by approximately one hundred children in each of grades four, five and six in one school was tested by him as well.

Summary

Thus it would seem from a review of the non-research literature and the writer's observations that for communication via simile to be effective, great demands are made upon the reader. Among these are demands for adequate and accurate vocabulary, ability to associate dissimilar terms to discover similarities between them, discernment for particular commonalities the author wishes to stress, realization of the author's purpose in creating the simile, and sensitivity in reacting to it. With this background about simile reading in general, children's difficulties as noted by researchers will be discussed.

DIFFICULTIES IN SIMILE READING

A considerable amount of information concerning difficulty in reading similes has been generated by research. This information is presented in this section corroborated by some discussion from literature of the non-research type. The three subdivisions under which this information is reported are: evidence of difficulty, characteristics of the child related to difficulty, and instructional attempts to overcome difficulty. Whereas in the foregoing section of this chapter the general operation of simile in printed communication was discussed, information regarding children's responses to similes is reviewed here. This study is concerned with identifying and describing similes. But the particular reading audience for whom these similes were intended cannot be ignored. What is known of the responses of children to similes necessarily must influence which aspects of similes are

The study is limited by the considerable subjectivity the researcher used in identifying and classifying the figures of speech, and most particularly in the designing of the three multiple-choice tests. The twenty-five figures of speech on each test were apparently not selected randomly. Nor did there seem to be regard for the pattern of their elements, familiarity of vocabulary, complexity of sentence structure, or other characteristics, although these might affect their probability of being interpreted successfully by children. Hollingsed does not inform us as to how or why the four alternatives for each question were formulated. He does say:

Figures of speech chosen to be included in the test are, in the judgment of the investigator, subject to misinterpretation by pupils. An effort was made to include the more common figures of speech such as metaphor, simile and personification to a greater degree than those forms of figurative language found more infrequently (p. 66).

Despite these limitations the fact that Hollingsed discovered so much difficulty in the interpretation of figures of speech by children in grades four, five and six cannot be ignored completely. A total of 4,428 correct responses were given of a possible 7,675—an accuracy of only 57.69 percent. Other researchers have also observed the difficulty children in upper elementary experience in interpreting figures of speech.

Holmes. Although neither Holmes' unpublished master's thesis of 1959 nor Flaum's unpublished field study of 1945 are immediately available for study and review, Groesbeck (1961, p. 16) reports their findings. Holmes, attempting to measure the extent of children's

knowledge of figurative language, individually tested twenty-six grade five pupils during personal interviews. The figurative expressions came from geography textbooks and basal readers. She found that 1,267 of 3,640 responses were "I don't know." Unfortunately, more information regarding the children tested, the figurative language used, and the testing procedure followed are not available.

Flaum. As reviewed by Groesbeck (1961, p. 16) and Hollingsed (1958, p. 6), Flaum (1945) for his study devised three multiple-choice tests for pupils in each of grades four, five and six. He was attempting to measure the understanding these pupils had for metaphors, similes and personification from basic history textbooks at the appropriate grade levels. On the basis of what he considered to be difficult, Flaum selected seventeen figurative expressions for grade four, fifty-six expressions for grade five, and sixty-four expressions for grade six. Using these expressions multiple-choice tests were constructed with five choices of answer for each item. The pupils tested numbered thirty from grade four, thirty-five from grade five, and thirty-one from grade six. From the results Flaum concluded that similes were more difficult than either metaphor or personification—correct interpretations being only 59.9 percent for simile.

However, Flaum's study is rather suspect for several reasons. His testing instruments were constructed subjectively, both in regard to the selection of items for the test and in the structuring of answers for each item. It can only be speculated how representative of the expressions in the text were the figurative expressions in the

and found the grade four children were more successful in verbalizing their interpretations than they were in responding to the multiple-choice test. This may indicate only that the choices of answer on the test were not suited to these children. Also what Flaum considered to be a successfully verbalized interpretation is not clear. On the basis of the results from the three tests, Flaum concluded that children's ability to interpret figurative language increases throughout the intermediate grades. However, the reliability of this conclusion too is open to question as Flaum's three tests may not have been comparable.

Burt. Burt (1971) used both multiple-choice test and interview techniques in assessing the understanding of similes in their contexts by grade five children. This study as companion to the present study, used the same fifty similes randomly selected from twenty books of children's fiction. She so constructed the five choices of answer for each item on the multiple-choice test that one fit each of five categories: correct response, inappropriate commonality response, confused relationship response, paraphrasing response, and incorrect response. Burt had established these categories after examining the free responses children gave when asked to interpret six similes during the preliminary studies carried out earlier by the present writer. Although she identified a total of nine categories of responses, the five categories mentioned above included over 93 percent of these free responses. Burt considered responses fitting the second, third and fourth categories mentioned

above to represent a partial understanding of the simile. She consulted other judges and The Teacher's Word Book of 30,000 Words

(Thorndike and Lorge, 1959) in the structuring and wording of the choices of answer, and then subjected this instrument to a pilot study which included all the children in three grade five classes. By test item analysis the best thirty items were selected. Thus revised, the test was then administered to seventy-four students in three heterogeneous grade five classes.

Nineteen grade five pupils, not having taken the multiplechoice test, were individually interviewed. This was done to ascertain
whether or not children have difficulty responding orally, and if, in
the opinion of three judges their responses would fit the response
categories used in the multiple-choice test. Ten similes randomly
selected from the multiple-choice test were used for this purpose.
The interviewer attempted to determine the child's understanding of
the simile, the source of the meaning given (either the simile context
or the experiential background of the child), the feelings the simile
elicited, and the understanding of vocabulary which had caused difficulty in the pilot study. The interviews were standardized as nearly
as possible by taping the questions asked of the child and his
responses to them.

Because of Burt's systematic attempt to make the choices of answer on the multiple-choice test representative of children's own responses, her pilot studies, her use of qualified judges at various times in making subjective judgments less so, and her use of other types of controls, this writer places considerable confidence in her

findings. Burt found that children made a greater percentage of correct responses on the multiple-choice test than they did in the interview, thus contradicting the findings of Flaum (1945). On the multiple-choice test correct responses totalled 65.3 percent, whereas in the interview the total of correct responses was 39.5 percent. Burt (1971, p. 91) suggests, therefore, that it is more difficult for a child to structure his own response than it is for him to select a pre-structured response. This writer would also like to point out that credit may be given for correct guesses on a multiple-choice test which is much more unlikely in an interview situation.

Although the studies above are limited in number and research design, the findings are consistent in reporting that children had difficulty in interpreting figurative language. On the basis of these studies it would seem that children misinterpret nearly half of the similes that they read. To this extent similes have failed to achieve their purpose of conveying the author's meaning.

In the present study then an analysis of all the similes in a single book was carried out in an attempt to describe their relative functional significance within that book. The author's ideas in some similes would seem to be more important than his ideas in other similes in the development of the total book. Whether or not the most significant similes are among those generally understood by children is a problem beyond the scope of this study.

Lockhart. This writer conducted two preliminary studies in the spring of 1969. Each study involved a grade four class. In each

case the children were asked to express their understanding of fourteen figures of speech which the researcher considered to be examples of metaphor, simile and personification. The figures of speech were selected from recent Newbery Award-winning books. None of these books had a readability level of higher than grade 5.0 according to the Dale-Chall Readability Formula as it was applied to ten evenly distributed samples of two hundred words from each book.

The first study was held in a classroom containing a heterogeneous group of children in Edmonton, Canada. To eliminate technical reading problems as completely as possible, the expressions were read aloud to the twenty-seven children as they followed the same material in printed copies. The children recorded their interpretation of each expression on paper.

In the second study twelve students were randomly selected for individual interviews from a grade four class in St. Albert, a town a few miles north of Edmonton. In this situation the same expressions were again read to each child while he followed the paper. His responses were made orally and recorded on tape.

Responses in both studies varied widely from those seeming to reveal considerable insight to very confused or "I don't know" responses. This evidence of children's difficulty in reading similes confirmed the evidence supplied by other research. Because the scope of the subject of figurative speech seemed so vast and the possibilities of research seemed so many, the decision was reached at that time to limit the focus of the present study to a description of one common

type of figurative expression, namely simile, as it was found in selected children's literature. It was hoped that such a description would expose some sources of difficulty that lie within the simile.

Characteristics of the Child Related to Difficulty

While this study is primarily concerned with a description of similes, the children for whom the similes are intended must be considered. They read the similes. Unless similes are written by authors who keep in mind what is known about children, much communication may be lost. Researchers have attempted to identify characteristics of the child that seem to be related to success or failure in simile interpretation. To be realistic the expectations of authors in writing similes for children should take such information about their readers into account. Some of these characteristics of children affected particular aspects of the description of the similes. Others were beyond the scope of this study.

The child's intellectual and reading abilities. Various researchers have affirmed that these two factors contribute to the ease or difficulty with which a child can interpret simile.

1. Groesbeck. Groesbeck's study in 1961 had three dimensions. In the experimental aspect she attempted to measure the ability of children in third, fourth, and fifth grades to transfer skills of interpreting figurative language that she had deliberately taught in a series of lessons. She also sought to determine the nature and extent of the figurative language that occurred in two series of basal

readers and one series of social studies textbooks written for grades three, four and five. Her study was designed furthermore to determine relationships between children's knowledge of figurative language and their vocabulary, reading ability, intelligence quotient and sex. The first two aspects of Groesbeck's study will be discussed later in this chapter.

The third aspect of Groesbeck's study, in which she attempted to determine certain characteristics of the child related to his success in interpreting figurative language, is of immediate concern. Knowledge of figurative language was measured by a multiple-choice test that Groesbeck had designed for this purpose. Each item was read aloud by the examiner while the child followed on the paper to minimize differences in reading skills. The rationale Groesbeck used in constructing the three choices of answer to each item on her multiple-choice test is not apparent. Some of the choices may have presented additional complications to the reader, such as those that repeated a phrase of the figurative expression or contained another figurative expression. It is difficult to assess how well the selected responses reflected the children's own interpretations.

As measured by this test, positive relationships between the knowledge of figurative language and intelligence quotient, reading ability, and vocabulary level were noted. Reading ability and vocabulary level were no greater predictors of success in understanding figurative language than was intelligence quotient.

2. Horne. Another experimental study was carried out in 1966 by Horne. She initially used grade six as the level at which children

(according to the consensus of opinion in the literature) could be expected to understand and produce figurative language. Later in this study a review will be made of Horne's procedures and findings when she attempted to determine whether or not her activities, centered around excerpts from children's literature, would affect their understanding and use of figurative language. As did Groesbeck, so Horne devised a multiple-choice test to discriminate between those who had an understanding of figures of speech encountered in context and those who did not. Horne based the three choices of answer for each figurative expression on the free responses of grades five, six and seven children when asked to write the meaning of the figurative expression. Horne did not attempt to classify the two wrong choices for each item, nor is it clear how the free responses were used. No mention is made of any effort to control the researcher's subjectivity in constructing the test either by consultation with other informed persons or trial of the test by pilot study.

Horne administered this test to seventy-three grade six pupils in the experimental group and seventy-two pupils in the control group. From samples of the creative writing of these children in response to viewing the film, "The Hunter and the Forest," she calculated the number of figures of speech they used. Horne also collected information on each child's age, sex, intelligence quotient, reading comprehension and vocabulary.

Horne's findings supported those of Groesbeck in that she found that intelligence quotient, reading vocabulary and comprehension were positively related to a child's understanding and use of

figurative language. Horne did not find any statistically significant differences between children of different sexes or of different socio-economic levels in their understanding and use of figurative language.

3. Looby. Looby (1939) used several tests to investigate the understanding of seventy-seven grade six children to words and phrases found in the last part of the literary selection, "Achilles, Famous Leader of the Greeks" by Alfred J. Church. Looby previously had taught the first part. What effect her teaching may have had on the children's interpretation of the second part is open to speculation. Figurative language was included among these words and phrases which Looby tested. She found that children did not understand nearly two fifths of the words and phrases that they encountered in this piece of literature. Looby provided little information about her choice of tests to measure this understanding other than that they were "several," one of which was a personal interview with each child. Thus any evaluation of the validity of her study is difficult to make.

On the basis of scores from a standardized reading test and a recognized standard intelligence test, Looby attempted to measure the relationship between the child's ability to understand words and phrases found in literature and his reading comprehension and mental ability. She found positive correlations of 0.866 and 0.802 respectively. She also found that the more intelligent children tended to make greater use of context when interpreting words and phrases.

Unfortunately, Looby did not relate how she measured "use of context."

4. Watts and Hollingsed. Watts (1944, pp. 204, 207) found that the more intelligent ten-year-olds had success with analogies;

Hollingsed (1958, p. 89) found that the less intelligent children in his study experienced more difficulty with the figurative language test.

5. Burt. Burt (1971) found the strongest positive correlations existed between reading ability as measured by <u>STEP</u>, the verbal and total mental ability scores as measured by the <u>Lorge-Thorndike</u>

Intelligence Test and the correct score on the <u>Similes Test</u>. She pointed out that this was to be expected because of "the reading component in all three variables" (p. 102). She found no significant relationship between the child's sex and his ability to select correct responses on the <u>Similes Test</u>.

From these findings it would seem that the vocabulary selected and the ideas to be communicated in a simile need to be suited realistically to the probable reading vocabulary and level of comprehension of the potential readers. In the present study the vocabulary used in similes was checked against Thorndike and Lorge's The Teacher's Word Book of 30,000 Words to ascertain whether or not it occurs with sufficient frequency in children's reading material to be considered familiar to children. This was part of research question eight.

That intelligence is a significant factor in the process of interpreting similes is supported by the non-research literature as well as the research.

Walpole (1941, p. 144) constructs what he considers to be

quite a workable definition of 'intelligence': the ability to see the unique qualities of an object as well as those it shares with other objects; the capacity to compare two things without confusing them; a faculty for

using metaphorical language while remaining conscious that it is metaphorical; . . . the ability to recognize the tenor as well as the vehicle of every metaphor we employ

Philbrick (1942, p. 36) notes:

It is quite wrong to suppose that metaphors and similes are mere ornaments or flowers of speech, for much of our thinking may be described as the comparing of one thing, or one relation, with another, so that the mechanism of the simile or metaphor is the mechanism of thought itself. Probably this is what Aristotle had in mine when he said, 'The greatest thing of all is to be a master of metaphor. It is the only thing that cannot be learned from others; it is also a sign of original genius, since a good metaphor implies the intuitive perception of the similarity in dissimilars.'

In composing similes in books for children, writers need to recognize the level of intelligence of the children with whom they hope to communicate. In this writer's opinion the bulk of similes should be neither overly sophisticated nor trite, but intellectually stimulating while within the reach of the majority of would-be readers. An investigation of the suitability of similes to the intellectual development of children is beyond the direct scope of this study though implications stimulating further research in this direction may arise.

The child's experience. The child's experience also seems to be an important factor in his ability to interpret simile. This factor affected research question seven of this study. When individually interviewing the children, Looby (1939, p. 61) found that some children used their background of experience in gaining meanings for particular words and phrases.

Meanings seemed to be uniformly more numerous and correct among children who read or conversed a great deal, and among

children who were fond of writing stories and poems and participating in plays.

Some of these children, she notes, had only an average intelligence quotient of between 100 and 103. Based on his observations of the way in which children under the age of eleven reason badly from analogies, Watts (1955, p. 253) suggests that it is because they lack the experience to check their conclusions.

In an attempt to assess the background experiences of the ninety-three pupils tested by the multiple-choice test or the interview, Burt (1971) structured a questionnaire. Information in the following areas was sought: personal experiences, vicarious experiences, reading experiences, availability of books, and preferential use of leisure time. Six graduate students in reading with teaching experience at the upper elementary school level critically read the questionnaire to check for its clarity, specificity and grammatical consistency. Four grade five children suggested some further changes. All ninety-three children in the test population completed the questionnaire.

Burt found that some experiences, particularly reading experiences, were positively related (though not significant statistically) to the number of correct responses on the <u>Similes Test</u>. The children who indicated that they regularly read the newspaper, had fifty or more books in their home, borrowed books weekly from a library, read books each week, or owned books had a higher mean correct score than the children who indicated otherwise.

After each of the nineteen children in Burt's study had

interpreted a simile in the interview, he was asked how he knew what the simile meant. The sources from which children derived clues for their interpretations were classified. Burt's findings are graphically shown in Figure 11.

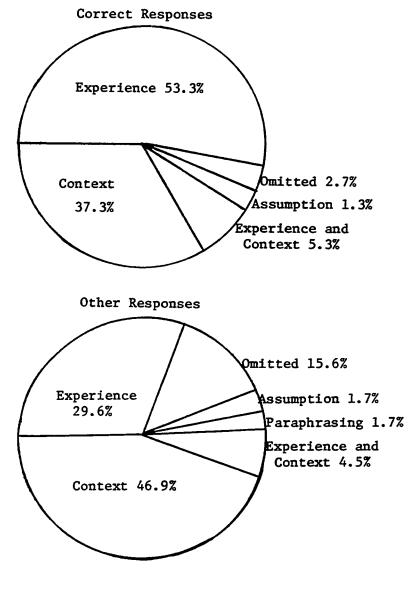

FIGURE 11

SOURCES OF CLUES FOR MEANING RESPONSES OF STUDENTS TO SIMILES ON BURT'S INTERVIEW

Burt found that children frequently drew on their experiential background when interpreting similes. Clues for correct responses were derived from experiences (53.3 percent) nearly twice as often as were experience clues for other responses (29.6 percent).

The child's development of reading understanding of similes. Though it could not be extensively investigated in this study, similes in books for children in the intermediate grades should be suitable to the level of development that has been attained by children of this age. It was hoped that through the qualitative description of similes in this study information might be forthcoming about this concern at least indirectly. At what stage of development of understanding of similes are children in the intermediate grades? What can justifiably be expected of them? Though not involved in research, Barfield (1927, p. 87) identifies two trends in the development of consciousness in mankind. The first is that of separating concepts according to their unique characteristics; the second is classifying them according to that which they have in common. It would seem that individual children may undergo similar processes in their language development. The young child distinguishes between concepts as he learns to note differences and discriminate on that basis. However, on the basis of resemblances he learns to group concepts. At this stage it would seem the child is ready to think metaphorically through a "clear intuition of resemblances rather than from a confusion of identities" (Watts, 1944, p. 204). For example, while the two-year old child who calls a sailboat a "birdie" is likely erroneously confusing the identities of two

dissimilar items; the older child, able to think metaphorically, may be aware of a common wing-like structure or skimming motion while recognizing the distinctiveness of the two concepts.

Thus it would seem that the ability to interpret similes may grow as the child develops in other areas.

Hollingsed (1958), Flaum (1945), Groesbeck (1961), Croxton (1936), and Richardson and Church (1959), all concluded from their research that interpretive ability consistently increased with chronological age. What then can authors expect of readers at the ages of nine to eleven in the intermediate grades?

The investigation of Asch and Nerlove explored the understanding children had of terms such as "hard", "deep" and "bright," that could function both in a physical or a psychological sense.

These researchers felt that such "double function" terms were an elementary instance of metaphorical language. They questioned whether children developed understanding of such terms first in their physical sense or in their psychological sense or simultaneously in both senses.

They set out to establish the meanings that children at different age levels (from three to twelve) held for certain double function terms. Five groups of ten children were directly questioned about their understanding of eight double function terms. Asch and Nerlove do not report how adequately children understood these terms in their physical sense. However, children seemed to grasp first the physical sense in which these terms could be used. The understanding of the psychological sense of these words increased at each age level as did

the understanding of the relationship between the psychological and the physical senses of these terms as shown in Table 1.

TABLE 1
CHILDREN'S UNDERSTANDING OF DOUBLE FUNCTION TERMS

Age Group	Understood Psychological Meanings	Comprehended relation of psychological and physical meanings	
3 - 4	-	-	
5 - 6	13%	40%	
7 - 8	59%	36%	
9 - 10	90%	44%	
11 - 12	96%	81%	

However, Asch and Nerlove speculated that the psychological understanding of terms apparently developed independently of the understanding of the physical sense. The realization that these terms have a dual property does not come until later (between the ages of nine and twelve).

In Asch and Nerlove's study many variables were uncontrolled. The method of questioning varied at the different age levels, and it is not clear how the researchers decided whether a child's response showed adequate understanding of the psychological sense of a term or of the relationship between the psychological and physical senses of the term. However, some information about the development of children's understanding seemed to be indicated. If this type of

understanding is necessary to the development of metaphorical thinking, children between the ages of nine and twelve are in a critical stage in the development of this kind of awareness.

Piaget (Maier, 1965, p. 125) describes the period between seven and eleven years of age as one of concrete operations in which the child "cannot perform mental operations unless he can concretely observe their inner logicality." However, during the formal operational phase between eleven and fifteen years of age "the adolescent moves boldly through the realm of the hypothetical" (Flavell, 1963, p. 205). He is now sufficiently mature to form propositions and test them logically to prove or disprove them. This ability would seem crucial to simile interpretation when the author states that two things are alike. The reader is expected to propose various possible ways in which there is likeness. He then retains or discards these possibilities as he reasons his way through to conclusions that are logical and in keeping with the author's intent. Accuracy of reasoning in the younger child suffers due to lack of adaptation. Later simple schemas "will be submitted to a rigorous selection . . . which will sharpen then into first-rate instruments of invention in spheres of thought where hypotheses are of use" (Piaget, 1955, p. 168).

Piaget (1955, p. 161) gave nine eleven-year olds a multiplechoice test suited for and used with eleven to fifteen-year olds. The child was asked to select the sentence which corresponded in meaning to the proverb. Piaget remarked that the proverbs were "verbally understood, i.e. that in reading them the child has a concrete idea of their meaning, missing only their moral significance." This phenomenon, Piaget (p. 164) points out, is due to a lack of adaptation. The child merely "assimilates everything . . . to his own point of view and to his own stock of information." He distorts the ideas he receives to fit his own schemas. "In the majority of the cases the children did not understand the proverbs in the least, but they thought they had understood them" (p. 142). Looby (1939, p. 61) also found "evidence that children are very sure in their own minds that they know what words and phrases mean. They are quite as positive when their understandings are wrong as when they are right." Asch and Nerlove (1967) too found that young children insisted that such double function terms as "hard" and "warm" could not possibly apply to persons.

Discussing his work with children, Arnstein (1962, pp. 58, 59) notes that while a child at a very early age senses a need for comparison and spontaneously employs imagery (though it is often faulty), he has not yet arrived at the precise concept of an image.

However, by the age of ten or thereabouts children are not only able to grasp the concept of an image but are avid in identifying these in poems they read. They are ready to discuss the value the particular simile lends to the poems, and they make increasing use of imagery in their own writing.

These observations are confirmed by the research findings of Hollingsed (1958) and Flaum (1945), summarized below as percentages of accuracy of interpretation of similes:

	Grade 4	Grade 5	Grade 6
Hollingsed	51.26%	56.80%	65.68%
Flaum	42.20%	_	70.10%

The evidence is that interpretive ability consistently increases as children progress through the intermediate grades.

The selection of books in the present study has been restricted to those recommended for grades four, five and six pupils. Children at this stage with their limited (albeit developing) facility for interpreting similes, encounter them in their reading material nevertheless. This study will attempt to identify and describe some characteristics of the similes that children read at this critical stage of their development.

Summary. It seems that when children have an adequate vocabulary, reading comprehension, intelligence, a wealth of language experiences and sufficient maturity, they tend to have better success in interpreting figurative language than those children who have not acquired these resources to the same extent. Perhaps conversely it may also be true that similes written in a manner suited to the child's vocabulary, reading comprehension, intellectual development, language experiences and maturation, will communicate the author's tenor to the child more effectively than a simile which is unsuited. Whether or not similes are suitable on some of these grounds may become apparent through the description of them in this study. However, empirical research beyond this study is necessary to distinguish between similes suited to most children on the above basis and similes which are not.

Instruction to Overcome Difficulties in Simile Reading

<u>Instruction is necessary</u>. Enabling children to obtain the meaning of figures of speech has long been recognized to be part of the educators' responsibility.

Squire (1962, p. 536) laments that children are not being educated to the forms of expression.

We have spent so much time on the 'what' in communication that we have sometimes overlooked the 'how'. To the extent that we have done this, we have failed to see that form and content are essentially one, and that in overstressing the meaning of ideas we have shamefully neglected the structure of the ideas, which in themselves define and illuminate the message that is being communicated.

Jenkins (1964, p. 781) comments on the subject:

A child should be taught that language has nuances, subtleties, and intricacies. He should learn to recognize these and to understand how they create differences in the author's intent and effect.

Jenkins postulates that children's literature provides a natural field for such instruction.

Having determined the high frequency of figurative language in fifteen basal reading texts for children in grades four, five and six, Hollingsed (1958) surveyed these readers, the accompanying manuals and workbooks for their attempts to teach pupils to interpret figures of speech. He discovered that no formal lessons or practise items were found in the readers themselves although there were a few parenthetical or supplementary remarks. One series provided two or three lessons on metaphor for each grade level in the teachers' manual. The same series provided one or two lessons for each grade in the workbook. Each

series provided some practise exercises in interpreting figures of speech, primarily metaphor (p. v). It would appear that if these basal reading programs are any indication, adequate instruction for interpreting figurative language is not provided for in this type of reading program. Thus it would appear that such instruction would depend on the initiative of the teacher who may or may not have an adequate understanding of these figures of speech. Part of the significance of this study is that further information about similes may generate ideas about how to teach children to read them. Several attempts to teach children to read figures of speech including similes have been made. Some of these attempts apparently have been successful while others have been less so. Some of the information about instruction is discussed below. Hopefully some of the findings from this study will in the future facilitate such instruction.

It would seem imperative that the reading program undertake the development of skill in reading figurative language particularly at the intermediate level. As will be noted later in greater detail, it is at this stage that children encounter an increasingly vast number of figurative expressions in their reading material (Hollingsed, 1958; Groesbeck, 1961).

And it is also at this time that children with adequate intelligence, language ability, and experiences have matured sufficiently to benefit from such instruction in interpretation. Knowing more about these similes may enable instructors to be more effective in teaching children to read them.

Instruction may be profitable. Several researchers have attempted to measure the effect of instruction upon children's ability to interpret figurative language. A major concern of Groesbeck's study (1961) was measuring the ability of third, fourth and fifth grade pupils to transfer skills of interpretation which they had been taught to new figures of speech.

Two public schools in Kansas of comparable racial and socioeconomic background were involved in Groesbeck's experimental study.

A group of sixty third, fourth and fifth grade children of one school
formed the experimental group, while sixty third, fourth and fifth
grade children of the other school formed the control group. The
children were pre-tested for their knowledge of figurative language
with the test Groesbeck had designed for this purpose as discussed
earlier in this chapter. The experimental group received a total of
two hundred minutes of instruction over a period of five weeks in two
lessons per week.

The figurative expressions used for instruction came from outside the social studies texts and basal readers used at the school and which Groesbeck had analyzed quantitatively. Through a variety of learning experiences she attempted to teach the children in the experimental group to expect figures of speech, recognize them, interpret them, and appreciate their effect.

Four weeks elapsed between the instruction of the experimental group and the post-tests of both groups.

"The difference between the groups was statistically

of figurative expressions, Horne administered the <u>Test of Understanding</u>
of Figures of Speech mentioned earlier in this chapter which she had
devised for this purpose.

The post-test scores of the experimental group were significantly higher on this latter test than were those of the control group. The control group used a total of one figure of speech in the first free-writing sample and five in the second, whereas the experimental group used a total of five in the original free-writing samples and 199 in the samples after the instruction.

It is interesting to note that 139 of the 199 figures of speech used in the post-test by the experimental group were similes which may indicate that this figure of speech may be useful particularly to children at this age level. In 1962, Groff also had found that children used simile extensively in comparison to their use of metaphor.

Of the figures of speech in poetry written by upper elementary children, 22 to 33 percent were similes, while 7 to 8 percent were metaphors.

<u>Instruction may not be profitable</u>. Watts (1944, p. 252) adds a word of caution to the above optimistic findings on the benefit of instruction for interpreting similes.

The attempt to teach children to understand and use metaphor before they are mature enough to require it for their own purposes is largely futile. The common practise of introducing figurative language to children for ornamental value is misconceived.

He observes that six months following such premature instruction no evidence of such instruction can be found in the written work of the child.

significant beyond the .001 level in favour of the experimental group" (Groesbeck, 1961, p. 60). She also found that the grade five children profited considerably more from instruction than did the grades three and four children. The grade five children in the experimental group made a gain of 8.2 points in comparison to the 6.5 points gained by both grades three and four children over the corresponding control groups.

Groesbeck provides little information as to her rationale behind the structuring of her teaching program. In attempting to achieve her objectives she used such means as drama, drawing, discussion and games. It is possible that had more time been allowed to elapse between the termination of instruction and the post-test, the results might not have been so significant. Nevertheless, this finding would seem to indicate that children's ability to profit from instruction in interpreting figurative language increases as they progress through the intermediate grades. Perhaps it was due to certain factors related to success that were noted earlier such as increased language facility and experiences along with greater maturation.

In 1966, Horne sought to foster the understanding and use of figurative language by sixth grade pupils through activities centred around excerpts from children's literature. To pre-test and post-test children's use of figures of speech, Horne obtained from each child free writing samples which were analyzed for frequency of figures of speech. At the same time, in order to check children's understanding

Summary

It seems apparent that interpreting figurative language is often difficult for children in the intermediate grades. While instruction to overcome these difficulties seems necessary, such instruction must have certain characteristics. It must take into account the child's language ability, intelligence, experiential background and maturation. It must be so taught that the skills become highly useful to the child as they facilitate both his receptive and expressive communication.

So far, little research has been done investigating specific figures of speech themselves such as simile. There is evidence that vocabulary, context and sentence structure may be important to the facility with which a simile is interpreted. As research reveals more of the characteristics of similes, their environment in the text, and their roles in communication, educators may be better informed to give effective instruction in interpretation.

SPECIFIC BACKGROUND FOR RESEARCH QUESTIONS

Discussed in this section is the rationale behind each research question posed in this study. While most of the questions have research as the basis, non-research literature will be presented as it lends support.

Fiction as the Source of Similes and its Identification

Explained in this section is the rationale behind the selection

of fiction as the source of the similes described in this study. However, before fiction could be used it had to be identified. Because it was not known what fiction Canadian children in the intermediate grades read, a major purpose of this study was to identify titles of fiction commonly recommended for Canadian elementary school libraries. This concern was expressed in research question one.

Materials from which researchers have drawn figurative language in order to study it are diverse. In 1958, Hollingsed counted
eleven types of figures of speech as they occurred in four basal
reading series written for grades four, five and six. At that time
these series had been recently published and were in current use.

A major purpose of Groesbeck's study in 1961 was to determine how much and what kind of figurative language was to be found in textbooks comprising two series of third, fourth and fifth grade readers (a total of eight books), and a series of social studies textbooks, one for each of the same grades. Groesbeck does not state the origin of the figurative expressions that she used in her instruction of the experimental group. However, they were not taken from the social studies or reading series mentioned above.

In 1945 Flaum examined the history texts used in a small Nebraska town by grade four, five and six classes to determine what figures of speech they contained.

As outlined by Groesbeck (1961, p. 20), Ayer's study in 1926 also drew on history books at the grade five level.

The above studies were all concerned with figurative language found in basal readers and textbooks. By selecting fiction as the

source of the sample for the present study, the writer points out
three areas of difference: the availability of the books to children,
the function of the figures of speech, the amount of independence
with which the child is expected to interpret these figures of speech.

Basal readers and textbooks are often limited in their availability to children as compared to popular children's fiction. Frequently after a life span of just a few years the former are considered to be out of date. Generally only children attending school in areas where these books are used ever read them. Such a book may be accessible to a child only during the year in which it is studied.

Textbooks are most commonly used for instruction. Figures of speech in them may often be contrived or technical either aimed at reinforcing a reading skill as in the case of the basal reader, or at transmitting factual material. Many writers of fiction, on the other hand, use figurative language as one means of conveying to the reader their perceptions, emotions and reasoning about a subject.

Because the teacher is concerned that the child learn the important concepts and skills set out in the text, he often may not leave the child to guess the author's intended meanings. However, in reading fiction available to him through the school library, the child frequently has only himself to depend on for discovering the author's meanings unless the teacher is using this fiction in the class, for example, as resource material for social studies.

By way of summary fiction recommended for school libraries rather than textbook material was selected for this study for several

reasons. For a good number of years many of these books will be in elementary school libraries across Canada and thus available to children for at least the years that they spend in these elementary schools. Thus the possibility of many children reading these books is considerable. Authors of these books employ figures of speech. Children are expected largely to be self-sufficient in deriving the author's meaning from these figures of speech. There seems a dearth of research using figures of speech from children's literature as its source.

While Looby (1939) used a literary selection, she limited herself to one--"Achilles, Famous Leader of the Greeks" by Alfred J. Church.

In 1966 Horne attempted to use excerpts from children's literature with sixth grade pupils. Twenty-four work sessions were held in each of three experimental classes over a period of six months. Her seemingly successful approach was aimed at promoting children's enjoyment of good stories, their understanding of the nature of figurative language, and their skill in developing their own figurative language. However, Horne did not attempt to identify literature that was particularly available to children or use selections that were representative of such literature.

One other area of past investigation is the writing of children themselves. In 1962 Groff investigated figures of speech in 540 original poems voluntarily submitted by children in intermediate grades from sixty-one schools. He notes that personification and simile made up

three quarters of the total number of figures of speech used. Groff's was not a controlled study so his findings cannot be generalized to other situations. Nor was his study concerned with figurative language with which children are confronted in the reading situation.

Thus it seemed of prime importance to this study that fiction considered suitable for and available to grade four, five and six children first be identified and then be used as a source from which to draw similes in this survey.

Quantitative Description of Similes

Significance of similes. Simile, which many writers include in their discussion of metaphor, is fundamental to language. Among these writers, Walpole (1941) makes some interesting comments:

Metaphor plays a part in our simplest acts of perception: the effects upon our nerves of new sights and sounds and smells are quickly compared with our memories of similar effects in the past (p. 142).

These comparisons may be emotional or intellectual, he suggests.

All of us speak constantly in metaphors. Whenever we do so, we concentrate upon a few of the vehicle's characteristics; but its other qualities hang around on the fringes of our minds, and so we often get more kick from a metaphorical word than from a literal one (pp. 154, 155).

Walpole suggests that the reason many people communicate poorly is because they do not make effective use of metaphor.

Perhaps we pause and search for recondite synonyms when an apt and simple metaphor could drive the nail firmly home. We are weak not because our vocabulary is inadequate, but because we are stale in the way we use it (p. 156).

He further contends, that metaphor "is not an extra beauty stuck on

to language--it is language . . . " (p. 154).

Thus simile may be involved in one's perception of a situation, in the thinking processes following the perception, as well as in the expression of those thoughts. This study is concerned with similes as they are expressed in the written mode to be read by children. If simile is indeed an integral part of language, the present writer expects to find it prevalent in fiction for children. This anticipation of the prevalence of similes is reflected in the quantitative description and specifically expressed in research questions two, three and four.

Number of similes. Researchers have attempted to identify and measure quantitatively figures of speech in other types of material written for children. In 1958 Hollingsed analyzed four basal reading series for grades four, five and six (a total of twelve books) to assess the number of occurrences of eleven types of figures of speech. His findings are shown below:

	Grade 4	Grade 5	Grade 6
Total number of figures of speech	519	703	908
Total number of similes	138	184	216
Mean number of similes per book	34	46	54

The number of figures of speech consistently increased from grades four to six.

While Groesbeck (1961) did not tally the occurrences of each

specific figure of speech, she did total the number of figurative expressions in eleven elementary reading and social studies textbooks for grades three, four and five as follows:

	Grade 3	Grade 4	Grade 5
Total number of figures of speech	985	1,260	1,893

Groesbeck's analysis included two basal reading series and one series of social studies textbooks for each of the three grades. As did Hollingsed, so also Groesbeck found an increase in the quantity of figures of speech from the lower to the higher grade level. This was particularly evident in the social studies textbooks.

ously been analyzed in a systematic way for the number of similes it contains. The more frequent the occurrence of similes the more essential it is that educators be informed about them because children are to that extent having to read them. Hence the significance of this study as a description of similes. Thus it seemed imperative that in describing similes for the present study, some indication be obtained of how often intermediate grade children may confront a simile in this phase of their reading experience. Question two expressed this concern.

Density of similes. In their identification and count of figures of speech, neither Hollingsed (1958) nor Groesbeck (1961) considered the actual density of figurative expressions and so in noting the increase in occurrence of figurative expressions from one

grade level to another, caution needs to be exercised. Certain factors have not been taken into account. It may have been the case that the print was smaller, the pictures fewer and the pages more numerous at each succeeding grade level. Thus, while the number of figurative expressions to be read increased at each grade level, it may only have been proportional to the increase in the number of words in books at each level.

Thus to facilitate accuracy in measuring the frequency with which similes occur in the text, it would seem necessary in the present study to measure the density of similes in portions of set size.

By calculating the density of similes per page, the writer controlled the variable of the number of pages in a book. Also it was thus possible to consider the total number of similes and the total number of pages in a book.

To control such variables as size of print and number of pictures, the number of similes occurring within a definite number of words was calculated by using sampling techniques. By controlling these variables it was surmised that a more accurate comparison was possible of the quantities of similes in recent and older books. This comparison was done to detect possible trends in authors' frequency of simile usage. This comparison constituted research question three.

<u>Distribution of similes</u>. One advantage of having identified all the similes in all twenty books was that a study of the ways in which authors distributed these figures of speech throughout the books

was then possible. To the writer's knowledge there is no research to indicate whether or not authors distribute similes fairly evenly throughout a book. To know in what quantities children encountered similes at one time was important. In question four the writer first asked whether or not authors made greater use of similes in certain sections of their stories than in others. The books were divided into small manageable sections. It was hoped that these divisions were sufficiently small to indicate any tendency authors may have to place the bulk of their similes in a particular part of the book. Whether or not similes are particularly prolific on some pages was the second query. The writer was concerned that for a child who had difficulty reading similes, to encounter several in close succession would compound his difficulties. For this child such reading comprehension difficulties extended over a page might contribute to a critical loss of the author's train of thought. Whether or not authors sometimes presented two or more similes in rapid succession (or in "clusters") was the final part of this question. As with more than one simile on a page so with simile clusters comprehension difficulties may multiply. The child may not have a chance to reorient his thinking if he plunges right from one simile into another.

Qualitative Description of Similes

Patterns of the elements. In a preliminary study conducted by the present writer in 1970, all the similes in two recent Newbery

Award-winning books were investigated. It was noted that these authors

constructed similes in a variety of patterns—some seemingly more complicated than others. It was apparent that the elements of a simile could be arranged and related in different ways, some perhaps more difficult for children to read than others. The present study attempted to identify some of the common patterns as anticipated in research question five.

Commonalities stated or implied. As was discussed earlier in this chapter, to understand a simile adequately, the reader must comprehend commonalities of the subject and vehicle that are pertinent to the author's meaning. During the preliminary study with similes from Newbery Award-winning books the writer became aware that the author frequently aided the reader in identifying the qualities that subject and vehicle had in common. Sometimes these commonalities are directly stated, for example, "Snow is like soft white marshmallows." Or they emerge from the larger context of the simile in which commonalities are implied. In other similes neither type of aid is available to the reader. In question six of this study the writer attempted to ascertain the frequency with which authors provided aid to the reader in identifying commonalities either by direct statement or contextual implication.

Subjects and Vehicles. Hollingsed (1958) attempted to classify similes from basal readers according to that which they described.

Table 2 shows the percentages of similes that were used to describe five types of concepts.

TABLE 2
HOLLINGSED'S CLASSIFICATION OF SIMILES
ACCORDING TO WHAT THEY DESCRIBE

Concepts Described	Grade 4	Grade 5	Grade 6
People	29.71%	29.35%	20.37%
Animals	20.29%	23.91%	18.98%
Objects	20.29%	20.11%	30.09%
Actions	17.39%	15.22%	17.59%
Conditions	12.32%	11.41%	12.97%

These five categories are not mutually exclusive nor does Hollingsed define the criteria for each category. However, on the basis of the above analysis it appears that in the four reading series concerned similes are primarily used to describe people, animals and objects.

In the present study, the writer has adapted Hollingsed's categories and defined them in order to classify similes in the selected fiction according to that which they describe (subject) as well as the concept used to describe them (vehicle). In revising Hollingsed's categories, similes from the Newbery Award-winning books used in the preliminary study were analyzed.

Ullmann's remarks (cited by Nowottny, 1962, p. 53) directed primarily toward metaphor could also apply to simile. He discusses the necessity of distance between subject and vehicle. "They must

belong to different spheres of thought." Thus, distance between subjects and their vehicles in the similes occurring in children's fiction is of interest to the present study. Richards (cited by Nowottny, 1962, p. 50) observes that "the interest of a metaphor usually depends as much on disparity between the two members related by a metaphor as on their likeness."

Classifying the subjects and vehicles of similes in this study as indicated in research question seven may result in some indications as to how much disparity exists between the two. It may reveal also what type of concepts children are most likely to encounter in a simile situation.

Familiarity of vocabulary. Looby (1939) investigated the wrong meanings children gave for words and phrases in literature and suggested possible reasons for these meanings. Because of insufficient data, no assessment of objectivity can be made of Looby's classification of wrong responses and her attempts to identify their cause.

Nevertheless, Looby suggests some interesting ideas based on her findings. She suggested that many incorrect responses seemed to result from wrong associations. For example, children thought "slew" meant "a pond." Children made other errors as a result of ignoring the context. For example, some thought "breathing space" meant "space in the mouth." Other errors she classified as a result of "meaningless associations," "inadequate expressions" or "gross misunderstandings."

On the basis of Looby's findings, in addition to those of Groesbeck (1961), Horne (1966), Burt (1971), it would appear that the

familiarity of the vocabulary would have a great bearing in the successful interpretation of similes. Unless the author and the reader have similar associations for the key words, communication could be hampered.

However, this is not to say that all the language used in a simile should be familiar to the reader. A discreet amount of novel vocabulary in the simile setting may contribute to the child's language development. It would seem according to some non-research literature that simile as an element of figurative language may have been such a determining factor in the trends of the language development of mankind.

"Every word was once a poem. Each began as a picture. Our language is made up of terms that were all originally figures of speech" (Funk, 1950, p. 1). "Mankind never employed as many figures of speech, as when he had hardly any words for expressing their meaning" (Blair, cited by Barfield, 1927, p. 72). As Watts (1944, p. 196) expresses it,

Those who have studied closely the languages of primitive peoples are inclined to the view that metaphor was first employed in the way we have suggested, i.e. to describe the otherwise indescribable in terms of something familiar which it may be taken to resemble.

It is a common-place to students of semantic change that a language extends its range by using words in transferred senses, linking what is new in men's environment, and in their thinking, to words already available in the language, using them in a way at first figurative but in course of time becoming well established as the usual way of referring to something, so that the usage is then thought of as merely literal (Nowottny, 1962, p. 52).

Simile may have a parallel role in the language development of the child if authors link new ideas to ones with which the child is already familiar. If this is so, the present writer expects to find uncommon subjects linked with familiar vehicles and vice versa, or familiar subjects and vehicles linked in such a way so as to present a new and interesting perspective of the familiar. One, however, would expect communication to disintegrate if the child is presented with an unfamiliar relationship between two unfamiliar objects. The recognition of printed symbols should stimulate "the recall of meanings built up through past experience, and the construction of new meanings through manipulation of concepts already possessed by the reader" (Tinker, 1952, p. 11).

In this study an assessment will be made (by answering research question eight) of the extent of uncommon vocabulary in the similes.

Also Looby's findings indicate the importance of strong context for figurative language. One would expect this to mean that the simile sentence and the sentences around it are closely linked both by ideas and vocabulary. In his study, Hollingsed (1958) also notes that literal misinterpretations were as common as non-literal misinterpretations. It would seem that when the context of a simile is not strong there is a greater tendency for the reader to interpret the figure as an isolated fragment rather than as a part of the whole passage, thus possibly resulting in a literal interpretation. Unfamiliarity of vocabulary may compound this latter difficulty. In this study a count will be taken of contextual clues to the meanings of uncommon words

embellish a thought. Holder-Barell (1959, p. 18) asserts that a simile often expresses a fact much better and clearer than a mere statement could do. "And often we recognize the real function of an image when we try to express the same thing without using any metaphorical language." Foakes (1958, p. 9) discusses various characteristics of simile in its ability to emotionally intensify the basic idea; direct by limiting, enlarging or recreating meaning; and compress language.

Burton (1960, p. 90) would add that simile can be effective in providing colour and imagery to a passage; it may also be used to express a complex idea in few words.

Carpenter (1967, p. xv) suggests that metaphor gives "truth that aspect of beauty and that touch of emotion which convey to the mind the subtler implications of thought." Metaphors also can be used to define abstractions (Philbrick, 1942, p. 51).

Foakes (1952, p. 32) describes two types of metaphor each with its individual effect. The power of the intellectual

metaphor lies in the novelty of the relationships established and the imaginative vigour with which these are made. . . . It startles us into a new awareness of the relationship involved The reader is asked . . . to share in a rapid mental action.

The sensuous image on the other hand, "seeks to recreate in the reader feelings associated . . . with the mental picture suggested . . . and its immediate appeal lies often in a word-picture which we are asked to contemplate."

The above roles of similes and metaphors seem to be filled in

used in the similes. The assumption is that these units of information would tend to strengthen the context and thus aid appropriate interpretation.

Sentence structure. Simmons, whose unpublished field study is reported by Hollingsed (1958, p. 8), speculated that complexities other than unfamiliar vocabulary were involved in the interpretation of metaphors by sixth grade pupils. Despite the fact that the vocabulary used was familiar to the children, many errors still occurred. He concluded these may be due to the involved sentence structures surrounding the figurative expression.

During the preliminary study on similes from Newbery Awardwinners, the writer noted a particular phenomenon of sentence structure
that might complicate simile reading. Frequently the subject of a
simile was represented by a pronoun, the antecedent of which was often
remote. This study will attempt to determine how frequently a pronoun
stands for the subject of a simile and how far removed the antecedent
subject is by answering research question nine.

Functional Description of Similes

Critics of English literature have suggested a variety of functions that simile fulfils as authors use it in expressing themselves to the adult reader. Scheffler (1960, p. 48) succinctly states that metaphor serves to organize reflection and explanation. The same could be said of simile. Spurgeon (1935, p. 5) suggests that metaphor and simile may be used by a writer to illustrate, illuminate and

their immediate context. Literary critics note, however, that some expressions perform a very basic function in the context of a whole book.

It often happens that an author will rely on similes and metaphors to formulate the main themes of his novel with the maximum of precision, concreteness and expressive force. Imagery may, therefore, take the critic by a straight route to the very core of the work of art, and the metaphors arising around these central themes may develop into major symbols (Ullmann, 1957, p. vii).

Dr. Wood's opinion (cited by Carpenter, 1967, p. 171) confirms that of Ullmann "that strong figures are the cornerstone of style, but especially of English style."

Holder-Barell (1959, p. 10) warns against tearing "the images out of the respective situations . . . " when actually each must be interpreted "out of its context because its full significance can only be recognized if it is seen as part of an organic growth." He states that in prose "images are rooted fast in the plot, and form a highly organic part of it, with the exception of those which are merely introduced for decorative purposes." He discusses five types of images. The rhetorical image produces an effect on the whole like some "background accompaniment" (p. 17). The expanding image emphasizes important facts and illustrates certain statements. Certain qualities of individuals in the story are emphasized by characterizing images. The abstract is often expressed in terms of the concrete through another type of image. The constructive image may "emphasize important stages in the development of a person or an action . . . or it may foreshadow events that will happen at later points in the novel"

(p. ~117).

If these observations could be applied to children's literature, it would seem that while many similes may have a specific function within a limited context, other similes may have particular significance in the development of an entire book. To the writer's knowledge, no researcher has investigated and classified similes in children's literature according to their functions in the book.

In this study all of the similes of a single book were examined within the context of the complete book in an attempt to see the full significance of each "as part of an organic growth" to borrow Holder-Barell's words. The writer sought to structure this informal analysis stated as research question ten in the light of some of the suggestions about the functions of similes considered above.

Summary

In the third and final section of this chapter the particular basis for each of the ten research questions was presented. It was noted that simile was fundamental to our language. It occurred often in other types of material written for children and thus was to be expected in children's fiction. The background for each question pertaining to the quantitative, qualitative and functional description of similes in children's fiction was discussed.

CHAPTER III

IDENTIFICATION OF FICTION

A major concern of the researcher was the identification of fiction considered suitable for children in grades four, five and six and commonly recommended for elementary school libraries in Canada. This concern was expressed in the first research question of the study and this chapter was written in an attempt to answer that question.

In Chapter II, reasons were given for choosing fiction as the source from which similes were to be selected and described for the purposes of this study. The objective of this chapter is two-fold. First related, is the procedure by, which fiction was eventually identified; secondly, the list of titles of fiction thus identified is presented.

PROCEDURE FOR IDENTIFICATION OF FICTION

In the absence of firm data about what fiction Canadian upper elementary school children do in fact read, the researcher attempted to identify fiction commonly recommended for these children. To do this, two staff members of the School of Library Science at the University of Alberta were consulted. Because these professors are involved in the training of librarians for schools, their advice regarding how to recognize such fiction was of particular value.

9. Notable Children's Books. Published 1940-1959.

Chicago: American Library Association, 1966.

Description of the Book Lists

To facilitate comparison, a brief description of each of the nine lists is presented in Table 3.

Several points seem noteworthy. Both Canadian lists were published in eastern Canada. It can only be assumed that school librarians in western Canada also use these lists. Four of the seven American lists were published by the American Library Association. This may indicate that the same preferences for books are reflected in several lists.

Selection of titles for the lists was usually done by a committee of school librarians and other specialists. In one case parents were included. For three lists, however, the titles were compiled by an individual and thereby more possibility of bias exists.

Five of the nine lists claimed to have a purpose of either guiding in initial book purchase for an elementary library or of presenting a basic list of titles. Thus these lists indicated that the titles they contained were essentially fundamental in a school library, and may represent a more limited selection.

The most common criteria for book selection seemed to include proven usefulness, popularity with children, mention in book reviews or other selection aids, authenticity of subject matter, and literary quality.

TABLE 3
SURPHARY DESCRIPTION OF BOOK LISTS

List	Publisher	Selected or Compiled by	Stated Purpose	Stated Criteria for Book Selection	Stated scope of book selection
1	C.S.L.A. Ottawa	Committee of the Canadian School Library Assoc.	Guide for initial purchase for ele- mentary school	Books which have been proven essential	
2	Ryerson Press, Toronto	•	Basic list of books for children's public libraries in Toronto	Enduring quality and those which children will accept and read	Books published in U.S.A. Canada Great Britain
3	Bowker, New York	J. Stragow (Librarian)	-	Popularity with readers, written published reviews, timeliness of subject	-
4	A.L.A. Chicago	E. Hodges (Librarian)	Foundation for first year school library or for additions	Quality, subject matter, appeal to imagination, men- tion in selection sids	Retrospectica and recent
5	A.L.A. Chicago	Specialists experi- enced with children and children's books	Irreducible minimum	Quality, contribu- tion to wisdom, merriment or appreciation of . beauty	Older and recently written
6	Wilson, New York	Representative group of librarians and specialists in chil- dren's fiction	Aid in purchasing cataloguing, refer- ence, maintenance, training librarians	Demonstrated use- fulness in school and children's libraries	In print books
7	Bro-Dart Fdn., Newark	School librarians and members of the A.L.A. Advisory Committee	Minimum collection of titles for an established ele- mentary school library	Literary quality, appeal to children, authenticity, for range of reading abilities	High quality materials on all topics
8	A.L.A. Chicago	Parents, teachers and the Children's Services Division A.L.A.	Suitable for family enjoyment and purchase	Suitable for family purchase and enjoyment	-
9.	A.L.A. Chicago	Children's Services Division, A.L.A.	Notable books published between 1940 and 1959	Creativity, clarity, excellence, appropriateness, acceptance by children	Books published between 1940-1959

They recommended nine lists of books that in their professional judgment are used commonly for book selection in Canadian elementary school libraries. While seven of the lists were published in the United States, two were published in Canada. The names of the nine lists follow in alphabetical order except that the two Canadian lists precede the American lists. The number in front of the name of each list is the number that represents that list in Tables 3, 4 and 6.

non-fiction or not suitable for children in the intermediate grades on another list. However this rarely happened.

Table 4 specifies which of the nine book lists provides information about books as fiction and as suitable for children in the intermediate grades and which lists do not.

TABLE 4
LISTS CLASSIFYING FICTION FOR
INTERMEDIATE GRADE CHILDREN

Books were:				Воо	k L	ist	s		
	1	2	3	4	5	6	7	8	9
Classified as fiction	x				x	ж	x		<u> </u>
Not classified as fiction		x	x	x				x	x
Classified as suitable for Grades 4, 5, 6 or ages nine, ten and eleven	x		×	x	x	x	x	x	
Not classified as suitable for Grades 4, 5, 6 or ages nine, ten and eleven		x							ж

From this table it may be noted that on only four of the nine lists were books classified as fiction. On seven of the lists books were classified as suitable for children in intermediate grades. For all titles on book lists two and nine whether or not they were fiction and suitable for children in the intermediate grades was established by consulting another list.

Titles had to occur on at least three of the nine lists or on both Canadian lists meeting the first two criteria in order to qualify

The type of information provided as to the scope of book selection varied widely. In most cases it was difficult to deduce how wide was the range of dates and places of publication of books included in a list.

Selection of Books

The researcher was primarily concerned with three criteria when selecting titles from the nine lists. To be included in the compiled list presented in Table 6, a title had to be considered to be:

- 1. Fiction,
- 2. Suitable for children in the intermediate grades,
- 3. Commonly recommended.

The researcher considered a book title on a particular book list to be fiction if the compiler of that list classified it as fiction. If the compiler of the list classified a book as non-fiction it was not considered to be fiction on that list irrespective of how the compilers of other lists classified the book. Where the compiler of a list did not provide information as to whether or not he considered a book to be fiction the researcher consulted other lists in which this information was provided. If the title was considered to be fiction on any one of the other nine lists it was considered to be fiction on the list in question also.

Established in identical manner was the suitability of each title on each book list for children in the intermediate grades. It was possible for a title to be classified as fiction suitable for children in the intermediate grades on one list and classified as

for the third criterion--that of common recommendation.

In Table 6 in the next section an "x" under the number of a book list indicates each list on which such a qualifying title occurred. A total of 562 titles were thus compiled.

Categorization of Books

The researcher surveyed this compilation to establish on which lists (American or Canadian) the titles occurred. Each title was classified in one of four categories in an attempt to emphasize the source of its recommendation and to establish the proportion of titles favoured by Canadian lists, those heavily favoured by American lists, and those favoured by both Canadian and American lists.

Compilers of American book lists and compilers of Canadian book lists seem to have their respective biases. For example, while the Canadian classic Anne of Green Gables appears on both Canadian book lists it appears on none of the American book lists. However, those involved in book selection for Canadian school libraries apparently do use American book lists quite extensively.

Canadian lists but less than six American lists. Category B included titles on at least six American lists but less than two Canadian lists. Those titles on two Canadian lists and at least six American lists were included in Category C. All the remaining books were classified as Category D as not particularly favoured by either American or Canadian lists. The description of these categories is summarized in Table 5.

TABLE 5
CATEGORIZATION OF BOOKS

Category	Book	s On:
	Canadian Lists	American Lists
A	2	Less than 6
В	Less than 2	6 or more
C	2	6 or more
D	Less than 2	Less than 6

In Table 6 the category of each book is denoted on the above basis.

LIST OF FICTION

Already related in this chapter was the procedure by which fiction was selected and classified. The resulting compilation of 562 titles is presented in Table 6.

CHAPTER IV

PROCEDURE OF THE STUDY FOLLOWING IDENTIFICATION OF FICTION

Described in this chapter is the sample of books selected from the fiction identified in Chapter III. Also the process by which similes were identified in these books is recorded. Finally reported is the procedure by which research questions two to nine were applied to the similes.

THE SAMPLE OF BOOKS

From the total population of 562 titles listed in Table 6 a stratified random sample of twenty books was drawn as described later in this section. Because all of the similes in the book sample were to be surveyed, it was felt that twenty books was the largest manageable size of sample.

In Table 7 the titles of these 20 books, selected from the total of 562, are listed alphabetically. The author's name and the date of the first publication of the book is shown next, followed by the number of pages of text in the book.

The dates of the books range from as early as 1881 to 1969.

Between <u>Heidi</u> in 1881 and <u>The House at Pooh Corner</u>, 47 years elapsed.

While <u>Thirteen Ghostly Yarns</u> was published in 1942, some of the tales compiled in it by Elizabeth Sechrist, such as the selection from Shakespeare's <u>Hamlet</u>, are very much older. <u>A Pony Called Lightning</u>

TABLE 7
SAMPLE OF TWENTY BOOKS ALPHABETIZED

Title	Author	Date	Number of Pages
Amahl and the Night Visitors	Frances Frost	1952	82
	Frances Frost	1932	02
The Bears on Hemlock Mountain	Alice Dalgliesh	1952	58

The Return of the Twelves	Pauline Clarke	1962	239
Thirteen Ghostly Yarns	Editor, Elizabeth Sechrist	1942	197
The Ugly Duckling	Translator, Lilian Moore	1969	42

was published in the late 1940's. Of the remaining sixteen books in the sample, eleven were published between 1950 and 1959, and five were published during the 1960's. However, Lilian Moore's <u>The Ugly Duckling</u> is a new English version of an old tale by Hans Christian Anderson. There is no firm data to indicate that Canadian school children are reading only books published in a particular period of time. So a sample of books published over eighty-eight years may include some attending variations of similes that children still read.

Books in the sample vary in length from 42 to 320 pages of printed text with the average being 155 pages. The length of a book may affect the similes included. Books of varying length are found on the library shelf and this fact is reflected in the sample.

The backgrounds of the stories vary. Amahl and the Night

Visitors is Frost's narrative adaptation of Menotti's opera.

Lamorisse's The Red Balloon is a translation from the French movie

"Le Ballon Rouge." Books such as The House at Pooh Corner, Impunity

Jane, Little Witch, Half Magic, The Return of the Twelves are

fanciful.

The settings of the books are diverse ethnically, historically and geographically. Amahl and the Night Visitors concerns imaginary happenings in Palestine at the time of Christ's birth. Through The Bushbabies, the reader is exposed to many aspects of life in Kenya. The Eagle of the Ninth carries the reader back to old England under Roman legions. In Heidi one becomes acquainted with Switzerland as one becomes acquainted with China in Little Pear and the Rabbits.

Paris impresses the reader through <u>The Red Balloon</u> while the pathetic condition of beggar children in war-torn Italy grips the reader in <u>The Little Fishes</u>. <u>Eagle Feather</u> and <u>Nkwala</u> tell of North American Indian boys. The problems of growing up in a modern inner-city are poignantly portrayed in <u>Ellen</u> and the <u>Gang</u>.

This diversity in the settings and backgrounds of the books in the sample lends it strength as a cross section of the diversity found in fiction for children. Reading problems may arise for the reader as he adjusts vicariously to the environment of each story and the attending variations in the similes it presents to him.

The sample of twenty books was drawn randomly using a table of random numbers (Wallis and Roberts, 1963, p. 632) reading down the last three digits of the columns beginning at column sixteen. However, the sample was stratified to maintain the same proportions of the books of Categories A, B, C, and D as were found in the total population. This was an attempt to keep the sample as representative of the total population as possible. As can be seen in Table 8, three quarters of the books occurred in Category D indicating they were not particularly favoured either on American or Canadian lists. Because each book in the total population was considered equal with each other book, it seemed that the large number of books considered Category D necessarily had to be reflected in the sample. Thus fifteen of the twenty books of the sample came from Category D. Three of the twenty books were those particularly preferred on the Canadian lists (Category A). One book was particularly preferred on American lists (Category B), and one book was heavily favoured on both American and

Canadian lists (Category C).

TABLE 8

PROPORTIONS OF BOOKS IN POPULATION AND SAMPLE

	A	В	Categories C	D	Total
Number of titles in total population	79	25	23	435	562
Proportion of twenty books	2.81	0.89	0.85	15.51	20
Number of books in random sample	3	1	1	15	20

In Table 9, the twenty books are rearranged in order of the category in which they belonged and then by the year in which they were published.

Heidi, the earliest book published in this sample, was the book selected in Category C indicating its very high recommendation on Canadian and American lists. The books particularly recommended by Canadian lists spanned nearly forty years of publishing from 1928 to 1965. The book representing the category of books particularly recommended by American lists was published in 1954. The remaining books dated from 1942 to 1969, half of the books being published in the 1950's.

The books representing Categories A, B, and C (indicating high recommendation) varied in length from 178 to 320 pages with <u>Heidi</u> being the longest. Only a third of the books in Category D had over 178

pages. This indicates that the most highly recommended books in this sample tend to be longer than average length.

IDENTIFICATION OF SIMILES IN THE BOOKS

In each of these twenty books the researcher circled and numbered in the margin each word "as" and "like" as they occurred in the text with the following exceptions:

- 1. In a negative setting, i.e. "not like" or "not as."
- 2. "Like" used as a verb, or meaning "for example,"
- 3. "As" meaning "for," "such as," "same as," "concerning," "which," "when," "while," "because," "what," "as well as," "as soon as," "as long as." "as far as."

According to the researcher's definition of "simile," it must necessarily contain the linking word "as" or "like." Thus each circled link was considered a simile possibility. (Many of these "simile possibilities" were extremely remote possibilities as many kinds of non-simile expressions were included. Thus, it was anticipated that in the identification of similes, a large proportion of these "possibilities" would be discarded). The researcher identified each of the 1458 simile possibilities as simile or non-simile using the definition stated in Chapter I. Two other judges, each an experienced elementary school teacher doing work in reading at the graduate level, worked independently through the same process. Of the 1458 simile possibilities, 769 were agreed upon unanimously as being similes and these became the total population of similes. The judges found that

TABLE 9
SAMPLE OF TWENTY BOOKS BY CATEGORIES AND DATES

Category	Title	Date	Pages
A	The House at Pooh Corner	1928	178
A	Gone-Away Lake	1957	180
A	The Bushbabies	1965	278
В	Half Magic	1954	215
С	Heidi	1881	320
D	Thirteen Ghostly Yarns	1942	197
D	A Pony Called Lightning	1948	137
D	Amahl and the Night Visitors	1952	82
D	The Bears on Hemlock Mountain	1952	58
D	Eagle Feather	1953	88
D	Little Witch	1953	116
D	The Eagle of the Ninth	1954	255
D	Impunity Jane	1955	42
D	Little Pear and the Rabbits	1956	113
D	The Red Balloon	1956	43
D	Nkwala	1958	119
D	The Return of the Twelves	1962	239
D	Ellen and the Gang	1963	183
D	The Little Fishes	1967	215
ם	The Ugly Duckling	1969	42

most of the discarded simile possibilities were comparisons of two things not sufficiently dissimilar. For example, in A Pony Called Lightning (Mason, 1948, p. 89), one horse says to another horse, "When you are big like I am, you can eat real corn." This was not considered to be a simile, which is an expression of similarity between the dissimilars, but a comparison of similar creatures different in size. The inter-judge reliability was calculated according to the Arrington formula (1932, cited by Feifel and Lorge, 1950, p. 5). The formula is

2 x agreements

2 x agreements

The percentages of agreement between the three judges was as follows:

TABLE 10
PERCENTAGES OF AGREEMENT BETWEEN JUDGES

Independent Judges	Percentage of Agreement
1* + 2	93.06%
1 + 3	91.72%
2 + 3	89.66%

^{*}Judge 1 was the researcher.

Other studies using this formula were examined to determine acceptable percentages of agreement. On the basis of such studies (Feifel and Lorge, 1950; Voice, 1968; Burt, 1971), it seemed that the percentages of agreement shown in Table 10 may be considered acceptable for the purposes of this study.

pages in the book. To find the density of similes per thousand words, a one thousand word sample was taken from the beginning of each fifth of a book. It was thought that these divisions were sufficiently small to reflect simile density through the book. The number of similes in these five samples was counted and then divided by five to arrive at the average density of similes per one thousand words. Books were classified as older or recent according to the following definitions:

- 1. "Older" books were those published in or prior to 1954.

 These books would have been published at least five years prior to the birth of a child who became eleven years old in 1970 and thus contain ideas possibly current before the life time of a child in an intermediate grade today.
- 2. "Recent" books were those published in or following 1955. These books would have been published less than five years before the birth or within the life time of a child who became eleven years old in 1970 and so probably contain ideas relevant during the life span of a child now in an intermediate grade.

"Are similes evenly distributed throughout a book?" was the fourth question posed by the writer of this study. By knowing the precise location of each simile in the twenty books (see Appendix A) the writer was able to calculate for each book how many similes occurred in each fifth, how often more than one simile occurred on a page, and how often similes occurred in clusters. A simile cluster was defined as at least two similes in which the link of one simile is not more than three lines distant from the link of the succeeding

The location of each of the 769 similes by the page and line of the book in which it occurs is listed in Appendix A.

DATA COLLECTION AND ANALYSIS

A major concern of Chapter II was the explanation of the rationale behind the posing of each research question. Thus this section deals not with "why" each question was asked, but "how" the answers were obtained.

The First Question

In Chapter III the procedure was related for identifying fiction considered suitable for children in the intermediate grades that is commonly recommended on lists used for book selection in Canadian elementary school libraries. In this chapter there will be no further discussion of question one.

The Second, Third and Fourth Questions

These questions dealt with the similes in each of the twenty books in a quantitative way. Question two, "How many similes occur in a book?" was answered for each book by a count of the expressions considered to be similes by the unanimous opinion of the three judges.

The third question asked whether or not similes occurred as often in recent books as they did in older books when the density of similes per page and per thousand words was considered. Finding the density of similes per page involved simple averaging calculations for each book using the total number of similes and the total number of

simile in the text in which they occur.

The Fifth, Sixth, Seventh, Eighth, and Ninth Questions

These questions dealt with similes in a qualitative way. Each of the 769 similes in the twenty books was assigned a number. Fifty of the similes were selected by using a table of random numbers (Wallis and Roberts, 1963) entering at row 113, columns three, four and five and reading down the columns. It seemed to the writer that fifty similes was the maximum manageable number for a more detailed description. These similes are quoted in their immediate contexts in Appendix B.

Shown in Table 11 is the number of similes from each of the twenty books selected in the random sample of fifty for qualitative description. The sample of fifty similes seemed quite representative numerically of the total population of 769 similes. Any book containing more than eleven similes is represented in the sample. To maintain the same proportion of similes in the sample population that they had in the total population, <u>Bushbabies</u>, <u>The Eagle of the Ninth</u> and <u>Gone-Away Lake</u> would need to total twenty-nine similes in the sample population. They total slightly more than this with thirty-three similes. Similes from twelve of the twenty books were included.

Each of research questions five to nine was applied to each of the fifty similes drawn in the random sample. Question five reads, "In what patterns do the elements of similes occur?" Each simile was analyzed for its arrangement of subject, vehicle, link and commonalities and the pattern noted by the initial of the element.

TABLE 11
DISTRIBUTION OF SIMILES IN POPULATION AND SAMPLE

Totals	769	50

For the simile, "The archaeologist craned forward like an ostrich" (Stevenson, 1965, p. 11), the pattern of elements was diagrammed as SCLV. Some patterns were found to be simple and some complex. The simile above is an example of a simile following a simple pattern as it has a single subject, commonality, link and vehicle. A simile with two vehicles, for example, was considered to follow a complex pattern. Patterns of elements are explained in greater detail in Chapter V.

The writer queried in question six how often the commonalities of subject and vehicle were stated in the simile and/or implied in the context of the simile. For each of the fifty similes the writer, on the basis of her own judgment, noted commonalities that were stated in the simile itself and/or implied within one page preceding and one page following the simile.

To answer question seven, "What are the subjects and vehicles of similes?" the subjects and vehicles were all classified according to the categories in Figure 12. The decisions of classification were based on the joint opinion of the researcher and another elementary school teacher involved in graduate research in the field of reading.

All subjects and all vehicles

Concrete

Non-Concrete

Person Animal Object

Abstract Action Other

FIGURE 12

CLASSIFICATION OF SUBJECTS AND VEHICLES OF SIMILES

"Concrete" subjects and vehicles are those which take up space as a solid, a liquid or a gas. They were categorized as:

- "Person" if the term applied to humans, a human or part of a human,
- "Animal" if the term applied to members, a member or part of a member of the animal kingdom other than human,
- 3. "Object" if the term applied to any other concrete item other than person or animal.

"Non-concrete" subjects and vehicles are those which do not take up space as a solid, a liquid, or a gas. They are categorized as:

- 1. "Action" if the term applied to some movement or a condition of being moved (it is only immediately available to the five senses in that something concrete is involved in the movement),
- 2. "Abstraction" if the term applied to a quality, condition or idea not immediately available to any of the five senses,
- 3. "Other" if the term applied to any non-concrete concept which was not action or abstraction.

"How often does vocabulary uncommon in children's reading material occur in similes, and are clues to the meanings of uncommon words provided in the context?" was question eight. To answer this question each word in each of the fifty similes of the random sample was checked against Thorndike and Lorge's The Teacher's Word Book of 30,000 Words. All words which had a score of less than ten in the General column or less than sixty in the Juvenile column were listed as uncommon. According to Lorge and Thorndike these words would not

the fifty similes that were represented by pronouns. Where this occurred the number of words between the pronoun and its antecedent was noted.

The Tenth Question

"What functions do similes seem to perform in a book and what proportion of the total similes in a book perform each function?" was question ten. The researcher selected The Little Fishes for this informal analysis because it seemed that to a large extent this author had depended on figures of speech in developing the story. It may indeed be rare for figures of speech to function so crucially in the development of a story; but the researcher chose The Little Fishes to demonstrate that this situation was possible. For the child reading this book, it would seem particularly critical that he have some ability to interpret similes.

SUMMARY

Described in this chapter was the sample of twenty books drawn from the total population of 562 titles of fiction. The twenty books varied widely in date of publication, number of pages, background and the setting of the story. The sample was randomly stratified. This was to keep the sample representative of the proportions of the total population of books that were particularly favoured on Canadian lists, on American lists, on Canadian and American lists, on neither Canadian nor American lists.

Next related was the manner in which all the similes in the

occur in the reading material of children in intermediate grades frequently enough for them to be definitely familiar (Thorndike and Lorge, 1959, p. x).

Any clue to the meaning of an uncommon word provided in the context (the page preceding and the page following the simile) was noted. Specifically these clues included examples, synonyms, explanations and related words. An example of the latter type is the word "church" found in the context of the unfamiliar word "spire."

The writer found that the list by Thorndike and Lorge had its limitations. It was first compiled in the early part of this century and it seems no major revisions have been made since the 1940's. Because the English language is never static, the familiarity of children with particular words must vary constantly. For example, such words as "zebra," "swimmer," "web" and "violin" probably would occur frequently in modern fiction and would be in the reading vocabulary of the majority of children in the intermediate grades today. Certain words may have become less familiar to children due to their occurring less frequently in printed material for the child reader. Since the completion of the present study a more up-to-date vocabulary list has been published. Now available is The American Heritage Word Frequency Book (1972) edited by Davies, Richman and Carroll.

Question nine read, "How often is the subject of a simile represented by a pronoun and how many words separate the pronoun from its subject antecedent?" A simple count was taken of the subjects of

twenty books were identified. Three judges read all the simile possibilities. Only those which were similes in the unanimous opinion of the three judges, working independently, were considered to be similes.

The third section of the chapter described how the research questions were applied to similes. The quantitative aspect included all 769 similes in the twenty books. Fifty similes randomly selected were qualitatively described. All the similes in a single book were used in the functional description.

CHAPTER V

THE DESCRIPTION OF SIMILES

In this chapter the findings of the study are reported as follows:

- 1. A quantitative description of the similes in the sample of twenty books to answer research questions two, three and four,
- 2. A qualitative description of the characteristics of fifty similes randomly selected from the twenty books in answer to questions five through nine,
- 3. A functional description of all the similes found in a single book to answer question ten.

QUANTITATIVE DESCRIPTION OF THE SIMILES

Each of the 769 similes in the sample of twenty books tabulated with its location by page and line as recorded in Appendix A provided the data for answers to research questions two, three and four.

Research Question Two

"How many similes occur in a book?" In Table 12 the titles of the twenty books are arranged alphabetically. Each title is followed by a number that was assigned to that book and which will represent that book in tables presented later. Following the publishing date is the total number of similes found within each book.

Thirteen Ghostly Yarns	19	1942		52	197	.265	1.0
The Ugly Duckling	20		1969	-	42	.024	0.3
Totals				769	3100	.248	1,1

The number of similes varied widely from 1 in <u>The Ugly Duckling</u> to 174 in <u>The Eagle of the Ninth</u>. Half of the books had fewer than a dozen similes while seven books had between seventeen and fifty-five similes. Three books contained over 100 similes each, together containing a total of 447 similes. With a total of 769 similes in the twenty books the average number of similes found in each book was 38.

It would seem that in reading some of these books a child would confront a considerable number of similes.

Research Question Three

"Do similes occur as often in recent books as compared to older books according to their density?" That is, are authors of the books in the sample tending to use simile more liberally or less so? In Table 12 following the number of similes and the number of pages, information on the density of similes in each book is presented. The average number of similes per page in the over-all calculation is 0.248 while the over-all density of similes per thousand words is 1.1. This means that a reader of this sample of books may expect on the average to encounter a simile nearly every four pages and at least once in one thousand words. This finding becomes more significant when one realizes that a single simile often involves many words and some similes involve whole paragraphs.

It may be noted from Table 12 that ten of the twenty books were considered older as they were published in or prior to 1954. Ten books were considered recent as they were published in or since 1955.

In Table 13 the least and the greatest density of similes for the ten older and the ten recent books is shown.

TABLE 13

RANGE OF SIMILE DENSITY IN BOOK SAMPLE

	Per	Page	Per Tho	ısand Words
	Least	Greatest	Least	Greatest
-1954 Older books	.011	.682	0.0	1.8
1955+ Recent books	.022	.609	0.0	3.2

It does not appear that there was much difference in the range of simile density found in these older books as compared to that found in the more recent books. While some authors of both the older and the recent books used simile to a considerable extent, the amount of simile used by other authors of either the older or the recent books was practically negligible. In some of the older books the density of similes was nearly thirty times the density of similes in other older books. This was also true of the more recently written books. The density of similes then in some of the books was far greater than the density of similes in other books whether they were recent or older.

However, a composite comparison between the ten older books and the ten recent books on the basis of the frequency of similes in either group produced some interesting results as indicated in

In each fifth of a book. Beside each book number in Table 15 appears the number of similes in each fifth and the percentage this is of all the similes in the book. From the totals at the bottom on the table it would appear that the section of the book in which the twenty authors used similes most frequently was the first section. Similes were used the least frequently in the central section. fifteen of the twenty books the smallest or nearly smallest proportion of the similes occurred in the middle section. However, this over-all pattern of distribution is suggestive only, rather than clearly indicative. Only forty-four similes are involved in the difference between the total numbers in the first sections and the central sections of the twenty books. While the over-all pattern of distribution noted above is reflected to some extent in the simile distribution of individual books, it does not seem to be a reliable predictor of these individual patterns. So a reader of one of these books must adjust to the fluctuation of simile distribution in that book.

On a page. The second part of question four dealt with whether or not more than one simile occurred on a page. From question three it was observed that a child could expect to encounter on the average one simile every three to five pages in his reading of this sample of fiction. However, from Table 16 it may be observed that these authors did not neatly deposit a single simile every third, fourth or fifth page. In this table information is presented for each book showing how many pages contained zero, one, two, three, four or five similes; what percentage this number was of the total number of pages in the

Table 14.

TABLE 14

FREQUENCY OF SIMILES IN BOOKS
OLDER AND RECENT

		Total	Average No.	of Similes
	Pages	Similes	Per Page	Per 1,000 Words
-1954 Older Books	1646	336	0.204	0.88
1955+ Recent books	1454	433	0.298	1.30

Although the older books totalled nearly two hundred pages more than the recent books they contained nearly one hundred similes fewer than the latter. Taking the total sample into consideration then, a reader would encounter one simile on approximately every five pages of one of the older books, and every three or four pages in one of the recently published books. The calculations for density of similes in a thousand words supports this finding. For the recent books simile density per thousand words was nearly twice as much as for the older books.

Research Question Four

"Are similes evenly distributed throughout a book?" This question was answered from three points of view, the first dealing with distribution of similes among the fifths of each book.

TABLE 15

book; how many similes were included on these pages; what percentage these similes represented of all the similes in the book. At the end of the table is the cumulative summary.

The greatest proportion of pages contained no similes. Surprising, however, is the finding that only a little over half of the 769 similes occurred as the only simile on a page. Nearly a third of the similes occurred on a page with one other simile. Instances of three similes on a page included 10 percent of all the similes. There were nine pages each of which contained four similes. On one page five similes appeared.

The three books that together contain well over half of the 769 similes would have the greatest bearing on this pattern noted in the cumulative distribution. In <u>The Bushbabies</u>, <u>The Eagle of the Ninth</u>, and <u>Gone-Away Lake</u> (book numbers three, five and seven respectively) only about 40 percent of the similes occurred as the only simile on a page although over half the pages of each book contained no similes.

In noting the "distribution by page" pattern of individual books, it became evident that the tendency for 60 percent of the similes to occur on pages with at least one other simile is not characteristic of the majority of books as it was with the three books mentioned above. In fourteen of the twenty books over half the similes occurred as the only simile on a page.

By way of summary, although most of these authors distributed similes fairly evenly throughout their books, often more than one

simile occurred on a page. It seemed that the authors who made greatest use of similes tended most often to place more than one simile on a page.

A child with limited simile-reading ability may be able to keep the thread of the story while encountering an occasional simile. However, for such a child a confrontation with several similes on a single page of a book may bring his reading comprehension of that book to a halt.

The final part of question four inquired as to whether or not similes sometimes occurred in clusters as defined in Chapter IV.

In clusters. As can be seen in Table 17 a total of 146 similes occurred in clusters. This figure represented 19 percent of the 769 similes in all twenty books. There were four incidences of three similes in a cluster. The remaining sixty-seven clusters each contained two similes. Authors varied in the frequency with which they formed simile clusters. While in Amahl and the Night Visitors all five similes were clustered, very limited use was made of simile clusters in Heidi and none in The Little Fishes. The books containing over fifty similes were fairly consistent with each other as to the proportion of their similes which occurred in clusters. Approximately one fifth of their similes were clustered.

For the child unable to understand similes well this may mean that frequently he is not disentangled from one simile when he encounters the next. The interpretation difficulties he had with the first simile may compound the difficulties he has with the second.

j

Summary

An average of thirty-eight similes per book was found; individual books contained between 1 and 174 similes. The reader of this sample of books would not necessarily encounter few or many similes merely because the book was older or more recent. However, when the over-all density of similes per page and per thousand words of the ten older books was compared to that of the ten recent books it was greater in the latter.

Authors did not always seem to distribute similes evenly throughout these books. They appeared to use similes most frequently at the beginning of a book and least frequently in the middle. While on nearly half of the pages more than one simile occurred, nearly a fifth of all the similes occurred in clusters on these pages.

QUALITATIVE DESCRIPTION OF THE SIMILES

Research Question Five

"In what patterns do the elements of similes occur?" The fifty similes were surveyed and in Table 25 (Appendix C) the pattern of the elements is recorded for each. Although it seemed the simile elements could occur in almost any sequence and in a variety of relationships, six distinct patterns of simile elements emerged. A summary of this aspect of the findings is presented in Table 18.

Simple patterns. Those similes that consisted of a series of single elements (one subject, one link, one vehicle and possibly a commonality) were considered to have a simple structure. For example,

TABLE 18 PATTERNS OF SIMILE ELEMENTS

Simple Patterns	A	B	С	D	II	III	Totals

							50 . 100%

[&]quot;S" refers to the subject of the simile.
"V" refers to the vehicle of the simile.
"C" refers to the commonality of subject and vehicle.
"L" refers to the link between subject and vehicle.
"1" refers to the primary term.
"2" refers to a secondary term.
"3" refers to a third term.
"a" refers to the element occurring first of plural elements.
"b" refers to the element occurring second of plural elements.

Simile 6, "The archaeologist craned forward like an ostrich,"

(Stevenson, 1965, p. 152) has a simple pattern of SCLV. From the fifty similes the researcher identified three different sequential patterns among the simple similes. In addition to the first pattern noted above and its variations there was a CSLV pattern and an LVCS pattern. Examples of these two simple patterns follow. Simile 7,

". . . herding her thoughts together like strayed sheep" (Stevenson, 1965, p. 159) is an example of a commonality—subject—link—vehicle sequence. In Simile 48, ". . . how like a tiny ape's was the bright—eyed, snubby face of Monkey" (Clarke, 1962, p. 129), a link—vehicle—commonality—subject sequence is followed. Table 18 demonstrates that thirty—nine of the fifty similes followed one of the three simple simile patterns. Thirty—four of these similes followed pattern I.

Complex patterns. Similes which did not consist of a series of single elements were considered to follow a complex pattern. There seemed two possible sources of complexity in simile patterns. While a simile has only one subject, it may have more than one vehicle and possibly more than one link. This situation is referred to as pattern VI in Table 18. "Va" refers to the first vehicle and "Vb" to the second. Only one of the fifty similes from the random sample followed this pattern. Simile 22 reads, "He called it up now, like golden water, like a trumpet call, the Light of Mithras" (Sutcliff, 1954, p. 179). A variation of pattern VI was noted in Nkwala (Sharp, 1958. p. 10) during the preliminary study. "Soft-footed as the lynx, sure-footed as the bighorn, he did not once slip." The pattern would be

recorded as CLV_aCLV_bS. Two vehicles each with a commonality and a link described one subject.

A second source of complexity in simile patterns was noted. The subject and vehicle of a simile sometimes seemed to occur in a kind of analogical relationship. This pattern was first noted during the preliminary study of the similes in My Side of the Mountain as in, "He [the weasel] sank beneath the leaves like a fish beneath the water" (George, 1959, p. 60). This does not seem to be a simple comparison of a weasel and a fish but rather a suggestion that "weasel" is to "leaves" as "fish" is to "water." Such a simile pattern is noted as $\frac{S_1}{S_2} = \frac{V_1}{V_2}$. Because the primary comparison seemed to be between "weasel" and "fish" these were referred to as S_1 and V_1 respectively. Considered to be secondary terms in the relationship were "leaves" and "water" denoted as S_2 and V_2 respectively.

This complex simile pattern is referred to in Table 18 as pattern IV. An example from this study was Simile 17:

$$\frac{\text{he [the Roman soldier]}(S_1)}{\text{came back to the present }(S_2)} \quad \text{like (L)} \quad \frac{\text{swimmer}}{\text{breaking surface }(V_2)}$$

Six of the fifty similes in the random sample followed this pattern either with or without commonalities.

Pattern V in Table 18 included two similes that seemed to suggest a third facet in an analogy type relationship. For example, Simile 33 followed this pattern:

Everywhere, tossing among the reeds, were little beaded cloths of web, and now and then they came on a larger kind, each wearing a dressy black-and-yellow spider and marked with a silky track as if the artist had signed his name (Enright, 1957, p. 168).

Both subject and vehicle seem to have three parts—if not stated at least implied. As the spider's silky track on a web, so is the artist's signature on his piece of art. This may be diagrammed as:

As may be noted from Table 18 a total of nine of the fifty similes followed complex patterns.

Combined patterns. A simile was considered to be of a combined pattern if it included the characteristics of more than one simile pattern. Two similes came in this category. They both had more than one vehicle, and subjects and vehicles were set in relationships. Simile 41 combined patterns IV and VI, "The poor are like the leaves in the storm or the twig in the river; plaything of forces which they do not control. .." (Haugaard, 1967, p. 161). It could be represented as $\frac{S_1}{[S_2]} \perp \frac{V_{a1}}{V_{a2}} = \frac{V_{b1}}{V_{b2}} C$.

Simile 34 is similar in pattern but somewhat more complicated as each of the relationships involves three aspects:

... they [the trees] were draped and festooned with matted honeysuckle vines, so that they looked less like trees than like great shawled figures, stooping, or like sinking vessels wrapped in their sails (Enright, 1957, p. 169).

Patterns V and VI are combined in this simile and so it may be

represented as:
$$\frac{\frac{S_1}{S_2}}{\frac{S_2}{[S_3]}} \stackrel{L}{=} \frac{\frac{V_{a1}}{[V_{a2}]}} \stackrel{L}{=} \frac{\frac{V_{b1}}{V_{b2}}}{\frac{V_{b2}}{V_{b3}}}$$

(stated commonalities: draped, festooned, shawled, wrapped)

Summarizing thus far, while it might be anticipated that at least the most common of these six patterns are typical of similes in these children's books, this may not be an exhaustive list of the variety of patterns in which the elements of similes could occur.

In examining the patterns of the similes in the sample as they occurred in each book only one book seemed to deviate from the norm.

(See Table 19). Excluding The Eagle of the Ninth, only 17 percent of the remaining similes in the sample have complex or combined patterns of elements. However, 36 percent of the fourteen similes in The Eagle of the Ninth have complex patterns of elements. This author tended to structure similes in more complicated patterns than did the others.

By way of summary, it was found that of the patterns of elements of the fifty similes 78 percent were simple, 18 percent were complex in pattern, and 4 percent were a combination of complex patterns. Assuming on the basis of the quantitative analysis that in these books a child would encounter four similes in four thousand words, he could expect three of these similes to be structured in a simple pattern and one to be more complicated either in a complex or a combined pattern.

TABLE 19

NUMBERS OF PATTERNS OF SIMILES IN SAMPLE OF BOOKS

Book		Pattern	of Element	ts
	Simple	Complex	Combined	Total
The Bushbabies	9	2	_	11
The Eagle of the Ninth	9	5	-	14
Ellen and the Gang	2	-	-	2
Gone-Away Lake	6	1	1	8
Heidi	2	-	-	2
Impunity Jane	1	-	-	1
The Little Fishes	2	-	1	3

A Pony Called Lightning	2	-	-	2
Return of the Twelves	2	-	-	2
Thirteen Ghostly Yarns	2	-	-	2
Totals	39	9	2	50

Some authors apparently used a greater proportion of similes of complex or combined patterns than did others. One would expect these books to be more difficult for children to read.

Research Question Six

"How often is the commonality of subject and vehicle stated by the author and/or implied in the context?"

It was found that in more than one way an author may indicate to the reader relevant commonalities of the subject and vehicle. Often they were stated within the simile. For example, in Simile 14, "He felt the Duty Centurion grow tense as a strung bow beside him" (Sutcliff, 1954, p. 25), the author pointed out that the Duty Centurion and the strung bow had in common a quality of tension. A commonality was thus stated. Referring back to Table 18, it may be noted that in thirty-three of the thirty-nine simple similes the commonality was stated; in seven of the eleven complex or combined patterns it was also stated.

Authors also frequently implied commonalities in the context—the page preceding and the page following the simile. Simile 26 reads, "She [the girl] was just like a wild animal" (Friedman, 1963, p. 103). In what way she was like a wild animal seemed to be implied in the sentence preceding and the sentence following the simile. "... she pushed her way out She knocked me over." It seemed that the author was suggesting commonalities such as desperation and violence. For twenty-six of the fifty similes commonalities were thus implied.

Decisions as to whether or not commonalities were stated in

the simile or implied in the context were made by the researcher, an admitted limitation. In Table 25 (Appendix C) each decision for the fifty similes was recorded and Table 20 presents this in summary.

TABLE 20

COMMONALITIES SUPPLIED BY THE AUTHOR
IN THE FIFTY SIMILES

	Stated in Simile and Implied in Context	Stated only in Simile	Implied only in Context	Neither Stated nor Implied in Context
No. of Similes	19	21	6	4
% of total	38	42	12	8

In only four of the fifty similes could the researcher find commonalities neither stated in the similes nor implied in the context, forcing the reader to depend solely on his own resources. In twenty-five of the fifty similes the reader would find the author has implied commonalities in the context. However, in four fifths of the similes the commonalities were stated directly, and were classified as "action" or "description" indicating that what the subject and vehicle had in common was some motion or some characteristic. These decisions also made by the researcher are recorded in Table 25 (Appendix C). For example, in Simile 6, "The archaeologist craned forward like an ostrich" (Stevenson, 1965, p. 152), the commonality "craned forward" was considered to be an action. In Simile 9 (Stevenson, 1965, p. 235)

where "the bloated carcasses of animals" are said to be "lifeless as upturned sofas," the commonality "lifeless" was considered to be "description." Of the forty stated commonalities twenty-one were considered to be "action" and nineteen to be "description."

In summary, it was found that in 92 percent of the similes of the random sample, the commonality of subject and vehicle was either stated in the simile or implied in the context. The authors of these similes thus seemed to be giving the child considerable assistance in interpreting the similes.

Research Question Seven

"What are the subjects and vehicles of similes?" Each subject and each vehicle of the fifty similes was classified as concrete ("person," "animal" or "object") or as non-concrete ("abstract," "action" or "other") as described in Chaper IV, and recorded in Table 26 (Appendix C).

Subjects and vehicles of similes in simple patterns. Table 21 summarizes the classification of the subjects and vehicles of the thirty-nine simple similes. In over two thirds of these similes both subject and vehicle were of a concrete nature. For example, Simile 1 (Stevenson, 1965, p. 10):

upcurling tails like whips

(concrete "animal") (concrete "object")

In thirteen cases the vehicle was "object" and the subject was either "animal" or "object."

Eight of the nine non-concrete vehicles were classified as "other," while only one of the subjects fitted this category. In referring back to the similes it was found that of these vehicles classified as non-concrete "other," three involved imaginary beings (gnomes, ghosts, and devils). The other five of these non-concrete "other" vehicles (shadows, for example) were accessible to at least one of the five senses.

Of the similes structured in simple patterns, five times as many subjects and vehicles were concrete as were non-concrete. The largest category was "object."

Subjects and vehicles of similes in complex and combined patterns. When classifying the subjects and vehicles in the concrete and non-concrete categories, each of the eleven similes following complex or combined patterns was unique (see Table 22). In three of the six similes following Pattern IV $\frac{S_1}{S_2}$ L $\frac{V_1}{V_2}$ the secondary terms of both subject and vehicle were non-concrete "action." For example, Simile 17 likens the soldier's coming back to the present to a swimmer's breaking surface (Sutcliff, 1954, p. 92).

Four of the six primary terms of subjects were concrete "person" (the swordsman, the Roman soldier, Murna, thirsty children), whereas four of the six primary vehicles were concrete "animal" (fly, lioness, kingfisher, hungry nestlings).

In the rest of the similes following complex or combined patterns the majority of elements were classified as "object."

As with most of the simple-patterned similes the only elements

each word of each simile was checked with The Teacher's Word Book of 30,000 Words (Thorndike and Lorge, 1959). Listed as uncommon (see Table 27 in Appendix C) were all words which according to Thorndike and Lorge would not occur with sufficient frequency in a child's reading material to be considered familiar. This procedure and the rationale behind the procedure were explained in Chapter IV as were the limitations of Thorndike and Lorge's list experienced by the researcher.

The page prior to and the page following each of the thirtythree similes as well as the simile itself, were scanned for clues to
the meaning of each "uncommon" word. "Clues to meaning" included
examples, explanations, synonyms and related words. For example, in
Simile 40, "It [New York] has many churches with great big spires . .
. . " (Haugaard, 1967, p. 140), "church" is considered to be a clue to
the meaning of the uncommon word "spires." Identification of "clues
to meaning" was made by the researcher. Each sentence containing such
a clue to the meaning of an uncommon word was considered to be a
"unit of information."

Beside each uncommon word in Table 27 (Appendix C) appears the number of "units of information" found in the context of that word. Words considered uncommon according to Thorndike and Lorge's list but occurring throughout a book as a major part of the story are followed by an asterisk in Table 27. There were three such words all of which occurred in the subjects of similes. These three words considered "uncommon" are supplied with ample information and so were excluded

classified as non-concrete "other" were found in the vehicles. Whereas in the simple-patterned similes, concrete elements numbered more than five times the number of non-concrete elements; the concrete elements of the more complicated similes numbered slightly more than twice the number of non-concrete elements in the same similes. In all of the fifty similes concrete elements numbered 103 while non-concrete elements numbered 28.

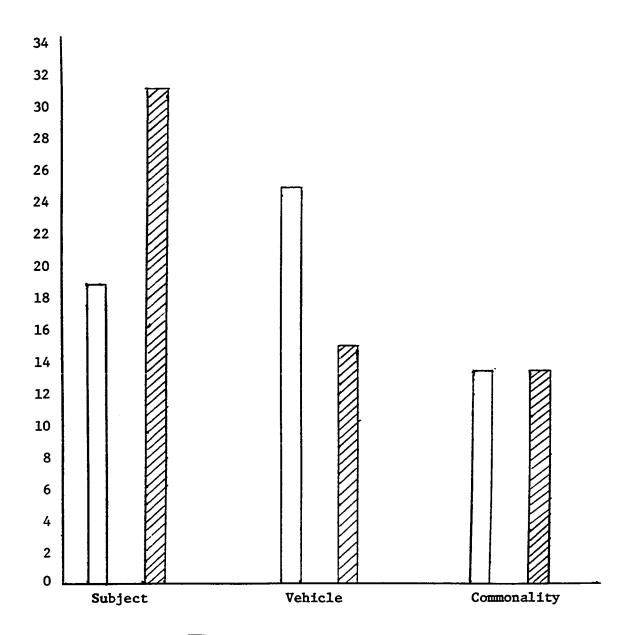

Shown below are the numbers of concrete and non-concrete elements in the three books from which most of the similes in the random sample were drawn:

	Concrete	Non-concrete
The Bushbabies	22	6
The Eagle of the Ninth	27	10
Gone-Away Lake	21	7

If the average ratio is slightly more than four concrete elements to one non-concrete element, the similes in The Bushbabies and Gone-Away Lake would fit this description. However, the similes in The Eagle of the Ninth seem to have rather a larger than average number of non-concrete elements. On this basis it may be that similes in this book could cause more difficulty for a child reader.

Research Question Eight

"How often does vocabulary considered uncommon in children's reading material occur in similes, and are clues to the meanings of uncommon words provided in the context?" Other than proper nouns,

= Number of uncommon words

= Number of units of information

FIGURE 13
UNCOMMON VOCABULARY AND UNITS
OF INFORMATION IN CONTEXT

from the graphic representation (Figure 13). "Bushbabies," for instance, was what Stevenson's story (1967) was all about.

It seemed that in these similes authors used slightly more uncommon vocabulary in vehicles than in subjects but gave considerably fewer clues to the meanings of these words. Fewer uncommon words were used in commonalities than in either subject or vehicle. These findings are presented graphically in Figure 13.

The child then is likely to encounter some uncommon words in these similes but for those occurring in the subjects and commonalities he would find in the context a considerable number of clues to their meanings. However, most of the uncommon words occurred in the vehicles of similes which authors imported to describe the subjects. For many of these words the child would find no clue to their meaning in the context. Thus the reading of these similes may be hampered by vocabulary difficulties.

In only one instance did uncommon words occur in both subject and vehicle with clues to their meanings provided for neither. The words "potent" and "talisman" found in Simile 21 from The Eagle of the Ninth (Sutcliff, 1954, p. 177) were both considered uncommon: "An odd, potent link across the years, and he held to it as to a talisman, as he set about freeing the Eagle from its staff." In similes such as this, key words were uncommon and clues to the meanings of these words were not apparent. This type of simile likely would have little meaning for the child reading it.

Research Question Nine

"How often is the subject of a simile represented by a pronoun and how many words separate the pronoun from its antecedent?"

In nineteen of the fifty similes a pronoun was used to represent the subject. These pronouns and their subject antecedents are listed in Table 28 in Appendix C. The number of words intervening between the pronoun and its subject antecedent varied between zero and ninetyeight. (See Table 23). The pronoun and its antecedent were separated by one or more phrases, clauses, sentences or even paragraphs.

TABLE 23
DISTANCE BETWEEN PRONOUN SUBJECT AND ANTECEDENT

Number of Similes	Words Intervening
2	0
6	6 - 10
9	14 - 31
2	Over 60

In some of these instances of pronoun usage, identifying the subject of the simile could be a problem for the reader. The value of such similes is questionable if the reader cannot be sure of that which the author is describing.

Other factors may add to this problem. For example, a pronoun stood for the subject in each of Similes 15, 16 and 17, all from The Eagle of the Ninth. However, each simile also occurred at the end of

questions similes were described in various ways within their immediate contexts, in this section the similes in a single book will be described in their total context of the entire book according to the role they seem to fill. While this description cannot be generalized to other situations as the classification of the similes was based solely on the subjective judgments of one person dealing with a single book, it may stimulate further research on a broader basis and of a more objective nature.

Each simile in <u>The Little Fishes</u> was classified according to its apparent function. The writer had placed the simile functions suggested by literary specialists in the following hierarchy:

- 1. Supports main topic,
- 2. Reinforces main theme,
- 3. Develops plot by anticipating or connecting action,
- 4. Explains or discovers new thought,
- 5. Elaborates style.

In the writer's opinion the progression from categories one to five corresponds to decreasing functional significance in the book. It was also found that some similes seemed to function in more than one capacity. However, the researcher decided to place each simile only in the highest category of the hierarchy in which it seemed to function. Thus those similes with a function high in the hierarchy are particularly important, not only because their function is significant, but because they may carry out one or more less significant functions as

a lengthy and grammatically complex sentence. In Simile 17, not only did nearly a hundred words separate the pronoun subject from its antecedent, but thirty-two additional words occurred between that pronoun and the rest of the simile. One would expect such complicated sentence structure to precipitate comprehension difficulties for the child reader.

Summary

From the fifty similes, six patterns of simile elements were identified. Thirty-nine of the similes followed simple patterns; eleven similes followed either a complex pattern or a combination of complex patterns. Authors frequently stated the commonalities of the subjects and vehicles within the simile or implied them in the context. In only four of the similes could the researcher find the commonalities neither stated nor implied. Approximately a fifth of the subjects and vehicles of simple similes were found to be non-concrete, while nearly half the subjects and vehicles of the more complex similes were non-concrete. More uncommon words occurred in the vehicles of the similes than in either subjects or commonalities but fewer clues to the meanings were provided. Some of the similes occurred in grammatically complex sentences and in nineteen of the fifty similes a pronoun represented the subject.

FUNCTIONAL DESCRIPTION OF THE SIMILES

Specialists in literature have suggested various functions that similes perform within a book and have categorized similes on the basis of these functions. While in the foregoing eight

well. From a functional point of view these are the most important similes for the reader to interpret. In Table 24 the writer has presented the number of similes and the percentage that is of the total number in The Little Fishes for each of the five categories.

TABLE 24
FUNCTIONS OF SIMILES IN THE LITTLE FISHES

Category of Function	Number of Similes	Percentage of total
Supports main topic	-	-
Reinforces main theme	3	9.4%
Develops plot	6	18.7%
Explains or discovers new thought	14	43.7%
Elaborates style	9	28.2%
Total	32	100.0%

It seemed that nearly half the similes in <u>The Little Fishes</u> were used by the author to explain or discover an important thought.

Approximately one quarter of the similes served an ornamental purpose.

The remaining quarter of the similes seemingly played key roles in developing the plot or reinforcing the main theme.

Supports Main Topic

The main topic of <u>The Little Fishes</u> was considered to be the homeless children in Italy during World War Two. While none of the

Then I remembered what my mother had said to me, when I finally had guessed that she was dying. "Guido, you must be strong. You are all alone. Be strong like iron . . . like he was. But be kind, too; or you will wear yourself and others out. Don't be so strong that you will become lonesome. Don't forget that your mother loved you. I didn't know that. You see, Guido, love and strength are the only things that matter: the only two things one needs."

As I walked across the square to find a place to hide, a place to sleep, I said her first words aloud to myself: "Guido, you must be strong. You are all alone" (pp. 48,49).

After having brought two other children out of Naples, fed them, and found a place for them to sleep (p. 113), Guido reflected on whether or not he had kept his mother's advice.

Had I been strong . . . duro . . . as she had wished me to be? Had I been kind? I saw her face as it had been when she had been well; and I understood for the first time that although she had been very gentle, she, too, had been duro like iron (pp. 114, 115).

The topic and the theme occasionally become interwoven as where Guido referred to himself as having strong fins (p. 196). On another occasion a ruthless thief analogizes on fishes and fisherman (p. 124). Guido observes how like the thief was the German officer.

He, too, had talked about fishes and compared human beings to them. He, too, had thought of himself as a fisherman, or at least as one of the big fish who ate the little ones. "They are strong men," I thought, "but they have no kindness and they wear themselves out, without ever having enjoyed the beauty of the strength, which is to protect the weak not to threaten them" (p. 125).

These figures if adequately interpreted by the reader may lead him to the author's main idea.

Develops Plot

On six occasions the author seemed to have used a simile to help him develop the plot of the story either by preparing the reader

for a change in the story action, or by connecting different segments of the story. The stage for some of Guido's begging experiences was first set by the author's explanation that "... begging is an art, for the heart of each human being is like a lock, to which you must find a key. The key is not only the words you speak, but the expression on your face as well" (p. 27). After three chapters in which the reader is exposed to the circumstances of beggar children in an Italian war-torn city, he learns of Guido's life prior to these happenings. The author integrated the two diverse situations in the following simile:

I wanted to make "Guido's story" short. My mother, my uncle and aunt, and the village of St. Marco do not belong to my tale. . . .

And yet they do. For a tale is like a spider's web, with all the fine threads close together at the center spreading out farther and farther, until only four or five threads, each attached to a different branch -- like poles -- hold the whole web in place (p. 45).

Chapters twelve, sixteen and seventeen each marked a bad turn of events for the three refugee children and each of these chapters opened with a significant simile that seemed to serve as a premonition. For example, while chapter eleven ended optimistically with the children coping amazingly well with their transient life, chapter twelve commenced as follows:

It is not true that the poor always protect their own, nor that there is honor among thieves. There are those who are poor and yet steal from the poor as hungry rats will eat their own children.

We still were far from the city of Caserta when we first noticed the man following us (p. 117).

The sensitive reader is immediately aware of impending danger.

The final simile that seems to facilitate the plot occurred in chapter nineteen where the suffering of war survivors began to come to a climax. For two pages Haugaard had an important character remonstrate with himself for not having noticed the unwritten and unspoken words in the speeches of Mussolini.

Remember, the speeches of Mussolini, I have heard him speak in Rome and I shouted with the crowd. I only thought of what he said, not of what he hadn't said. He spoke of Italian glory; he did not speak of death and starvation; he did not speak of cruelty; he did not speak of the blood of innocent people (p. 186).

Surrounded by the death, starvation, cruelty and bloodshed of war he says, "The unspoken word blares like a trumpet now! . . . It blares like a trumpet" (p. 188). The desperation of the situation is emphasized in this simile, which also seems to suggest that things will become even more desperate.

Explains or Discovers New Thought

Of the thirty-two similes in <u>The Little Fishes</u> fourteen seemed to operate in this capacity. Brown (1971) described this type of figure as providing "a way of knowing, of crystallizing new relationships" (p. 69). Leondar (1968, p. 120) referred to these figures as radical in terms of "invention" and "discovery." While these similes did not seem to contribute directly to the main topic, theme or plot, they held more than a merely ornamental value. The thoughts these similes carried seem to contribute to the total impact of the book. They are integral rather than optional (Leondar, 1968, p. 104). "The old man thought of the world as evil. 'He is like a hermit in the

thirty-two similes in this book seemed to function directly in this first capacity some observations may be in order. The main topic seemed to be supported largely by the metaphor "the little fishes" in referring to these children. Not only did Haugaard select this metaphor as his title, but it was repeated eight times throughout the story. It was first found on page four where Haugaard had a German soldier say, "In the unclean waters live the little fishes. Some are eaten; most, I believe. But some will escape." Its final use came at the end of the story when the main character, a homeless child, says to himself, "You are a little fish, but your fins are strong; and you know the sight of a hook" (p. 196). These observations seem to indicate what a very significant function a single figure of speech (a metaphor in this case) can perform in a book. That a child adequately grasp the implications of such a figure would add immeasurably to his understanding of the story.

Reinforces Main Theme

To the writer the main theme of this story seemed to be "strength" or "strength with kindness." Three similes reinforced this theme. The vehicle of each of the three similes was the same — "iron"—but each time it was applied to a different person subject. In the first instance Guido, the main character, learned that his grandmother was afraid of his grandfather because, "He was so strong. Duro . . . like iron" (p. 42). Soon after Guido found himself completely alone in the world.

middle of the city, Father Pietro once said of him, (p. 25) is an example. It serves as a rather succinct explanation of the philosophy and behavior of a story character.

Elaborates Style

Finally there is the ornamental simile. Leondar (1968, p. 104) made some pertinent comments.

The doctrine of ornament in its purely descriptive aspect points to a group of figures which say nothing that cannot be captured with like fulness, though perhaps not with like economy and grace, in literal speech. . . the ornamental metaphor ornaments only in the sense that it is optional rather than integral. It permits replacement without loss or distortion of content by other forms of expression.

An example of such a simile follows: "As he repeated himself, the officer's voice broke and he sounded like an angry child" (p. 172). Haugaard could have written "... the officer's voice broke and sounded angry and childish." Nearly one third of the similes in The Little Fishes seemed to fit this category. They added to the author's style although they were not essential to the content of the story.

Summary

It seemed that similes indeed may fill a variety of functions in a story in varying numerical proportions. In The Little Fishes some similes were merely decorative while others played key roles involving the theme and the plot of the whole book. The bulk of the similes seemed to serve the reader as a means of explanation or a means to the discovery of an idea significant to the author.

CHAPTER VI

SUMMARY OF THE STUDY

Students frequently experience difficulty in understanding the similes which they encounter in their reading material. Although these similes occur often, little is known about them. Before deciding how to prepare the child to read similes, it was thought that more information about similes was necessary. Most children have access to a school library in which a large proportion of the books is often fiction. It was anticipated that this fiction would contain similes; therefore, the purpose of this study was two-fold. Initially, fiction considered suitable for children in grades four, five and six and commonly recommended for Canadian school libraries was identified. Secondly, a sample of similes from these books was described.

Presented in this chapter will be a brief summary of the study, major findings and conclusions, possible implications, suggestions for further research and a concluding statement.

SUMMARY

A list of fiction was compiled from nine lists which were recommended by professors in the School of Library Science as used for book selection in Canadian elementary school libraries. From this total population of 562 titles a random sample of twenty books then was selected, stratified in four categories based on particular favor

on American and/or Canadian book lists.

In these twenty books 769 similes were identified and this total population of similes was described quantitatively.

From the total population, fifty similes were randomly selected for qualitative description.

Finally all the similes in a single book selected for this purpose were examined to gain more information about the function of each simile within that book.

MAJOR FINDINGS AND CONCLUSIONS

The findings with their attendant conclusions are summarized with regard to the identification of fiction and then the description of similes quantitatively, qualitatively and functionally.

Fiction Identified

A list of fiction considered suitable for children in the intermediate grades and commonly recommended on lists used for book selection in Canadian school libraries was compiled and presented in Chapter III. It consisted of 562 titles.

It was evident from the compilation of titles that there was little unanimity between the book lists as to titles that were recommended. Thus three quarters of the books were classified as Category D (highly favored on neither Canadian nor American lists). There was a distinction between titles highly favoured on Canadian lists and those highly favored on American lists. For example, nearly 15 percent of the titles were highly favored on Canadian lists only; less

than 5 percent were highly favored on American lists only; and less than 5 percent of the titles were highly favored on both Canadian and American lists.

Similes Described Quantitatively

In question two. Many similes did occur in the children's fiction though the number in a particular book varied from 1 to 174. The average number of similes found in a book was thirty-eight.

That the number of similes a child may confront in a book might be large or nearly negligible, depending on the particular book, was concluded from this finding. However, for the child who reads fiction to a large extent, a considerable number of similes would be presented to him to read.

In question three. Books containing the lowest density of similes were not necessarily either recent or older books. However, from the over-all calculations it was found that the density of similes per page or per one thousand words was somewhat greater in the ten recent books than it was in the ten older books.

It was concluded that this finding indicates a possible trend among modern writers of children's fiction to use simile more frequently than writers of the past. Instead of finding a simile on approximately every five pages, the reader of a more recently published book could expect to find a simile approximately every three or four pages.

In question four. It was found that authors did not distribute

similes evenly throughout their books. The greatest proportion of similes were found in the beginning fifths of the books and the smallest proportion in the central fifths. However, this over-all pattern was not representative of some of the distribution patterns of individual books. It was further found that over half of the similes occurred on pages containing at least one other simile. Sometimes three or four similes occurred on a single page. Nearly a fifth of the similes occurred in clusters.

Thus it seems that the child has to adjust to reading similes in varying concentrations. Usually he may encounter the largest number of similes at the beginning of a book and the smallest number in the middle. Very often he will have to read several similes on a page, frequently with two or more in close succession.

Similes Described Qualitatively

In question five. It was found that the elements of 78 percent of the similes occurred in simple patterns. That is, each simile had a single subject, link and vehicle. These elements sometimes occurred in different sequences though the most common sequence was subject, link, vehicle. The remaining similes followed somewhat more complex patterns. Either there were two vehicles to describe a single subject, or the subject and vehicle occurred in a kind of analogical relation—ship. Two similes were characterized by both kinds of complexity. One author used a noticeably larger proportion of complex-patterned similes than did the other authors.

Therefore, it would seem that the child reader could expect

three quarters of the similes that he reads to be patterned simply. However, he must be prepared to encounter the elements of these similes in a variety of sequences. In approximately a quarter of the similes he reads he may expect to find the elements structured in complex patterns. Some books may contain proportionately more complex similes than others.

In question six. In both simple and more complex similes commonalities of subjects and vehicles were most often stated within the simile. In only ten of the fifty similes were commonalities not stated. For twenty-six of the fifty similes commonalities of subject and vehicle were suggested by the author in the context surrounding the simile sentence. In only four of the fifty similes were commonalities neither stated within the simile nor implied in the context around it. About an equal number of the commonalities of subjects and vehicles were actions as were descriptions.

Therefore, from these findings it would seem that children can expect authors to give them considerable assistance in identifying the commonalities in similes by direct statement and/or by contextual implication. Occasionally, however, children will be left to their own resources.

In question seven. Sixty-five of the seventy-eight subjects and vehicles of simple similes were concrete. The largest number of these elements were objects. Of the thirteen non-concrete elements of the simple similes, nine (mostly vehicles) were classified as

to different categories. In none of the similes of complex structure did all the simile elements belong in a single category.

Therefore, it would seem that in the majority of similes, subject and vehicle are indeed quite dissimilar and thus at least in this sense most similes should be "interesting" to the reader.

In question eight. Within the fifty similes there were sixty-one words considered uncommon in children's reading material according to Thorndike and Lorge (1959) and this vocabulary involved thirty-three of the similes. Whereas for the uncommon words occurring in both subject and commonality at least as many units of information in the context were provided, this was not so with the vehicles. While the largest number of uncommon words occurred in the vehicles, the units of information were proportionately far fewer.

So it seems that children often do encounter vocabulary in similes that is uncommon in their reading material. For the uncommon words in the subjects and commonalities of similes the child may expect considerable assistance from the context in obtaining meaning. However, slightly less than half of the uncommon words may occur in vehicles that are imported into the context to describe subjects. For these words the child can be less certain of finding clues to meanings in the context.

In question nine. In nineteen of the fifty similes, the subject was represented by a pronoun. Up to ninety-eight words intervened between the pronoun and its subject antecedent. Other types

"other." Several of these were imaginary beings. As with the simple-patterned similes, in the more complex-patterned similes the majority of elements were "concrete objects." "Non-concrete actions" contained the next largest number of elements though for the most part primary terms were not included in these.

Most of the subjects and vehicles of similes are concrete.

Thus, for the child reader whose thinking still takes place largely in the realm of the concrete, most of the terms he encounters in similes belong to that realm. The child reader, however, may expect an author to introduce non-concrete vehicles to describe subjects approximately one fourth of the time. Some of these vehicles may be imaginary beings with which the child has no experience and possibly little idea of what they are supposed to represent. When the pattern of the simile is complicated there is more likelihood of the elements being non-concrete than when the simile pattern is simple. Thus the reader's difficulties with similes of complex structure may be compounded by the non-concrete nature of their elements.

It was found that in the similes in one book a larger proportion of the elements were non-concrete than in the other books. One would conclude that books by authors using a large proportion of non-concrete elements in their similes would present the child with greater reading complexities.

As was mentioned in Chapter II, the interest of a simile depends largely on the disparity between the subject and vehicle of that simile. It was interesting to note that in two thirds of the simple similes the subject and vehicle were classified as belonging

of complications in simile sentences were noted.

A child frequently may expect to find similes situated in grammatically complex sentence structure. Sometimes the subject of a simile may be considerably removed from the pronoun representing it in the sentence.

Similes Described Functionally

From a review of all the similes in <u>The Little Fishes</u>, a hierarchy of five categories of possible simile functions seemed to emerge. Proceeding from the most functionally significant these were: supports main topic, reinforces main theme, develops plot by anticipating or connecting action, explains or discovers new thought, elaborates style. Some similes functioning in upper levels of the hierarchy also seemed to have additional functions at lower levels. Nearly half of the similes seemed to explain or discover a new thought. The second, third and fourth largest groups of similes respectively elaborated style, developed plot and reinforced the main theme.

Thus it seems that similes may fill functions of varying significance in the development of a book. At least three quarters of the similes may not be mere elaboration, but rather an author's attempt to communicate a key idea. Functionally significant similes, particularly those with plural functions, would seem to be the most important for children adequately to interpret.

189

IMPLICATIONS

The implications of these findings and conclusions have pertinence for educators, authors and school librarians:

- 1. Because there seems to be little unanimity between book lists as to the titles recommended, several book lists should be used for selection for the school library in order to include a wider range of books reflecting the professional judgments of a greater number of specialists. Among these should be Canadian lists, as American lists do not seem to include the best in Canadian fiction.
- 2. It would seem that the structure of some sentences in which similes occur is complicated unnecessarily to no apparent advantage. While instruction may increase children's ability to interpret such similes, authors should attempt to use sentence structures that facilitate communication with their readers in the intermediate grades.

Authors also need to be wary of presenting a functionally significant simile with several complications, for example, a complex pattern of elements with uncommon vocabulary and unstated commonalities.

- 3. As particular books may contain too large a proportion of similes unsuited to many potential readers, librarians and teachers need to be aware of such characteristics of a book when guiding individual children in book selection.
- 4. For the child who reads fiction, similes seem to be inescapable. Moreover on the basis of this study, it would appear that the use of similes by authors is on the increase. Thus it seems of

- 4.4 While most similes are comparisons of the concrete, children may need instruction to be alert to non-concrete exceptions, particularly in the term the author introduces as the vehicle.
- 4.5 Children need to be educated to the various functions that individual similes may perform in a book. They need to be aware that authors may present a simile for a particular purpose, sometimes more significant than others. That some similes play key roles in the context of the entire book should be also understood by children.

SUGGESTIONS FOR FURTHER RESEARCH

From the viewpoint of this study there appear to be several suggestions for further research:

- 1. Books commonly recommended for children in grades four, five and six are not necessarily those books most often read by these children. It is suggested, then, that fiction most commonly read by Canadian children in the upper elementary grades be identified in order to discover which of the recommended books are read most often.
- 2. This study has described some characteristics of similes. However, other studies are needed to reveal the extent that these characteristics affect the understanding of similes by children. Variations in children's interpretations could be compared as the following characteristics of similes are controlled:
 - 2.1 Pattern of elements (simple versus complex),
- 2.2 Commonality of subject and vehicle (stated and implied versus stated only, implied only, not stated or implied),

- 2.3 Density (several similes in a limited context versus similes spread further apart),
 - 2.4 Subjects and vehicles (concrete versus non-concrete),
- 2.5 Uncommon vocabulary (clues to meaning provided in context versus no clues provided),
 - 2.6 Sentence structure (altered in various ways).
- 3. A comparison of characteristics of similes that children use in their oral and written communication with the similes authors use to communicate with children is suggested in order to probe communication gaps between author and reader.
- 4. Other characteristics of similes need to be investigated. For example, which similes affect the child's thinking by concealing facts, inciting attitudes, or simply causing distraction.
- 5. Further analysis could be done on similes to investigate the extent of combined complexities within individual similes.
- 6. A variety of techniques and materials for teaching children the necessary skills for simile reading need to be developed and tested.
- 7. Finally, similes are only one type of figurative language found in children's fiction. Similar descriptions of other figures of speech are necessary for a more complete perspective.

CONCLUDING STATEMENT

This study has identified fiction and described certain aspects of similes that may affect how they are interpreted by the

increasing importance that children encouraged to read fiction from the school library be prepared through instruction to read similes in books. This instruction should have several aspects:

- 4.1 Because the concentration of similes does not seem to be constant throughout any particular book, children may need to be taught to recognize and interpret similes whether they are presented individually and occasionally or when a number occur in close proximity.
- 4.2 Since authors structure their similes in different patterns, some children may need teaching to adapt the various mental manoeuvres required to arrive at the author's tenor. As similes vary in complexity, it would seem that children first should be taught to read simple similes (these are more common in any case) with the essential elements arranged in different sequences, before being taught to read more complex similes.
- 4.3 Because some similes do not include a stated commonality, children probably need practice deducing commonalities of subjects and vehicles that are true to the child's own background of experiences and relevant to the author's meaning. As commonalities frequently are implied in the context, children may need assistance in learning to use contextual clues rather than attempting to interpret the simile in isolation.

Also, while children may encounter words unfamiliar to them in similes, practice again may enable them to use the context to arrive at the meanings of most of these words.

children reading them. It is hoped that information generated from this description may contribute to the facility of communication between the authors and readers of similes in children's fiction. BIBLIOGRAPHY

FIFTY SIMILES USED IN QUALITATIVE DESCRIPTION

The Bushbabies

Simile 1, Page 10

There were mother baboons with beetlebrows and up-curling tails like whips, and pink babies who rode piggyback or swung from adult bellies.

Simile 2, Page 11

The incident deepened Jackie's resolve to guard the bushbaby closely. She swore a private oath that she would never abandon him, no matter what, and carried him everywhere in those last few months, even taking him to bed with her.

He was like a gnome, hopping always in close company with her, or curling up in a ball under her shirt. His species was known to Africans as "the tree dwarfs," and Kamau especially seemed to possess an almost human sense of mischief.

Simile 3, Page 13

Now all the animals were on the move, faintly visible from the train. . . .

Andrew, watching through the window, grew pensive. He understood why the bushbaby could not be released. It would be like throwing a small child into an arena of lions.

Simile 4, Page 126

At the very center was a small black waterhole.

The wind, blowing from the waterhole toward them, carried a sound like a train puffing uphill.

Simile 5, Page 133

A flock of helmeted guineafowl trotted down the ridges of the saltlick, heads bobbing, legs twinkling, chattering away like children on an outing.

Simile 6, Page 152

The archaeologist craned forward like an ostrich.

Simile 7, Page 159

The baby elephant's cries aroused the girl from her stupor.

She gazed for long seconds at the darkening sky, herding her thoughts together like strayed sheep.

APPENDIX B

FIFTY SIMILES USED IN QUALITATIVE DESCRIPTION

Simile 15, Page 26

The attack came with a silent uprush of shadows that swarmed in from every side, flowing up to the turf ramparts with a speed, an impetus that, ditch or no ditch, must have carried them over into the camp if there had been only the sentries to bar the way. They were flinging brushwood bundles into the ditch to form causeways; swarming over, they had poles to scale the ramparts, but in the dark nothing of that could be seen, only a flowing up and over, like a wave of ghosts. For a few moments the utter silence gave sheer goose-flesh horror to the attack; Every yard of the ramparts was a reeling, roaring battle-line as the tribesmen swarmed across the breastwork to be met by the grim defenders within.

Simile 16, Page 57

The net whipped out like a dark flame; it licked round the running swordsman, so intent on his chase that he had forgotten to guard for it; the weight carried the deadly folds across and across again, and a howl burst from the crowd as he crashed headlong and rolled over, helplessly meshed as a fly in a spider's web.

Simile 17, Page 92

A long while later he drifted out of the darkness that had come roaring up over him before the work was finished, to find himself lying under warm rugs, with Rufrius Galarius standing beside him with a square hand set over his heart, as old Aulus had stood in that other waking, just a year ago. For one confused moment he thought that it was still that other waking and he had dreamed in a circle; and then, as his sight and hearing cleared somewhat, he saw Esca standing just behind the surgeon, and a huge shadow in the doorway that could only be Uncle Aquila, and heard the despairing howls of Cub shut in the storeroom: and came back to the present like a swimmer breaking surface.

Simile 18, Page 148

"They took me in and tended me. Murna tended me. And when they found that I was a Roman soldier, they did not greatly care. I was not the first of my kind to desert to the tribes; and Murna spoke for me, like a lioness whose cub is threatened."

Simile 8, Page 219

He led the bull to his mother who seized it by the head, which she twisted over her skinny thigh. Then she took a firm grip on the bull's neck, so that the jugular vein swelled like damp rope.

Simile 9, Page 235

Floating in the branches were the bloated carcasses of animals, legs stiff and pointing to the sky, lifeless as upturned sofas.

Simile 10, Page 239

Jackie saw that small knots of zebra had gathered like pretty pebbles in the lee of crumbling cliffs.

Simile 11, Page 265

The bushbaby was endowed by nature with a variety of highly tuned senses. His ears moved like radar scoops, catching every small sound.

The Eagle of the Ninth

Simile 12, Page 15

The leather apron over the doorway was drawn aside at once, but instead of the hunter, there appeared a girl with a solemn sunburned baby on her hip. She was tall, as were most British women, and carried herself like a queen;

Simile 13, Page 16

"May I see your team?" he asked, and the other stood aside for him without a word.

The four were loose in their stable, and they came to him almost like dogs to sniff inquiringly at his breast and outstretched hands; four superbly matched black chariot ponies.

Simile 14, Page 25

He felt the Duty Centurion grow tense as a strung bow beside him. The moments crawled by, the silence became a physical pressure on his eardrums. Then the sounds came again, and with the sounds, blurred forms moved suddenly on the darkness of the open turf below the ramparts.

Marcus could almost hear the twang of breaking tension.

Simile 19, Page 153

On an evening more than a month later, Marcus and Esca reined in to breathe their tired horses, on the crest of a steep ridge above the Western Ocean. It was an evening coloured like a dove's breast; a little wind feathered the shining water, and far out on the dreaming brightness many scattered islands seemed to float lightly as sleeping sea-birds.

Simile 20, Page 163

A man's shape showed for an instant high among the thorntrees, and again the horn sounded its high clear note; and before the echoes had died among the hills, the sealskin curtain was flung back, its bronze discs clashing like cymbals.

Simile 21, Page 177

Yes, it was the Eagle all right. ...

He lifted it from its place, realizing as he did so that the last Roman hand to touch the stained and battered shaft had been his father's. An odd, potent link across the years, and he held to it as to a talisman, as he set about freeing the Eagle from its staff.

Simile 22, Page 179

Suddenly he remembered the flood of sunset light in his sleeping-cell at Calleva, that evening when Esca and Cub and Cottia had come to him in his desperate need. He called it up now, like golden water, like a trumpet call, the Light of Mithras. He hurled it against the darkness, forcing it back--back--back.

Simile 23, Page 202

The ponies were fairly fresh, but both fugitives knew that in the open it was only a matter of time before they were ridden down by the better-mounted tribesmen-pulled down by the yelling hounds as by a pack of wolves.

Simil∈ 24, Page 202

For one flashing instant there rose in him the exultancy of speed, the surge and spendour that he had once thought never to know again. The instant passed, swift as the darting flight of a kingfisher.

Simile 31, Page 150

"But after Mrs. Ravenel had twitched and glared through a piece or two, Clay Delaney would play some songs on his mandolin, and we all loved him and nobody wanted to laugh then. After that there'd be something else, Mary Humboldt playing on the harp or Mr. Vogelhart seesawing away on his violin. That wasn't funny, only boring, and Baby-Belle said it caused her to itch all over like chicken pox."

Simile 32, Page 150

"Then Mrs. Brace-Gideon would come sailing in like a battleship and start to sing." Mrs. Cheever began laughing helplessly. "Oh, it was so-oh, she was so..."

After a moment she continued. "Even her voice was solid! Enormous! Strong! Hard! She sang in German and she sang in English it didn't sound at all like American (though she came from Pittsburgh); it didn't even sound like English. All ner necklaces would tremble and glitter, and the glass things on the chandelier began to shake, and we shook, too, with our held-back giggles."

Simile 33, Page 168

When they walked through the swamp nowadays, they had to wear their boots (slop, slop) and look out for cobwebs.

"This is the season of the spider," Mr. Payton said, and it was certainly true. Everywhere, tossing among the reeds, were little beaded cloths of web, and now and then they came on a larger kind, each wearing a dressy black-and-yellow spider and marked with a silky track as if the artist had signed his name.

Simile 34, Page 169

As Mrs. Cheever had said, the woods had captured the Villa Caprice long ago; and the thing that made many of the trees seem spooky was the fact that they were draped and festooned with matted honeysuckle vines, so that they looked less like trees than like great shawled figures, stooping, or like sinking vessels wrapped in their sails.

Simile 35, Page 192

This prospect made Foster so happy that he had to run. He had to jump.

"Come on, Gull, old boy! Come on, Dave!"

Off they went, bucking and yelling, as wild as Tuscarora Indians.

Heidi

Simile 36, Page 53

"But surely it does in summer, grandmother," said Heidi, more and more anxious to find some way out of the trouble, "when the hot sun is shining down again, and he says good-night to the mountains, and they all turn on fire, and the yellow flowers shine like gold, then, you will see, it will be bright and beautiful for you again."

Simile 37, Page 283

Peter, however, had never given his arm to any one in his life. Clara put hers in his, but he kept his own hanging down straight beside him like a stick.

Impunity Jane

Simile 38, Page 26

The snail had a polished brown shell with smoke-curl markings. Gideon used to take her out and put her down to eat on the grass; then a head with two horns like a little cow came out one side of the shell and a small curved tail at the other; the tail left a smeary silvery trail like glue; it made the inside of Gideon's pocket beautifully sticky.

The Little Fishes

Simile 39, Page 25

The old man thought of the world as evil. "He is like a hermit in the middle of a city," Father Pietro once said of him.

Simile 40, Page 140

"And do you know what New York looks like because you know the name?"

Anna was silent for several minutes. "It is a very rich city," she suddenly began. "Not like Naples. But there is water like there is around our city, and it has little islands like Ischia and Capri. It has many churches with great big spires; and every one is of gold; and when the sun comes up in the morning, they look like golden sewing needles.

Simile 41, Page 161

Dead leaves follow the wind and have no resting place during a storm. The twig that has fallen into the river goes where the stream carries it. The poor are like the leaves in the storm or the twig in the river; plaything of forces which they do not control, which they sometimes do not even understand.

Little Witch

Simile 42, Page 33

Suddenly she gave a little cry. There in the mirror—surely, oh surely it was a face! A beautiful face, pale as moon—light, with night-dark eyes, a flower-soft mouth.

Nkwala

Simile 43, Page 10

His heart no longer jumped at every sound. True, he was wary. His eyes and ears had grown doubly keen. Through experience he now felt sure that most of the wild animals would slip away like shadows from his path. Most of them, that is, except the porcupine.

Simile 44, Page 44

Then the littler young ones shrieked and capered and danced in the white flash of the driving rain. Thirsty, they lifted open—mouthed faces to the sky like hungry nestlings that hear the rustling return of the mother bird.

A Pony Called Lightning

Simile 45, Page 40

Broomtail's eyes were as bright as sunlight. He had big teeth which showed when he laughed. He kicked his back heels high in the air, and then stood on his back legs and kicked his front heels in the air.

Simile 46, Page 124

But soon he was so far behind that Lightning could not hear his words. The pony tossed his head. "I can outrun any pony on the plains!" he snorted.

Then he heard a long, sad cry. It was the train, going across the plains. Black smoke waved like a tail behind it.

212

Simile 25, Page 215

They swung in their tracks, towards the nearest tongue of the birch woods that were spreading like a stain through the ragged mist, but even as they did so, the signal cry rose from among the golden trees in answer.

Ellen and the Gang

Simile 26, Page 103

"The minute my back was turned, she pushed her way out."

"She was just like a wild animal," a woman in the store said. "She knocked me over."

Simile 27, Page 185

I've had the feeling that this playground is like a little world, the kind of nice world we'd all like to live in. Children of different backgrounds, different colors, and different religions all play together.

Gone-Away Lake

Simile 28, Page 57

In the huge swinging maple tree the oriole stopped his work from time to time and sang. The house wrens sang, too, but their song seemed more in the nature of conversation, and in the woods a certain red cardinal sounded like a little bottle being filled up, up, up with some clear liquid.

Simile 29, Page 93

"I know," she said, for she had heard it, too: the silvery pealing of a choir of frogs. "There must be a million of them in the swamp."

 $\ddot{\ }$ "I. like their singing better than the birds'," Julian said, "because they all know the same tune."

The swamp, when they came in sight of it, was stirring in the wet wind like cats' fur. The broken houses were soaked dark with rain.

Simile 30, Page 95

The Big House was big; bigger than Belle-mere. It had a flight of wooden steps leading up to a porch, which sagged like the brim of a hat. They tiptoed across this carefully, feeling it tremble.

The Return of the Twelves

Simile 47, Page 19

The wooden soldiers stood exactly as he had seen them when Jane interrupted. They hadn't moved a tenth of an inch. They were as dead as ninepins. They had frozen again.

Simile 48, Page 129

Jane observed, too, how like a tiny ape's was the brighteyed, snubby face of Monkey [a wooden soldier]. He behaved like a monkey, climbing everywhere he could find--something he must have learned when he was a midshipman on the Invincible.

Simile 49, Page 72

By degrees the dancing mania seemed to seize upon all the other pieces of furniture.... In short, all the movables got in motion, capering about; pirouetting, hands across, right and left, like so many devils....

Simile 50, Page 98

...Owing to the vast antiquity, the style of architecture is somewhat odd, but it is not for that reason the less strikingly picturesque. They [the buildings] are fashioned of hardburned little bricks, red, with black ends, so that the walls look like a chessboard upon a great scale.
