AVIS

The quality of this microform is heavily dependent upon the quality of the original thesis submitted for microfilming. Every effort has been made to ensure the highest quality of reproduction possible.

NOTICE

If pages are missing, contact the university which granted the degree.

Some pages may have indistinct print especially if the original pages were typed with a poor typewriter ribbon or if the university sent us an inferior photocopy.

Reproduction in full or in part of this microform is governed by the Canadian Copyright Act, R.S.C. 1970, c. C-30, and subsequent amendments. La qualité de cette microforme dépend grandement de la qualité de la thèse soumise au microfilmage. Nous avons tout fait pour assurer une qualité supérieure de reproduction.

S'il manque des pages, veuillez communiquer avec l'université qui a conféré le grade.

La qualité d'impression de certaines pages peut laisser à désirer, surtout si les pages originales ont été dactylographiées à l'aide d'un ruban usé ou si l'université nous a fait parvenir une photocopie de qualité inférieure.

La reproduction, même partielle, de cette microforme est soumise à la Loi canadienne sur le droit d'auteur, SRC 1970, c. C-30, et ses amendements subséquents.

ABSTRACT

This thesis reports the results of three projects:

1 The development of a procedure for the ozonolytic cleavage of carbon-carbon double bonds in the presence of phenylseleno groups elsewhere in the substrate. The procedure entails oxidative cleavage of the olefin followed by reduction of both the formed ozonide and selenoxide by triphenylphosphine to the corresponding carbonyl compound and selenide, respectively. Such a procedure extends the utility of the phenylseleno group because it had hitherto been introduced only *after* double bond cleavage operations. My experiments have shown that this restriction is unnecessary.

2 The discovery of a method for carrying out radical cyclizations onto the carbonyl group of an aldehyde function. The procedure involved the use of triethylborane mediated 6-*exo* radical cyclization onto an aldehyde group. This procedure was used to construct bicyclic compounds with *trans* ring fusion. Closure onto an aldehyde had been observed previously, but only under special and synthetically limited conditions. The present methodology removes such restrictions.

3 Synthetic work aimed at the synthesis of *myo*-inositol 1,4,5-triphosphate by a method that involves an intramolecular ene reaction with a substrate that was built up from D-glucose.

ACKNOWLEDGMENTS

I would like to express my gratitude to Professor D. L. J. Clive for his advice, encouragement, and training during the course of my studies, and for his assistance in the preparation of this thesis.

The help of the technical staff of the Chemistry Department is appreciated, in particular the NMR technical staff provided considerable assistance and training on the high-field NMR spectrometers.

Special thanks goes to Professor Ole Hindsgaul and Dr. Todd Lowary for imparting some of their carbohydrate knowledge to me.

I would like to thank my friends and co-workers who have helped me in one way or another over the last five years.

None of this work would have been possible without the long distance support of my Family and for this, I am grateful.

Special thanks also goes to Otis for his advice and encouragement.

Finally I would like to thank Mara for her encouragement and sage advice in helping me bring my work here in Edmonton to completion.

Chapter 1

Ozonolysis of Olefinic Phenyl Selenides with Preservation of the Selenium Unit: A Route to Phenylseleno Aldehydes and Ketones

.

.

INTRODUCTION

The phenylseleno group occupies an important place in modern organic synthesis.¹ The main characteristics of the phenylseleno group (PhSe) are that it is sensitive to oxidation and is converted by a number of oxidizing procedures into the corresponding selenoxide.² This process constitutes an extremely efficient and exceptionally useful method for forming carbon-carbon double bonds, as the selenoxide collapses easily to an alkene, and its value is attested by the hundreds of examples that have appeared in the literature.¹ A few are shown in Scheme I-1.³⁻⁵

Scheme I-1

The general applicability of the phenylseleno group in organic synthesis relies on the ease of its introduction. Both nucleophilic and electrophilic selenium species have been developed. A few examples outlining the use of nucleophilic selenium are shown in Scheme I-2.6-9

Scheme I-2

The chemistry of electrophilic selenium is a very rich and fertile area, and representative examples of selenocyclization, α -selenation of ketones and alkoxy selenation of olefins are shown in Schemes I-3^{10, 11} and I-4.¹²

Scheme I-3

Scheme I-4

Another characteristic of the phenylseleno group is that it is not expected to survive hydrogenation conditions (H₂ Pd/C) and becausese of this expectation (based mainly on comparison with sulfur) there very few examples in the literature which involve hydrogenation processes of molecules containing the phenylseleno group. Those that are known to me are summarized in Scheme I-5.^{13, 14}

Scheme I-5

For these reasons, although the phenylseleno group is important-particularly as a method of generating carbon-carbon double bonds-its introduction into a molecule has hitherto been timed after careful consideration of the subsequent reaction conditions to which the molecule would be exposed, while still having to retain the selenium function. In particular, oxidative conditions in the presence of the phenylseleno group are generally avoided. There a few exceptions to this though. It is known, for example, that alcohols containing the phenylseleno group, under carefully defined conditions listed in Scheme I-6, can be converted into

carbonyl compounds, but this procedure of alcohol oxidation is not often used.¹⁵⁻¹⁸

RESULTS and DISCUSSION

It has been known for a several years that the oxidation of selenides with ozone constitutes an effective method of making the selenoxide,¹⁹ and hence the corresponding olefin.¹ Kinetic data¹⁹ have shown that a phenylseleno group is oxidized much faster than a carbon-carbon double bond. However, it occurred to us that if an olefinic substrate containing a phenylseleno group were ozonized at a low temperature it may be possible to work up the reaction under such conditions that not only would the initial selenoxide (whose fragmentation we would anticipate to be slow at -78°C) be reduced back to the thermally stable selenide, but concomitant reduction of the ozonide or related species would also occur. If this were the case, then a phenylseleno group could be introduced in a synthetic sequence prior to the planned use of ozonolytic conditions. This would allow a much broader window of opportunity for the introduction of the phenyl selenide function.

We have studied a number of simple cases in which a carbon-carbon double bond and a phenylseleno group are present in the same molecule and have found that our speculations are indeed realized in practice. The olefinic selenides **12**, **15** and **16** were prepared by standard methods as shown in Scheme I-7.

Scheme I-7

Thus, compounds 12, 14, and 16 were subjected under classical conditions to the action of ozone, and the resulting selenoxide-ozonide was exposed to the reducing agent triphenyl phosphine to furnish the benzeneseleno aldehydes 11, 13, and 15 in good yield, Scheme I-8. We have examined only triphenylphosphine as a reducing agent,²⁰ but we suspect that a number of other reducing agents, such as sodium sulfite, may also prove suitable. As can be seen from the examples shown in Scheme I-8 the double bond is oxidatively cleaved and the selenium unit retained.

7

This is true even in the case of the example shown in Scheme I-9, wherein the intermediate selenoxide should be particularly labile because its collapse would generate an α , β -unsaturated carbonyl system.

Scheme I-9

Even in this case, the yield is 50% and this modest yield is a reflection not of the undesired selenoxide fragmentation, but of the fact that selenide 17 is itself not particularly stable to silica gel chromatography. When we subjected a sample of selenide 17 to flash chromatography a 10% loss of material was observed.

Some of our compounds are primary selenides and it is known that primary selenoxides are much more stable than secondary selenoxides.²¹ Consequently, we also examined the secondary selenide **20** and found that it underwent cleavage and subsequent reduction to aldehyde **21** in 76% yield, indicating that the methodology is not restricted to primary selenides, Scheme I-10.

Scheme I-10

We conclude that the phenylseleno group can indeed be introduced before steps that involve ozonolytic cleavage of a double bond, and we believe that this information extends the synthetic utility of the phenylseleno group. One case in point is represented by our attempts to prepare the phenylseleno methyl aldehyde **22**, Fig. I-1.

Figure I-1

We made a number of unsuccessful attempts to prepare this compound by routes that delayed introduction of the selenide function (Scheme I-11), but we found that the present route (Scheme I-12) is by far the best.

Further work is underway in this laboratory to accumulate a broader range of examples of the ozonolysis of olefinic selenides with retention of the selenium unit.

EXPERIMENTAL

General. Argon was purified by passage through a column $(3.5 \times 42 \text{ cm})$ of R-311 catalyst and then through a similar column of Drierite. Glassware was either flamedried or dried in an oven for at least 3 h before use (120 °C) and cooled in a desiccator over Drierite, or assembled quickly, sealed with rubber septa, and allowed to cool under a slight static pressure of argon. Reaction mixtures were stirred by Tefloncoated magnetic stirring bars. Organic solutions were dried with MgSO₄, unless otherwise stated.

Solvents for chromatography were distilled before use. Petroleum ether refers to the fraction bp 35-60°C.

Products were isolated from solution by evaporation under water-pump vacuum at, or below, 30 °C, using a rotary evaporator.

Melting points were determined on a Kofler block melting point apparatus.

Commercial thin layer chromatography (TLC) plates (silica gel, Merck 60 F—254) were used. Spots were detected by examination under UV light and then by spraying the plate with a solution of phosphomolybdic acid, followed by charring on a hot plate. Silica gel for flash chromatography was Merck type 60 (230-400 mesh).

Dry solvents were prepared under an inert atmosphere and transferred by oven-dried syringes or cannulas. Dry tetrahydrofuran and diethyl ether were distilled from sodium and benzophenone ketyl. Dry methanol and ethanol were distilled from magnesium methoxide and magnesium ethoxide, respectively. Dry benzene and toluene were distilled from sodium. Dry diisopropylamine, triethylamine, dichloromethane, pyridine, and N,N-dimethylformamide were distilled from calcium hydride, the last solvent being distilled under water-pump vacuum. Commercial (Aldrich) solutions of n-butyllithium and methyllithium (both in hexanes) were assumed to have the stated molarity.

Ozonolysis were peformed with a Helsbach ozonizer.

Infrared spectra were recorded on a Nicolet 7000 FT-IR model. Measurements were made as casts from the specified solvent and using potassium bromide plates.

Proton nuclear magnetic resonance spectra were recorded with Bruker WP-200 (at 200 MHz), Bruker AM-300 (at 300 MHz), or Bruker AM-400 (at 400 MHz) spectrometers in the specified deuterated solvent with tetramethylsilane as an internal standard. ¹³C NMR spectra were recorded with Bruker WP-200 (at 50.3 MHz), Bruker AM-300 (at 75.5 MHz), or Bruker AM-400 (at 100.6 MHz) spectrometers using deuterochloroform as an internal standard. The symbols s', d', t', and q' used for ¹³C NMR signals indicate 0, 1, 2, or 3 attached hydrogens, respectively.

Mass spectra were recorded with an AEI Model MS-12 or MS-50 mass spectrometer at an ionizing voltage of 70eV.

Microanalyses were performed by the microanalytical laboratory of this Department.

Compounds in Chapter 1 and 2 of this Thesis are racemic. The compounds synthesized in Chapter 3 of this work are optically pure.

5-(Phenylseleno)pentanal (11).

A solution of DIBAL (14.27 mL, 1.0M solution in CH₂Cl₂, 14.27 mmol) was added dropwise to a cold (-78°C) and stirred solution of **10** in CH₂Cl₂ (60 mL) via syringe over ca. 4 min. The resulting solution was stirred at -78°C for 30 min and then Na₂SO₄·10H₂O (4.0 g) was added in one portion, and the cold bath removed. Stirring was continued for 1 h, anhydrous Na₂SO₄ (10 g) was added, and the mixture was filtered through Celite (3 x 6 cm), using CH₂Cl₂ (200 mL) as eluent. The filtrate was evaporated, and flash chromatography of the residue over silica gel (3 x 21 cm), using 8% EtOAc-hexane, gave **11** (2.8201 g, 82%) as a pure [¹H NMR (400 MHz)] oil: FT-IR (CH₂Cl₂ cast) 3056, 2934, 2886, 2821, 2722, 1722, 1578, 1478, 1437 cm⁻ ¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.67-1.79 (m, including a t at δ 1.72, *J* = 4 Hz, 2 H), 2.36-2.48 (m, including a d at δ 2.41, *J* = 1.5 Hz, 2 H), 2.85-2.98 (m, including a t at δ 2.90, *J* = 7 Hz, 2 H), 7.20-7.30 (m, 3 H), 7.41-7.52 (m, 2 H), 9.71 (t, *J* = 1.5 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.90 (t'), 27.12 (t'), 29.32 (t'), 42.99 (t'), 126.62 (d'), 128.67 (d'), 130.02 (s'), 132.34 (d'), 201.76 (d'); exact mass, *m/z* calcd for C₁₁H₁₄OSe 242.1210, found 242.1211. Anal. Calcd for C₁₁H₁₄OSe: C, 54.78; H. 5.85. Found: C, 54.72; H, 5.91.

6-(Phenylseleno)-1-hexene (12).

n-BuLi (1.33 mL, 1.6M, 2.13 mmol) was added dropwise over ca. 30 sec to a stirred and cooled (-20°C) suspension of methyl triphenylphosphonium bromide (777.9 mg, 2.13 mmol) in THF (20 mL). The resulting yellow solution was stirred for 20 min at 0°C, cooled to -78°C, and then added via cannula (using THF 5 mL as rinse) to a stirred and cooled (-78°C) solution of aldehyde 11 (468.0 mg, 1.94 mmol) in THF (30 mL) over ca 30 sec. The cold bath was removed and the solution was stirred for 12 h, quenched with water (5 mL), followed by 10% aqueous HCl (20 mL). The aqueous solution was extracted with CH_2Cl_2 (4 x 20 mL), and the combined organic extracts were washed with brine (1 x 20 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (2 x 18 cm), using 15% CH_2Cl_2 -hexane, gave 12 (328.7 mg, 71%) as a pure [¹H NMR (400 MHz)], pale yellow oil: FT-IR (CH₂Cl₂ cast) 3072, 3059, 2674, 2929, 2854, 1640, 1437 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.50 (pentet, J = 7.5 Hz, 2 H), 1.73 (pentet, J = 5 Hz, 2 H), 2.90 (t, J = 7.5 Hz, 2 H), 3.90 (t, J = 7.5 Hz, 3.90 (t, J = 7.5 Hz), 3.90 (t, J = 7.5 Hz, 2 H), 4.92-5.04 (m, 2 H), 5.71-5.83 (m, 1 H), 7.18-7.29 (m, 3 H), 7.42-7.50 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 27.62 (t'), 28.93 (t'), 29.52 (t'), 33.09 (t'), 114.63 (t'), 126.54 (d'), 128.90 (d'), 130.57 (s'), 132.34 (d'), 138.33 (d'); exact mass, m/z calcd for C₁₂H₁₆Se 240.0404, found 240.0417. Anal. Calcd for C₁₂H₁₆Se: C, 60.25; H, 6.74. Found: C, 60.55; H, 6.79.

5-(Phenylseleno)pentanal (11).

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cooled (-78°C) solution of selenide **12** (143.7 mg, 0.661 mmol) in CH₂Cl₂ (35 mL) until a permanent purple color was generated (ca. 5 min). Triphenylphosphine (500 mg, 1.90 mmol) was then added in 1 portion and, with the cold bath in place, the solution was stirred for 3-4 hr, by which point the solution had attained room temperature. The solution was concentrated, and flash chromatography of the residue over silica gel (2 x 20 cm), using 10% EtOAc-hexane, gave **11** (134.4 mg, 93%) as a pure [¹H NMR, (400MHz)], oil, spectroscopically identical (¹H NMR, ¹³C APT, FT-IR) to an authentic sample made by DIBAL reduction of the corresponding ester **10**.

6-(Phenylseleno)hexanal (13).

n-BuLi (9.91 mL, 1.6M, 15.85 mmol) was added to a stirred and cooled (-78° C) solution of (methoxymethyl)triphenyl hosphonium chloride (5.44 g, 15.85 mmol) in THF (30 mL) over 1 min. The resulting orange solution was stirred for 30 min at 20°C and then added via cannula (using THF 5mL as rinse) to a stirred and cooled (-78°C) solution of aldehyde 11 (1.9119 g, 7.93 mmol) in THF (50 mL). The cold bath was removed and the resulting solution was stirred for 36 h, poured into water (100 mL), and extracted with CH_2Cl_2 (2 x 50 mL). The organic extract was dried and evaporated. The resulting oil was dissolved in *p*-dioxane (50 mL) and water (7 mL) and *p*-toluenesulfonic acid (200 mg) was added. The solution was stirred for 12 h at

room temperature and then refluxed 24 h and cooled. The resulting mixture was extracted with ether (3 x 50 mL) and the organic extracts were washed with brine (1 x 20 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (4 x 20 cm), using EtOAc-hexane mixtures (3 to 6% EtOAc), gave **13** (1.2519 g, 62%) as a pure [¹H NMR, (400MHz)], pale yellow oil: FT-IR (CH₂Cl₂ cast) 2932, 2857, 2821, 2720, 1723, 1578, 1478 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.38-1.49 (m, 2 H), 1.61 (pentet, *J* = 7.5 Hz, 2 H), 2.38 (t, *J* = 7.5 Hz, 2 H), 2.91 (t, *J* = 7.5 Hz, 2 H), 7.16-7.30 (m, 3 H), 7.42-7.53 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.13 (t'), 27.13 (t'), 28.84 (t'), 29.48 (t'), 43.27 (t'), 126.35 (d'), 128.69 (d'), 130.15 (s'), 132.06 (d'), 201.84(d'); exact mass, *m/z* calcd for C₁₂H₁₆OSe 256.0366, found 256.0369. Anal. Calcd for C₁₂H₁₆OSe: C, 56.47; H, 6.32. Found: C, 56.64; H, 6.52.

7-(Phenylseleno)-1-heptene (14).

n-BuLi (1.06 mL, 1.6M, 1.69 mmol) was added dropwise over ca. 1 min to a stirred and cooled (-20°C) suspension of methyl triphenylphosphonium bromide (617.8 mg, 1.69 mmol) in THF (60 mL). The resulting yellow solution was stirred for 20 min at 0°C, cooled to -78°C, and then added via cannula over ca. 30 sec (using THF 3 mL as rinse) to a stirred and cooled (-78°C) solution of aldehyde **13** (393.2 mg, 1.54 mmol) in THF (30 mL). The cold bath was removed and the solution was stirred for **8** h, quenched with water (5 mL), followed by 10% aqueous HCl (20 mL). The aqueous solution was extracted with CH_2Cl_2 (4 x 25 mL), and the combined organic extracts washed with brine (1 x 15 mL), dried, and evaporated. Flash chromtaography of the residue over silica gel (3 x 15 cm), using 15% CH_2Cl_2 -hexane,

gave 14 (281.8 mg, 72%) as a pure [¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 3073, 3060, 2974, 2928, 1640, 1579, 1477 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.33-1.47 (m, 2 H), 1.65-1.76 (m, 2 H), 1.98-2.06 (m, 2 H), 2.89 (t, *J* = 7.5 Hz, 2 H), 4.89-5.02 (m, 2 H), 5.72-5.85 (m, 1 H), 7.17-7.29 (m, 3 H), 7.42-7.52 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 27.79 (t'), 28.30 (t'), 29.25 (t'), 29.96 (t'), 33.57 (t'), 114.41 (t'), 126.58 (d'), 128.94 (d'), 130.63 (d'), 132.38 (d'), 138.74 (d'); exact mass, *m/z* calcd for C₁₃H₁₈OSe 254.0574, found 254.0568. Anal. Calcd for C₁₃H₁₈OSe: C, 61.66; H, 7.16. Found: C, 61.78; H, 7.27.

6-(Phenylseleno)-1-hexanal (13).

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cooled (-78°C) solution of selenide 14 (174.9 mg, 0.691 mmol) in CH_2Cl_2 (30 mL) until a permanent the purple color was generated (ca. 5 min). Triphenylphosphine (1.2 g, 4.56 mmol) was then added in one portion, and with the cold bath in place, the solution was stirred for 3-4 hr at which point it had attained room temperature. The solution was concentrated, and flash chromatography of the residue over silica gel (2.5 x 19 cm), using 5% EtOAc-hexane, gave 13 (147.4 mg, 84%) as a pure [2-D TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)] oil which was spectroscopically identical (¹H NMR, ¹³C APT, FT-IR) to an authentic sample of 13 made by Wittig reaction from 11.

4-(Phenylseleno)-1-butanal (15).

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cooled (-78°C) solution of olefin 16^{22} (256.3 mg, 0.862 mmol) in CH₂Cl₂ (30 mL) until a permanent purple color was generated (ca. 7 min). Triphenylphosphine (680 mg, 2.59 mmol) was then added in one portion, and with the cold bath in place, the solution was stirred for 3-4 h at which point it had attained room temperature. The solution was concentrated, and flash chromatography of the residue over silica gel (2.5 x 18 cm), using EtOAc-hexane mixtures (5 to 8% EtOAc) gave 15 (163.2 mg, 83%) as a pure [¹H NMR (400 MHz)], oil: FT-IR (neat film) 3070, 3056, 2938, 2823, 1723, 1578, 1478, 1437 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.92-2.02 (m, including a pentet at δ 1.98, 2 H), 2.57 (dt, *J* = 7.5, 1.5 Hz, 2 H), 2.91 (t, *J* = 8.5 Hz, 2 H), 7.18-7.28 (m, 3 H), 7.41-7.50 (m, 2 H), 9.72 (t, *J* = 1.5 Hz, 1 H); exact mass, *m/z* calcd for C₁₀H₁₂OSe 228.0053, found 228.0044.

3-(Phenylseleno)-1-methylenecyclohexane (18)

n-BuLi (4.30 mL, 1.6M, 6.88 mmol) was added dropwise over ca. 30 sec to a stirred and cooled (-78°C) suspension of methyl triphenylphosphonium bromide (2.4674 g, 6.89 mmol) in THF (15 mL). The resulting yellow solution was stirred for 20 min at 0°C, cooled to -78°C, and then added via cannula over ca. (using THF 5 mL

as rinse) to a stirred and cooled (-78°C) solution of phenylseleno ketone 17^{23} (1.5853 g, 6.26 mmol) in THF (20 mL). The cold bath was removed and the solution was stirred for 10 h, quenched with water (7 mL), followed by 10% aqueous HCl (30 mL). The aqueous solution was extracted with CH₂Cl₂ (4 x 20 mL). The combined organic extracts were washed with brine (1 x 15 mL), dried, and evaporated. Flash chromtaography of the residue over silica gel (3 x 21 cm), using 15% CH₂Cl₂-hexane, gave **18** (1.1083 mg, 70%) as a pure [¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2979, 2933, 2882, 2834, 1650, 1578, 1476, 1436, 1336, 1226 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.30-1.45 (m, 1 H), 1.52-1.65 (m, 1 H), 1.75-1.88 (m, 1 H), 1.93-2.09 (m, 2 H), 2.14-2.27 (m, 2 H), 2.60 (dd, *J* = 13, 4 Hz, 1 H), 3.19-3.31 (m, 1 H), 4.62 (d, *J* = 14 Hz, 2 H), 7.18-7.28 (m, 2 H), 7.46-7.55 (m, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 27.47 (t'), 33.34 (t'), 34.28 (t'), 42.52 (t'), 43.27 (d'), 108.69 (t'), 127.38 (d'), 128.91 (d'), 128.99 (s'), 134.82 (d'); exact mass, *m/z* calcd for C₁₃H₁₆OSe 252.0417, found 252.0416. Anal. Calcd for C₁₃H₁₆OSe: C, 62.15; H, 6.42. Found: C, 62.27; H, 6.58.

3-(Phenylseleno)-1-cyclohexanone (17)

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cooled (-78°C) solution of olefin **18** (279.3 mg, 1.11 mmol) in CH_2Cl_2 (25 mL) until a permanent purple color was generated (ca. 6 min). Triphenylphosphine (1.18 g, 4.5 mmol) was then added in one portion and, with the cold bath in place, the solution was stirred for 3-4 h, at which point it had attained room temperature. The solution was concentrated, and flash chromatography of the residue over silica gel (2.5 x 19 cm),

using 5% EtOAc-hexane, gave 17 (141.4 mg, 50%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)] oil which was spectroscopically identical to an authentic sample of 17.

2-Methyl-6-(phenylseleno)-2-heptene (20).

A literature procedure²⁴ for conversion of alcohols to phenyl selenides was followed with minor modifications. *n*-Bu₃P (1.46 mL, 5.86 mmol) and PhSeCN (1.07 mg, 5.86 mmol) were sequentially added to a stirred and cooled (0°C) solution of alcohol **19**²⁵ (375.3 mg, 2.93 mmol) in THF (7 mL). The resulting solution was stirred for 4 h and then concentrated. Flash chromatography of the residue over silica gel (2.5 x 19 cm), using 3% CH₂Cl₂-hexane, gave **20** (741.8 mg, 95%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], yellow oil: FT-IR (CH₂Cl₂ cast) 3071, 2966, 2917, 2858, 1579, 1476, 1376, 1073 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.40 (d, *J* = 12 Hz, 3 H), 1.50-1.80 (m, including s at δ 1.60 and δ 1.69, 8 H), 2.05-2.20 (m, 1 H), 3.20-3.39 (m, 1 H), 5.00-5.10 (m, 1 H), 7.20-7.31 (m, 2 H), 7.47-7.61 (m, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 17.74 (q'), 22.18 (q'), 25.71 (q'), 26.38 (t'), 37.58 (t'), 39.26 (d'), 123.62 (d'), 127.25 (d'), 128.83 (d'), 129.42 (s'), 132.15 (s'), 134.89 (d'); exact mass, *m*/*z* calcd for C₁₄H₂₀OSe 268.0730, found 268.0726. Anal. Calcd for C₁₄H₂₀OSe: C, 62.91; H, 7.54. Found: C, 62.92; H, 7.74.

4-(Phenylseleno)-1-pentanal (21)

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cooled (-78°C) solution of olefin **20** (182.8 mg, 0.684 mmol) in CH₂Cl₂ (30 mL) until a permanent purple color was generated (ca. 6 min). Triphenylphosphine (900 mg, 3.42 mmol) was then added in one portion, and with the cold bath in place, the solution was stirred for 3-4 hr at which point it had attained room temperature. The solution was concentrated, and flash chromatography of the residue over silica gel (2.5 x 23 cm), using 5% EtOAc-hexane gave **21** (124.8 mg, 76%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2954, 2919, 2862, 2822, 1723, 1578, 1477, 1389, 1072 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.42 (d, *J* = 7 Hz, 3 H), 1.85-1.99 (m, 2 H), 2.63 (t, *J* = 7 Hz, 2 H), 3.21-3.31 (m, 1 H), 7.20-7.31 (m, 3 H), 7.49-7.58 (m, 2 H), 9.75 (m, *J* = 2 Hz, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 22.16 (q'), 29.50 (t'), 38.86 (q'), 42.08 (t'), 127.63 (d'), 128.52 (s'), 128.96 (d'), 135.02 (d'), 201.50 (d'); exact mass, *m/z* calcd for C₁₁H₁₄OSe 242.0210, found 242.0208. Anal. Calcd for C₁₁H₁₄OSe: C, 54.78; H, 5.85. Found: C, 54.74; H, 5.96.

Cis-7a-(2-Propenyl)hexahydro-1(3H)-isobenzofuranone (24).

Lithium diisopropylamide (LDA) was prepared by rapid additon (ca. 60 sec) of n-BuLi (18.52 mL, 1.6M in hexane, 29.63 mmol) to a magnetically stirred and cooled (0°C) solution of *i*-Pr₂NH (4.13 mL, 29.63 mmol) in THF (35 mL). The solution was then cooled to -78°C, and after an additional 15 min, a solution of the lactone 23 (2.7687, 19.76 mmol) in THF (15 mL plus 5 mL as rinse) was added by cannula over ca. 1 min. The resulting solution was stirred for 30 min, and then n-BuLi (6 mL, 1.6M, 9.60 mmol) was added and the solution was stirred for 10 min at -78°C at which point allyl bromide (2.80 mL, 32 mmol) was added neat in one portion. The cold bath was removed and stirring was continued for 8 h. Cold saturated aqueous ammonium chloride (10 mL) was added and the solution was extracted with ether (3 x 35 mL). The combined organic extracts were washed with brine (1 x 20 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (3 x 20 cm), using 5% EtOAc-hexane, gave 24 (2.8408 g, 80%) as a pure [¹H NMR (400 MHz)], pale yellow oil: FT-IR (CDCl₃ cast) 2933, 2858, 1768, 1113 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) & 1.25-1.57 (br m, 6 H), 1.63-1.82 (m, 2 H), 2.25-2.40 (m, 3 H), 3.95 (dd, J = 9.0, 5.5 Hz, 1 H), 4.25 (dd, J = 9, 6 Hz, 1 H), 5.02-5.15 (m, 2 H), 5.66-5.80 (m, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.68 (t'), 21.92 t'), 25.07 (t'), 29.29 (t'), 37.71 (d'), 38.92 (t'), 44.96 (s'), 69.21 (t'), 118.78 (t'), 132.93 (d'), 180.96 (s'); exact mass, m/z calcd for $C_{11}H_{16}O_2$ 180.1156, found 180.1149. Anal. Calcd for C₁₁H₁₆O₂: C, 73.30; H, 8.95. Found: C, 73.26; H, 8.98.

Methyl cis-1-(2-propenyl)-2-[(phenylseleno)methyl]cyclohexanecarboxylate (29).

A literature procedure for cleavage of lactones, using phenyl selenide anion,6 was followed with slight modifications: THF (5 mL) was added to a stirred mixture of PhSeSePh (1.0488 g, 3.36 mmol) and NaH (242.0 mg, 60% dispersion in oil, 6.05 mmol) and the resulting slurry was refluxed for 45 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature and dry HMPA (2.0 mL) was added. The precipitate dissolved, and a solution of lactone 24 (806.8 mg, 4.48 mmol) in THF (3 mL plus 2 mL as rinse) was added via cannula, and the mixture was refluxed for 36 h. The mixture was cooled to room temperature. quenched with methanol (8 mL), acidified (litmus red) by addition of cold hydrochloric acid (0.5M, 10 mL), and extracted with EtOAc (3 x 25 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and concentrated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 29. Evaporation of the ether and flash chromatography of the residue over silica gel (3 x 20 cm), using EtOAc-hexane mixtures (2 to 20% EtOAc), gave selenide 29 (947.5 mg, 60%) as a pure [¹H NMR, (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2934, 1772, 1210 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.25-1.43 (m, 2 H), 1.47-1.93 (m, 4H), 1.70-1.80 (m, 1 H), 1.82-1.97 (m, 2 H), 2.49 (d, J = 8.5 Hz, 2 H), 2.97 (t, J = 12 Hz, 1 H), 3.14 (dd, J = 12 Hz, 2.5 Hz, 1 H), 3.65 (s, 3 H), 4.99-5.05 (m, 2 H), 5.55-5.63 (m, 1 H), 7.20-7.30 (m, 3 H), 7.49-7.59 (m, 2 H); ¹³C NMR APT δ 22.15 (t'), 23.20 (s'), 26.35 (t'), 30.11 (t'), 40.90 (t'), 43.53 (d'), 50.61 (t'), 51.24 (q'), 118.25 (t'), 126.78 (d'), 128.92 (d'), 130.68 (s'), 132.88 (d'), 133.20 (d'), 175.91 (s'); exact mass,
m/z calcd for C₁₈H₂₄SeO₂ 352.0929. found 352.0949. Anal. Calcd for C₁₈H₂₄SeO₂: C, 61.53; H, 6.89; O, 9.11. Found: C, 61.65; H, 6.88; O, 8.93.

Methyl cis-1-(2-oxoethyl)-2-[(phenylseleno)methyl]cyclohexanecarboxylate (22).

Ozone (pre-cooled to -78 °C) was bubbled into a stirred and cooled (-78°C) solution of oletin 29 (167.4 mg, 0.476 mmol) in CH₂Cl₂ (30 mL) until a permanent purple color was generated (ca. 6 min). The solution was purged for 5 min with argon, and then triphenylphosphine (500 mg, 1.91 mmol) was added in one portion. The resulting solution was allowed to warm to room temperature with stirring with the cold bath in place (~ 4 hr). The cold bath was left in place and stirring was continued for ca. 4 h. The solution was concentrated, and flash chromatography of the residue over silica gel (2 x 27 cm), using EtOAc-hexane mixtures (2 to 18% EtOAc), gave aldehyde 22 (138.7 mg, 82%) as a pure [¹H NMR, (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2940, 1724 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.24-1.52 (m, 3 H), 1.53-1.73 (m, 4 H), 1.82-1.93 (m, 1 H), 2.04-2.12 (m, 1 H), 2.55 (dd, J = 13, 5.5 Hz, 1 H), 2.79-2.92 (m, 2 H), 3.00-3.06 (m, 1 H), 3.67 (s, 3 H), 7.20-7.30 (m, 3 H), 7.42-7.51 (m, 2 H), 9.62 (t, J = 1 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.90 (t'), 22.97 (t'), 26.29 (t'), 29.58 (t'), 31.35 (s'), 44.21 (d'), 47.72 (t'), 50.56 (t'), 51.68 (q'), 127.04 (d'), 129.03 (d'), 130.23 (s'), 132.90 (d'), 174.79 (s'), 200.11 (d'); exact mass, m/z calcd for C₁₇H₂₂O₃Se 354.0730, found 354.0742. Anal. Calcd for C₁₇H₂₂O₃: C, 57.79; H, 6.28. Found: C, 58.02; H, 6.26.

Chapter 2

trans Ring Fused Bicyclic Structures by 6-*exo*-Trigonal Radical Closure: Use of the Triethylborane-Stannane-Air System for Intramolecular Addition to Aldehydes

INTRODUCTION

The area of synthetic free radical chemistry has been reviewed on a number of occasions.¹ The majority of radical additions in the literature are those involving addition to carbon-carbon multiple bonds, but recently, radical additions to carbon-heteroatom multiple bonds have begun to gain acceptance as a useful synthetic tool. The present review section will discuss some of the recent developments in this area. A general outline of the principles of additions to carbonyl groups will be followed by a summary of the synthetic applications of this methodology.

Radical Addition to Aldehydes

Fraser-Reid and Tsang² were the first to observe that 6-*exo* free radical cyclization onto aldehydes was a useful synthetic procedure. Reaction of 1 with tributyltin hydride gave a mixture of two compounds 3 and 2 in a 1:4 ratio and in 91% combined yield.

Fraser-Reid and co-workers³ have studied the competitive reaction between 5exo cyclization onto a carbonyl group and 5-exo cyclization onto an olefin. In this experiment it was found that olefin closure product dominated by a ratio of 3:1 (eq. II-2). This is an upper limit, since the reversibility of the cyclization was not taken into account.

These results (and others by the same group, *vide infra*) have prompted mechanistic work in this area. Beckwith and co-workers⁴ have shown that the rate constant of 5-*exo* closure for radical 7 to 8 is $k_1 = 8.7 \times 10^6 \text{ s}^{-1}$ at 80 °C, while the rate constant for the reverse reaction (ring opening or fragmentation) has been found to be quite large and estimated at $k_{-1} = 4.7 \times 10^8 \text{ s}^{-1}$ at 80 °C.

Scheme II-1

The results in Scheme II-1 would seem to indicate that at lower temperature fragmentation of the alkoxy radical is less pronounced, but the bimolecular reaction of recudtion of the alkoxy radical is also effected by variations in temperature and it is not clear how this will effect the outcome of the process. The rate constants for various acceptors are listed in Scheme II-2 and they show that the rate constants for radical cyclizations onto olefins, aldehydes, and alkynes are within the useful range, whereas the rate of cyclization for 5-*exo* closure onto a nitrile is rather low and this may cause premature reduction of the initial radical before it can cyclize.

Scheme II-2

The six-membered case is slightly more complicated.⁵ The rate constant for 6-*exo* closure has been measured at $1.0 \times 10^6 \text{ s}^{-1}$ at 80 °C, while the rate constant for ring opening is only slightly faster, with a value of $1.1 \times 10^7 \text{ s}^{-1}$, also at 80 °C.

Scheme II-3

Another factor to consider in the 6-exo aldehyde cyclizations is the problem of hydrogen abstraction via a six-membered ring transition state. Beckwith has shown

that at low stannane concentration this reaction is competitive with cyclization (eq. II-3).

The stereochemistry of cyclization has also been studied⁶ for the 6-exo cyclization with aldehyde 10 (eq. II-4) and it has been established that at high stannane concentration the *trans/cis* ratio is 1.2, while at low concentration the ratio increases to 3.2. This is explained by assuming that at high stannane concentration the alkoxy radical is quenched immediately while at low stannane concentration equilibration occurs via the open chain form and the thermodynamically favored product 12 is formed preferentially. This arguement does not take Curtin-Hammet kinetics into account and also the ring opening reaction is not a favoured process.

Further work by Fraser-Reid and Walton⁷ has indeed shown that aldehydes are synthetically useful radical acceptors. In competitive studies between *exo* cyclization onto olefins and aldehydes they have observed that the 6-*exo* aldehyde cyclization is favored over both 5-*exo* and 6-*exo* olefin cyclizations (Scheme II-4).

Scheme II-4

Other examples have also been studied by the Duke University group⁸ to better understand the scope of this reaction. The first two entries in Scheme II-5 show that 6-*exo* cyclization onto the aldehyde carbon is an efficient process even though fragmentation would give a stable α -oxygen radical. The corresponding 5-*exo* cyclizations gave did not always proceed as efficiently, since fragmentation was found to be the major pathway in the case of 24.

Scheme II-5

The corresponding 7-exo cyclization and cyclization onto a ketone (Scheme II-6) were also examined. Attempted 7-exo trigonal cyclization gave only the product of reduction. Tandem cyclization of **30** did provide an interesting set of results. Three compounds were isolated from this reaction. The reduction product **31** was formed in 15% while the isomeric products **32**, derived from cyclization onto the olefin, were formed in 25%. The tandem cyclization product **33** was formed in 46% yield! This is a very interesting result since the 5-exo cyclization onto the ketone was a favoured process, but other products (**32** and **33**) were also isolated from the reaction mixture.

Scheme II-6

A synthetic application of this methodology⁹ to the synthesis of silphenene (42) is shown in Scheme II-7. The benzylidene group of 36 was opened to afford 37 and fragmentation then provided 38. Functional group manipulations gave 39 and alkylation then gave a mixture of isomers that was deprotonated and methylated to 40. Finally, deprotection and Chugaev elimination furnished 41, a compound that has been previously transformed into 42.

Not all the attempted cyclizations onto aldehydes have been successful.¹⁰ The three entries in Scheme II-8 illustrate this point. Presumably, this is due to the effect of an α -oxygen functionality (that may cause fragmentation of the formed alkoxy radical) as well as encumberance of the aldehydo group. Starting materials that gave poor results are also depicted in Scheme II-9. The authors caution workers to choose substrates for radical-aldehyde chemistry with care since differing structural features seem to drastically alter the outcome of these reactions.

Scheme II-8

Jung¹¹ has used the formyl transfer reaction to advantage in synthetic work towards cyclophellitol. Exposure of aldehyde **51** to the conditions shown in eq. II-5 gave an 84% yield of the formyl transfer product **52**, which is an intermediate for the preparation of cyclophellitol.

Knapp¹² has found that 6-*exo* cyclization of **53** gave a 63% yield of alcohols **54** in a 3:2 ratio (eq. II-6).

Addition of vinyl radicals (derived from stannylation of terminal alkynes) has also been studied (Scheme II-9).¹⁰

Scheme II-9

Other Carbonyl Acceptors

Although aldehydes have proven suitable as radical acceptors for the formation of six-membered rings there is always a constant search for the ideal acceptor that would serve well in both the 5-*exo* and 6-*exo* cyclizations. Having taken a lead from Kiyooka,¹³ Curran¹⁴ has developed a cyclization reaction onto an acyl germane that gives cyclic ketones (Scheme II-10).

Scheme II-10

The acyl germane therefore acts a radical acceptor that gives ketones directly after radical cyclization. This is synthetically equivalent to addition to an aldehyde followed by oxidation of the resulting alcohol or addition to an acetylene followed by oxidative cleavage of the resultant olerin.

Tsai and Cherung¹⁵ have found that acyl silanes also behave as suitable radical acceptors, but give the corresponding silyl ethers via a radical Brook rearrangement ($60 \rightarrow 61$) (Scheme II-11).

Scheme II-11

Formation of five membered and six-membered ring products proved to be a fairly efficient process since **62a** was isolated in 63% yield while **62b** was formed in 63% yield, both compounds being isolated as the benzoates. Secondary radicals also reacted in a similar fashion and it was found that the diphenylmethylsilyl derivative gave the highest proportion of cyclized product.¹⁶

An application of this closure to a tandem process was also examined¹⁶ and the bicyclic structure **66** was formed in 81% yield (eq. II-8).

Radical Addition to Ketones Followed by Fragmentation

The radical addition to ketones is not efficient process unless an adjacent stabilizing group is present. In this case directed fragmentation of the formed alkoxy radical now becomes possible. In most cases the radical will collapse to a ketone and undergo rearrangement or ring expansion. This type of process has been used synthetically. Although this is a fairly new area a review¹⁷ has appeared and this section will only highlight a few representative examples of these types of reactions.

The pioneering work of Beckwith¹⁸ focused on the intramolecular addition of an aryl radical to an β -ketoester to give the intermediate alkoxy radical **68**, that then underboes fragmentation to the ring expanded product **70** (Scheme II-12).

Scheme II-12

Work by Dowd and Choi¹⁹ has resulted in a general strategy for the synthesis of various types of medium sized ring compounds (Scheme II-13).

Scneme II-13

Medium sized heterocycles are also available by this technology (eq. II-9).²⁰

The radical source need not be only one carbon away, as shown in eq. II-10.21

An interesting application of this reaction is shown in Scheme II-14.²² Where attack of a vinyl radical derived from acetylene **79** onto the carbonyl group causes ring expansion to **81** which is followed by a second ring expansion to **83**; the latter finally expels stannyl radical to form **84**.

Scheme II-14

The cleavage of four-membered rings also opens the door to some interesting structures. Treatment of **85** with tributyltin hydride causes the carbon-bromine bond to be cleaved first. A primary radical is generated and it cyclizes onto the carbonyl group to give radical **86**. The chlorine atom serves to stabilize the radical thereby biasing cleavage of the cyclobutane ring as shown, to give the ring expanded product **88** (Scheme II-15).²³

Scheme II-15

This same concept has also been applied to the formation of ring expanded spiro compounds (eq. II-11).²⁴

Work by Baldwin has also involved free radical ring expansion but in his case expulsion of stannane gives a ring expanded product containing an olefin (eq. II-12).²⁵

Radical Additions to Carbon Monoxide

Very recently the area of multi-component free radical additions to carbon monoxide and other heteroatomic acceptors (*eg.* isonitrile) has begun to grow rapidly and is due to the efforts of Sonoda, Ryu and co-workers. Early work²⁶ focused on the addition of alkyl radicals to CO under fairly high pressure to give aldehydes. The high pressure was necessary in order to favour reaction of the radical with carbon monoxide and not hydrogen abstraction from the tin hydride (Scheme II-16).

Scheme II-16

The pressure required to obtain a 66% yield of 97 is 80 atm. By switching to a poorer hydrogen atom donor it was possible to obtain an 80% yield of 97 by simply using tris(trimethylsilyl)silane as the hydride source at a pressure of 30 atm (eq. II-13).²⁷

The reaction is also applicable to aromatic substrates as shown by the example depicted in eq. II-14.²⁸

Work from the same laboratories has resulted in an extension to a three component coupling terminating with addition to a Michael acceptor (Scheme II-17).²⁹

Scheme II-17

A similar three component reaction also worked well when an allylstannane was used as the radical terminator (eq. II-15).³⁰

A combination of the above two concepts finally led to the invention of a four component coupling reaction (eq. II-16).³¹

The acyl radical has also been added to olefins in an intramolecular sense to synthesize cyclic ketones (eq. II-17).³²

The field of radical addition to carbonyl groups has generated some very exciting free radical chemistry and it is certain that this area will continue to yield new and interesting chemistry.

RESULTS and DISCUSSION

At the outset of this work we had the goal of constructing 6-membered *trans* ring-fused bicyclic compounds by an alkylation-radical cyclization route. The principle behind our method rests on the observation that radical cyclization of the type shown in eq. II-18 gives exclusively or mainly the *cis* ring-fused products.³³

In order to generate trans ring-fused products the last carbon-carbon bond formed must not be a bond to a ring fusion atom. It is therefore necessary to set-up two pendants attached to a ring-one carrying a radical source and the other carrying radical acceptor-*trans* to one another.

Scheme II-18

This type of system is available by alkylation of bicyclic lactones of type 105 (Scheme II-18). The alkylation has been shown³⁴ to proceed *syn* to the existing bridgehead hydrogen. If the alkylation is carried out on the related open chain benzeneseleno ester 107 then no selectivity is observed in the alkylation step. With the radical acceptor in place all that is now required is to introduce the radical source, and the lactone is rather well suited for this task. Ring opening with sodium phenyl selenide³⁵ followed by esterification of the resulting acid with diazomethane gives the requisite radical precursor 110 (eq. II-19).

Initially we chose to examine a 6-endo closure of a radical onto an α , β unsaturated system. Previous work from these laboratories has shown that an electron withdrawing group on the olefin serves to increase the rate of 6-endo closure versus 5-exo closure to give mainly six-membered ring closure products (Scheme II-19).³⁶

Scheme II-19

Compound 119 seemed to be an ideal target to test our hypothesis. Accordingly, alkylation of the enolate derived from lactone 114^{34} (by treatment with LDA at low temperature) with bromide 115^{37} gave a 76% yield of adduct 117.

Scheme II-20

All attempts to open lactone ring of 117 to the radical precursors 119 or 120 via standard methods (PhSeNa,³⁵ BBr₃,³⁸ TMSBr, TMSI³⁹) failed to provide the requisite radical precursors and gave only complex mixtures or recovered starting material. Similar results were encountered with the corresponding sulfone 118 that was made by alkylation with bromide 116.⁴⁰

Scheme II-21

A different route was also examined in which the radical closure would involve an $S_N 2'$ type of addition⁴¹ with elimination of PhSO₂ radical and the formation of an exocyclic double bond (Scheme II-22).

Scheme II-22

The alkylation step proved problematic since only recovered lactone was isolated from the reaction mixture. This is explained by assuming that the acidity of the protons between the sulfone function and double bond was sufficient to quench the enolate before alkylation could occur.

Scheme II-23

In order to circumvent this problem, we made the sulfide 125 by alkylation with the corresponding chloride. The sulfide underwent ring opening with sodium phenyl selenide to give 126 in low yield, but radical cyclization provided only recovered starting material (Scheme II-23). It then occurred to us that it may be possible to cyclize the ring and reduce the ester function to a methyl group in a limited number of operations. Accordingly, lactone 125 was reduced to diol 127, but reaction with phenylseleno cyanate and *n*-tributylphosphine⁴² gave only the tetrahydrofuran 128 instead of the desired diselenide 129 that should have been convertable to 130 by tin hydride mediated reduction (Scheme II-24).

Scheme II-24

At this juncture it was clear that introduction of the radical precursor was troublesome. It was therefore decided that a structure of general type **131** may prove to be useful since only alkylation and the radical step would be required as the radical precursor is already in place. Our only worries were how to prepare this compound and we were not sure if the alkylation would still occur in the desired sense, syn to the bridgehead hydrogen atom.

Figure II-1

After some initial attempts,⁴³ we found that the thiolactal **133** could be prepared by analogy with procedures used in sugar chemistry. Thus, treatment of the lactal⁴⁴ with boron trifluoride etherate and thiophenol at 0°C in dichloromethane gave **133** as a single isomer in 70% yield.

Scheme II-25

Alkylation proceeded in good yield to give a single isomer which we assumed to be the one shown above in Scheme II-25. All attempts (Ph₃SnH, AIBN, benzene reflux; Ph₃SnH, Et₃B, hexane, air, RT; Ph₃SnH, AIBN, toluene reflux) to reductively cleave the sulfur-carbon bond via tin hydride methods in order to generate the requisite radical failed. Similar experiences have been encountered in these laboratories,⁴⁵ but related work by Marino⁴⁶ would seem to indicate that this reduction is indeed possible. This was not of concern since we made selenolactal **136** using analogous chemistry and alkylated it with **115**. However, exposure of the adduct **137** to radical conditions gave the product of 6-*endo* cyclization **138** as a mixture of isomers at the ester function in only 10% yield (Scheme II-26).

Changing the electron withdrawing group on the double bond to a sulfone opened the

door to some interesting results. Alkylation of 136 with bromide 116 gave an 85% yield of the adduct 139 as a single (undetermined) isomer. Exposure of 139 to standard radical conditions gave a mixture of two compounds 140 and 141 in 30% and 40% yield, respectively.

The *trans*-decalin 140 arises from a 6-endo closure onto the double bond followed by tin hydride reduction of the resulting adduct radical. Compound 141 arises from 5-exo closure onto the olefin followed by extrusion of PhSO₂ radical and concomitant olefin formation (Scheme II-27).

Scheme II-27

These results are rather surprising, since the sulfone is a strong electron withdrawing group and 5-exo closure should further be disfavored since that end of the olefin is disubstituted.^{1e} Intuitively, we changed the nature of the group from electron withdrawing to electron donating in order to have an electron rich double bond to see if this would bias the system in favour of 6-endo closure. The substrate 143 was made by alkylation with the halide 142⁴⁷ in low yield. This was in large part due to the instability of the enol ether to chromatography. Nevertheless a pure sample of 143 was exposed to thermal conditions for radical cyclization and an 83% yield of adduct 144 as a mixture of isomers was obtained (Scheme II-28).

Scheme II-28

We were quite pleased with this result since it did indeed demonstrate that 6-endo closure is favored when electron donating groups are present on the double bond, a fact not previously appreciated. We also envisioned further use for adduct 144, since it was conceivable that demethylation (or desilylation if we changed the nature of the olefin in the alkylation step) and oxidation of the resulting alcohol should furnish ketone 147. Base induced elimination would then provide α , β -unsaturated ketone 148, a compound that may prove useful for further chemistry (Scheme II-29).

To our dismay we could not repeat the initial alkylation step. We tried various conditions as well as a few different electrophiles, but only decomposed starting material was isolated.

Having been so close to success we were determined to find a system that would prove to be general for the requirements we initially outlined. It was then decided to retuirn to lactone 114 and examine the aldehyde function as a radical acceptor sinc eit has been shown to be a suitable radical acceptor. Accordingly, lactone 114 was alkylated with iodide 149⁴⁸ to give a good yield of adduct 150. Ring

opening and esterification with diazomethane then gave the selenide ester **151** without incident. Unfortunately all attempts to hydrolyze the acetal function failed (Scheme II-30).

Scheme II-30

We then turned to the dimethyl acetal 155b. It was made by alkylation of lactone 154b with iodide 153 whose preparation is analogous to that of 149 and is shown in Scheme II-31.

Scheme II-31

Ring opening gave 156b which was found to be smoothly hydrolyzed (TFA-H₂O, $CHCl_3$)⁴⁹ to aldehyde 157b in excellent yield (Scheme II-32).

Scheme II-32

Exposure of 157b to standard thermal conditions for radical generation (Ph_3SnH , AIBN, PhH reflux) gave a mixture of three compounds (Scheme II-33).

Scheme II-33

Compounds 158 and 159 may arise from reduction/fragmentation of the intermediate alkoxy radical 161. While direct reduction of the alkoxy radical gives alcohol 160.

Scheme II-34

There are two other possible pathways for the formation of 159. Direct reduction of the initially formed carbon radical 163 by tin hydride (pathway b) or abstraction of hydride via a six-membered ring transition state to give the α -carbonyl radical 164 (pathway a) that would then be reduced to furnish the product 159 (Scheme II-35).

Scheme II-35
We then turned to the borane system for generating radicals. This involves the use of triethylborane in hexane at or below room temperature in the presence of oxygen.⁵⁰ The exact mechanism of the borane method is not known but the process is believed to follow the pathway illustrated in Scheme II-36. Attack of oxygen on the boron atom causes extrusion of ethyl radical that then reacts with tin hydride to give a stannyl radical which continues the chain process (Scheme II-36).

 $Et_2B-Et + \cdot O-O \rightarrow Et \cdot + Et_2BO-O \cdot$ $Et \cdot + Ph_3SnH \longrightarrow C_2H_6 + Ph_3Sn \cdot$ Scheme II-36

Scheme II-50

When the cyclization reaction was carried out with **157b** using the borane method a good yield of the cyclized product was obtained. It was found convenient to oxidize the crude alcohols directly to the corresponding ketone **166b** as it is more easily purified (Scheme II-37).

Scheme II-37

The reaction sequence is general as can be seen from the results listed in Table II-2. The yields for the alkylation step are all good except for entry 1, in which formation of the enolate is probably disfavored due to the strain involved in the *cis* 5,5-ringfused system. Selenide ring opening proceeded as expected, the only drawback being that in some cases starting lactone was recovered.

Table II-2^a Alkylation Cylization Sequence of 157a-e

^a All yields refer to pure compounds. ^b All lactones are saturated carbocycles except for n = 1, in which case both the saturated and $\Delta^{5,6}$ unsaturated [*i.e. cis*-3a,4,7,7atetrahydro-1-(3*H*)-isobenzofuranone] compounds were studied. ^c Overall yield for 157->166. ^d Corrected for recovered starting lactone. ^e Corrected for recovered aldehyde 157a. ^f Some reduced product (*i.e.* PhSe replaced by H) is also formed: 28% yield; 31% corrected for recovered starting material (157a, n = 0).

Since the yields of 6-membered ring products were good we were curious if this process was applicable to other ring sizes. We first examined a 7-endo cyclization to see if medium sized rings were accessible by this methodology.

Scheme II-36

The requisite radical precursor 167 was made by Wittig chemistry,⁵¹ and exposure of 167 to the borane conditions gave only the product of reduction 169 along with olefin 168. Olefin 168 probably arises from a disproportionation reaction. Hydrogenolysis of 168 gave mainly 169 (Scheme II-36). Clearly, 7-membered ring formation was outside the scope of this process.

The next logical thing to do was to examine the disfavored 5-exo cyclization onto an aldehyde. The preparation of compound **170** is dealt with in Chapter 1 of this Thesis. Exposure of selenide **170** to triethyl borane conditions followed by oxidation gave a 43% of the ketone **171** (Equation II-23), while attempted cyclization under thermal conditions gave no cyclized product. This example shows that the borane method does effect cyclization in a case that does not proceed efficiently under thermal conditions.

Scheme II-37

In order to determine the upper limit of this cyclization we also attempted radical cyclization onto a ketone. Aldehyde 172, available from 155b by hydrolysis, was treated with methyllithium and the resulting alcohols oxidized to ketone 173. Ketalization to 174 was followed by ring opening with selenide that also deprotected the ketal to give a 21% yield of selenide 175 along with hydrolyzed starting material (Scheme II-37). Exposure of 175 to the borane conditions gave only the product of direct reduction 176. The aldehyde function was the upper limit as a radical acceptor, but we have not yet examined cyclization onto esters. However, attempted cyclization of nitrile 177 (available from 157b by oximation and dehydration) by the borane method gave only the product of reduction 178 and recovered starting material (eq. II-24).

Curiosity generated from our work in 6-endo cyclizations left us wondering if we could set-up a system that would allow direct competition between a 6-exo trigonal cyclization onto an aldehyde and a 6-endo trigonal cyclization onto the double bond of an α , β -unsaturated system. Compound 179 seemed perfectly suited for our needs (Figure II-2).

63

Figure II-2

It was prepared by alkylation of lactone **154b** with dichloride **180**.⁵² Conversion of the chloride into the silyl ether was followed by ring opening and esterification to provide **184**. Desilylation and oxidation then furnished **185** (Scheme II-38).

Scheme II-38

Exposure of 185 to the borane conditions for radical cyclization resulted in the formation of alcohol 186.

A possible mechanism for its formation is shown below in Scheme II-39. A fast 6endo cyclization is followed by capture of the radical 188 with tin to give the stannyl enol ether 189 which undergoes a tin $O \rightarrow C$ shift⁵³ to give 190. Triethyl borane-tin hydride mediated reduction⁵³ of the aldehyde then furnished the alcohol 191.

Scheme II-39

It seems that reduction of the aldehyde function by tin hydride and triethyl borane is a potential problem in this methodology, but obviously for aldehyde **157**, closure is much faster the carbonyl reduction. In the above case, reduction probably occurs after cyclization since at that point the molecule has little else to react with. The above example shows that in the above system, 6-endo cyclization is faster than 6-exo closure onto a carbonyl group.

There are several differences between the thermal method and the borane method. In the thermal method the reaction is conducted at 80 °C and the initiator and stannane are added slowly over ten hours to ensure that premature reduction of the initially formed selenide is minimized. When we followed the conditions outlined by Fraser-Reid⁷ for cyclization of ω -iodo-aldehydes, we obtained significant amounts of reduction/fragmentation products. In the borane method the reaction is carried out at a lower temperature (25°C) and the triphenyltin hydride and triethyl borane are added in one portion at the beginning of the experiment. We suspect that not only

does the triethyl borane act as a radical initiator, but it also has the potential to function as a Lewis acid and complex the aldehyde oxygen thereby weakening the π -bond and facilitating radical addition (Figure II-3).

Figure II-3

In order to gain more insight into the reasons of why the borane method was working so well, we decided to carry out a series of experiments and some of the results we obtained are listed in Table II-3.

^a Yields refer to isolated compounds. ^b Only a trace if any. ^c Yield over two steps (cyclization and oxidation). ^d Yield corrected for recovered starting material. ^e Oxidation carried out directly. f Experiment not tried. ^g h t-Bu-N=N-t-Bu

The first two entries serve to contrast the borane method and the thermal method. It is clear that the borane method is superior to the thermal method for radical cylization onto aldehydes. Lowering the temperature (entry iii) did not improve the yield, but little if any reduction/fragmentation was observed. However, in several of these reactions starting material was recovered. Entry iv illustrates the use of triethyl borane as a Lewis acid, in the absence of oxygen, and the yield is

67

acceptable, but some reduction product was also isolated. The use of titanium isopropoxide as a Lewis acid gave only a low yield of cyclized product (after oxidation). Two different initiators (entries vi and vii) were also examined and it seems that this did not improve the efficiency of our method. The last entry is rather interesting. Reaction with triphenyltin hydride and the use of a sunlamp as the initiator gave a 79% combined yield of alcohols. The reaction was very clean and this allowed us to fully characterize the products. The lower temperature employed may be the reason for the lack of fragmentation since cyclization is favored over fragmentation at lower temperatures due to entropic factors. The absence of an initiator is somewhat unique since hexaalkyditins are frequently used under photolysis conditions, but it would seem from this result that an initiator is not always required. This reaction is interesting and more study is required to explore the generality of this mild method of carbon-carbon bond formation.

For completeness, we needed to assign the stereochemistry of the adduct alcohols obtained from radical cyclization of compound 157b. ¹³C NMR spectroscopy was used initially since it is known that the chemical shift of the carbinol carbon of equatorial alcohols absorbs at higher ppm than axial alcohols.⁵⁴

Figure II-4

The chemical shift of the carbinol carbon for the major product from radical cyclization for both the thermal and borane method was 66.66 ppm while the minor product had a resonance at 70.80 ppm and on this basis we assigned the major product

from radical cyclization as being the axial alcohol **193** and the minor the equatorial alcohol **192** (Figure II-4). In order to confirm our assignment it was decided to resort to a chemical method. Sodium borohydride reduction of ketone **166b** in methanol at 0°C gave **192** as the major product (78%) with a small amount of **193** (4%) (eq. II-26). This corresponds to an axial delivery of hydride⁵⁵ from the bottom face of the decalin ring system. Chelation controlled delivery of hydride by the ester can be ruled out since the solvent would highly solvate the borohydride species making ester chelation highly improbable.⁵⁵

CONCLUSION

it has been shown that radical cyclization of alkyl selenides of the type 157 leads effciently to the corresponding six-membered ring alcohols by the use of the triethyl borane method. It would seem that the cyclization process is favored by carrying out the reaction at lower tempertures (below 25°C).

Figure II-5

EXPERIMENTAL

1,1-Dimethoxy-3-iodopropane (153).

The literature procedure for the corresponding ethylene ketal⁴⁸ was followed with some modifications. Freshly distilled Me₃SiCl (15.3 mL, 120 mmol) was added over 1 min to a stirred and cooled (0°C) solution of acrolein (6.7 mL, 100 mmol) and dry NaI (18 g, 120 mmol) in dry MeCN (250 mL). The resulting yellow solution was stirred for 5 min and then dry MeOH (9.72 mL, 240 mmol) was added in one portion. Stirring was continued for 5 min and the solution was then poured onto 5% saturated aqueous NaHCO₃ (100 mL) overlaid with pentane (300 mL). The mixture was shaken and bottom layer was removed and the remaining two organic phases were washed with 5% aqueous $Na_2S_2O_3$ (80 mL) and then with brine (7 x 100 mL) at which point only the top layer remained. The organic extract was dried (K₂CO₃) and evaporated. The residual oil was dissolved in pentane (20 mL) and filtered through a short column of basic alumina (3 x 8 cm), using pentane (100 mL) as eluent. The filtrate was evaporated to give 153 (13.9 g, 60%) as a pure [¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2988, 2952, 2935, 2908, 2830, 1458, 1443 cm⁻¹; ¹H NMR (400 MHz, CDCl₃) δ 2.04-2.11 (m, 2 H), 3.12 (t, J = 7 Hz, 2 H), 3.31, (s, 6 H), 4.42 (t, J = 75.5 Hz, 1 H); ¹³C NMR APT (100.6 MHz, CDCl₃) δ -0.14 (t'), 36.47 (t'), 53.51 (q'), 104.42 (d'). A suitable combustion analysis couild not be obtained.

cis-6a-(3,3-Dimetsioxypropyl)hexahydro-1-H-cyclopenta[c]furan-1-one (155a).

(Me₃Si)₂NLi was prepared by rapid addition (ca. 30 sec) of *n*-BuLi (5.67 mL, 1.6 M in hexane, 9.07 mmol) to a stirred and cooled (-78 °C) solution of bis(trimethylsily!)omine (1.91 mL, 9.07 mmol) in THF (30 mL). The mixture was stirred for 15 min and then a solution of lactone 154a (1.0402 g, 8.25 mmol) in THF (10 mL plus 2 mL as a rinse) was added by canual over 1 min. The resulting solution was stirred for 15 min, and then iodide 153 (2.50 g, 10.9 mmol) was added neat in one portion. The cooling bath was left in place and stirring was continued overnight, during which time the mixture attained room temperature. The reaction was quenched with cold saturated aqueous NH4Cl (10 mL) and extracted with Et2O (3 x 30 mL). The combined ethereal extracts were washed with brine (1 x 20 mL), dried (MgSO₄), and evaporated. Flash chromatography of the resulting yellow oil over silica gel (3 x 20 cm), using 20% Et₂O-hexane, gave 155a (0.7584 g, 40%) as a homogeneous [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)] oil: FT-IR (CDCl₃ cast) 2940, 1762, 1127 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.40-1.80 (br m, 8 H), 1.85-1.94 (m, 1 H), 2.04-2.11 (m, 1 H), 2.51-2.59 (m, 1 H), 3.24 (s, 3 H), 3.26 (s, 3 H), 3.85 (dd, J = 10, 3.5 Hz, 1 H), 4.24-4.35 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) & 25.19 (t'), 28.64 (t'), 31.16 (t'), 34.32 (t'), 37.92 (t'), 43.37 (d'), 52.68 (q'), 53.09 (q'), 54.75 (s'), 72.64 (t'), 104.16 (d'), 182.34 (s'); exact mass, m/z calcd for $C_{12}H_{20}O_4$ [(M - H⁺)⁺] 227.1283, found 227.1281. Anal. Calcd for $C_{12}H_{20}O_4$: C, 63.13; H, 8.83. Found: C, 62.99; H, 9.09.

Methyl cis-1-(3,3-dimethoxypropyl)-2-[(phenylseleno)methyl]cyclopentanecarboxylate (156a).

A literature procedure³⁵ for cleavage of lactones using phenyl selenide anion was followed with slight modifications: THF (6 mL) was added to a mixture of PhSeSePh (702.3 mg, 2.25 mmol) and NaH (162.0 mg, 60% dispersion in oil, 14.16 mmol) and the resulting slurry was refluxed for 30 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature, and dry, degassed HMPA (1.0 mL) was added. The precipitate dissolved, and a solution of lactone 155a (684.3 mg, 3.00 mmol) in THF (10 mL plus 3 mL as a rinse) was added via cannula, and the mixture was refluxed for 10 h. It was cooled to room temperature, quenched with MeOH (3 mL), acidified (litmus red) by addition of cold (4°C) HCl (0.5M, 10 mL), and extracted with EtOAc (3 x 30 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and evaporated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 156a. Evaporation of the Et₂O and flash chromatography of the crude product over silica gel (3 x 23 cm), using EtOAc-hexane mixtures (6 to 30% EtOAc), gave unreacted lactone 155a (256.1 mg, 37%), and then selenide 156a (467.5 mg, 39%, 62% corrected for recovered 155a) as a homogeneous [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)] yellow oil: FT-IR (CHCl₃ cast) 2949, 1724, 1128 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.22-1.32 (m, 1 H), 1.43-1.69 (br m, 5 H), 1.78-1.89 (m, 1 H), 1.95-2.11 (m. 3 H), 2.22-2.30 (m, 1 H), 2.56 (t, J = 12 Hz, 1 H), 3.15 (dd, J = 12, 3.15 Hz, 1 H), 3.28 (s, 3 H), 3.30 (s, 3 H), 3.68 (s, 3 H), 4.32 (t, J = 6 Hz, 1 H), 7.20-7.29 (m, 3 H), 7.44-7.49

(m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.91 (t'), 28.74 (t'), 29.63 (t'), 31.24 (t'), 32.55 (t'), 33.80 (t'), 50.89 (d'), 51.36 (q'), 52 17 (q'), 52.78 (q'), 57.09 (t'), 104.28 (d'), 126.65 (d'), 128.96 (d'), 130.51 (s'), 132.22 (d'), 175.54 (s'); exact mass, *m/z* calcd for C₁₉H₂₈O₄Se 400.1153, found 400.1152. Anal. Calcd for C₁₉H₂₈O₄Se: C, 57.14; H, 7.07. Found: C, 57.07; H, 6.94.

Methyl cis-1-(3-oxopropyl)-2-[(phenylseleno)methyl]cyclopentanecarboxylate (157a).

A literature procedure⁴⁹ for cleavage of dimethyl acetals was followed with minor modifications: An aqueous solution of TFA (50%, 30 mL) was added to a solution of acetal **156a** (437.5 mg, 1.10 mmol) in CHCl₃ (40 mL) and the resulting heterogeneous mixture was stirred vigorously for 12 h at room temperature. The mixture was then cooled in an ice bath and **carefully** titrated (stirring) with saturated aqueous NaHCO₃ solution until gas evolution ceased. The organic phase was separated and the aqueous layer was extracted with CH₂Cl₂ (4 x 20 mL). The combined organic extracts were washed with saturated aqueous NaHCO₃ (1 x 20 nL), brine (1 x 10 mL), dried, and concentrated. Flash chromatography of the resulting yellow oil over silica gel (2 x 18 cm), using 10% EtOAc-hexane, gave aldehyde **157a** (339.2 mg, 87%) as a pure [¹H NMR, (400 MHz)], pale yellow oil: FT-IR (CH₂Cl₂ cast) 2950, 1478, 1722 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) & 1.43-1.70 (br m, 4 H), 1.80-1.90 (m, 1 H), 1.99-2.14 (m, 2 H), 2.33-2.43 (m, 2 H), 3.11 (dd, *J* = 12, 3 Hz, 1 H), 3.68 (s, 3 H), 7.20-7.30 (m, 3 H), 7.45-7.50 (m, 2 H), 9.71 (t, *J* = 1.5 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) & 22.06 (t'), 29.45 (t'), 29.68 (t'), 31.42 (s'), 34.11 (t'), 40.6⁴ (t'), 50.96 (d'), 51.54 (q'), 56.57 (t'), 126.85 (d'), 129.03 (d'), 130.25 (s'), 132.42 (d'), 175.24 (s'), 201.36 (d'); exact mass, *m/z* calcd for $C_{17}H_{22}O_3Se$ 354.0734, found 354.0727. Anal. Calcd for $C_{17}H_{22}O_3Se$: C, 57.79; H, 6.28. Found: C, 58.13; H, 6.12.

Methyl *cis*-2-methyl-1-(3-oxopropyl)cyclopentanecarboxylate (194), Methyl (3ax, 7a β)-octahydro-6 α -hydroxy-3aH-indene-3a-carboxylate (195), and Methyl (3a α , 7a β)-octahydro-6 β -hydroxy-3aH-indene-3a-carboxylate (196).

Ph₃SnH (442.3 mg, 1.26 mmol) in hexane (4 mL plus 1 mL rinse) and Et₃B (1M solution in hexane, 2.0 mL, 2.0 mmol) were added simultaneously to a solution of aldehyde **157a** (144.1 mg, 0.401 mmol) in hexane (80 mL) over 15 sec. Air (20 mL) was then bubbled though the solution over 30 sec and stirring, without protection from the atmosphere, was continued for 4 h. At this point the reaction was still incomplete (TLC control, silica, 30% EtOAc-hexane). Ph₃SnH (50.0 mg, 0.142 mmol) in hexane (3 mL plus 1 mL rinse) and Et₃B (1 M solution in hexane, 0.88 mL, 0.88 mmol) were added, and stirring was continued for 8 h. Evaporation of the reaction mixture and flash chromatography of the crude product over silica gel (2 x 20 cm), using EtOAc-hexane mixtures (10 to 30% EtOAc), gave unreacted selenide **157a** (15.2 mg, 10.5%), reduced starting material **194** (22.2 mg, 28%, 31% corrected for recovered starting material) as a pure [¹H NMR (400 MHz)], clear oil and the epimeric alcohols **195** and **196** which were directly oxidized to ketone **166a** without characterization. Compound **194** had: FT-IR (CH₂Cl₂ cast) 2954, 2873, 1723, 1451

cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.85 (d, J = 6.8 Hz, 3 H), 1.30-1.45 (m, 2 H), 1.48-1.63 (m, 2 H), 1.72-1.86 (m 3 H), 2.11-2.24 (m, 2 H), 2.32-2.45 (m, 2 H), 3.61 (s, 3 H),⁴⁹9.71 (t, J = 1.5 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 15.93 (q'), 22.49 (t'), 29.85 (t'), 33.21 (t'), 33.40 (t'), 41.01 (t'), 45.53 (d'), 51.16 (q'), 56.32 (s'), 175.91 (s'), 201.88 (d'); exact mass, *m/z* calcd for C₁₁H₁₈O₃ 198.1256, found 198.1243.

Methyl (3aα, 7aβ)-octabydro-6-oxo-3aH-indene-3a-carboxylate (166a).

PCC (260.0 mg, 1.20 mmol) and crushed 4Å molecular sieves (100 mg) were added to a solution of alcohols **195** and **196** in CH₂Cl₂ (15 mL). The mixture was stirred at room temperature under argon for 10 h, then filtered through a pad of Celite:MgSO₄::4:1 (1 x 8 cm), using CH₂Cl₂ (70 mL), and the eluent was evaporated. Flash chromatography of the crude product over silica gel (2 x 16 cm), using EtOAchexane mixtures (7 to 20% EtOAc), gave ke⁻ one **166a** (45.4 mg, 58% from **157a**, 64% based on recovered selenide **157a**) as a pure [TLC silica, 30% EtOAc-hexane, ¹H NMR, (400 MHz)], clear oil: FT-IR (CH₂Cl₂ cast) 2953, 2874, 1713, 1219 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.35-1.45 (m, 1 H), 1.46-1.59 (m, 1 H), 1.53-1.93 (m, 5 H), 2.05-2.66 (m, 1 H), 2.25-2.52 (m, 4 H), 2.68-2.77 (m, 1 H), 3.66 (s, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 22.56 (t'), 22.75 (t'). 5.11 (t'), 35.96 (t'), 38.50 (t'), 42.87 (t'), 48.68 (d'), 51.56 (q'), 52.59 (s'), 175.33 (s'), 210.92 (s'); exact mass, *m/z* calcd for C₁₁H₁₆O₃ 196.1099, found 196.1097. Methyl *cis*-1-(3,3-dimethoxypropyl)-2-[(phenylseleno)methyl]-3-cyclohexenecarboxylate (156c).

A literature procedure³⁵ for the cleavage of lactones using phenyl selenide anion was followed with slight modifications: THF (6 mL) was added to a mixture of PhSeSePh (849.0 mg, 3.63 mmol) and NaH (196.0 mg, 60% dispersion in oil, 4.90 mmol) and the resulting slurry was refluxed for 60 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature, and dry, degassed HMPA (1.0 mL) was added. The precipitate dissolved, and a solution of lactone 155c (873.6 mg, 3.63 mmol) in THF (5 mL plus 2 mL as a rinse) was added by cannula, and the mixture was refluxed for 18 h. It then was cooled to room temperature, quenched with MeOH (2 mL), acidified (litmus red) by addition of cold (0°C) HCl (0.5M, 7 mL), and extracted with EtOAc (3 x 25 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and concentrated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 156c. Evaporation of the Et₂O and flash chromatography of the crude product over silica gel (4 x 21 cm), using 6% EtOAc-hexane, gave selenide 156c (926.4 mg, 62%) as a pure [¹H NMR, (40C MHz)], oil: FT-IR (CH₂Cl₂ cast) 2947, 1728, 1200 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.29-1.40 (m, 1 H), 1.52-1.70 (m, 3 H), 2.00-2.10 (m, 1 H), 2.19-2.45 (m, 4 H), 2.74 (t, J = 12 Hz, 1 H), 2.80-2.86 (m, 1 H), 3.28 (s, 3 H), 3.29 (s, 3 H), 3.60 (s, 3 H), 4.28 (t, J = 5 Hz, 1 H), 5.54-5.65 (m, 2 H), 7.22-7.31 (m, 2 H), 7.22-7.31 (m, 3 H), 7.22-7.313 H), 7.47-7.55 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 25.91 (t'), 27.26 (t'), 27.38 (t'), 30.08 (t'), 30.41, (t'), 39.25 (d'), 48.43 (s'), 51.55 (q'), 52.47 (q'), 52.65 (q'),

Methyl (4a α , 8a β)-1,2,3,4,4a,5,8,8a-octahydro-2 β -hydroxynaphthalcne-4acarboxylate (197) and Methyl (4a α , 8a β)-1,2,3,4,4a,5,8,8a-octahydro-2 α hydroxynaphthalene-4a-carboxylate (198)

Ph₃SnH (160.0 mg, 0.452 mmol) in hexane (4 mL plus 1 mL rinse) and Et_3B (0.76 mL, 1M in hexane, 0.76 mmol) were added simultaneously to a solution of aldehyde **157c** (127.0 mg, 0.348 mmol) in hexane (70 mL) over 20 sec. Air (10 mL) was then bubbled though the solution over 20 sec and stirring, without protection from the atmosphere, was continued for 12 h. At this point the reaction was still incomplete (TLC control, silica, 30% EtOAc-hexane). Ph₃SnH (50.0 mg, 0.142 mmol) in hexane (3 mL plus 1 mL rinse) and Et_3B (1M solution in hexane, 0.76 mL, 0.76 mmol) were added and stirring was continued for 10 h. The reaction mixture was evaporated and flash chromatography of the crude product over silica gel (2 x 20 cm), using 10% EtOAc-hexane, gave the isomeric alcohols **197** and **198**, which were not characterized, but directly oxidized to ketone **166c**, as described in the following experiment.

LDA was prepared by rapid additon (ca. 60 sec) of n-BuLi (6.90 mL, 1.6M in hexane, 11.0 mmol) to a magnetically stirred and cooled (ice-bath) solution of i-Pr₂NH (1.54 mL, 11.0 mmol) in THF (40 mL). The solution was then cooled to -78°C and, after an additional 10 min, a solution of lactone 154e (1.6797 g, 9.98 mmol) in THF (10 mL plus 3 mL as a rinse) was added by cannula over 1 min. The resulting solution was stirred for 30 min and then n-BuLi (2.00 mL, 1.6M in hexane, 3.2 mmol) was added. The solution was stirred for 10 min at -78°C at which point freshly prepared iodide 153 (3.00 g, 13.04 mmol) was added neat in one portion. The cold bath was removed and stirring was continued for 19 h. The reaction was quenched with cold saturated aqueous NH₄Cl (10 mL) and extracted with Et₂O (3 x 20 mL). The combined ethereal extracts were washed with brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the crude product over silica gel gave 155e (1.6955 g, 63%) which contained traces [¹H NMR (200 MHz)] of an impurity, amounting to <3% on the basis that it is the tranbs isoemr. The material had: FT-IR (CHCl₃ cast) 2928, 2856, 1763, 1467, 1203 cm⁻¹; ¹H NMR (CDCl₃, 400 MHZ) δ 1.06-1.51 (m, 3 H), 1.52-1.96 (br m, 13 H), 2.05-2.13 (m, 1 H), 3.25 (s, 3 H), 3.28 (s, 3 H), 3.84 (d, J = 9 Hz, 1 H), 4.21-4.29 (m, 1 H), 4.45 (dd, J = 10, 8 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 23.33 (t'), 24.24 (t'), 24.86 (t'), 25.59 (t'), 26.99 (t'), 27.94 (t'), 30.74 (t'), 32.45 (t'), 47.21 (d'), 47.95 (s'), 52.92 (q'), 52.98 (q'), 75.07 (t'), 104.36 (d'), 180.53 (s'); exact mass, m/z calcd for $C_{15}H_{26}O_4$ [(M-H)]⁺ 269.1753, found 269.1766. An analytical sample was obtained by recrystallization from hexane: 58-59 °C. Anal. Calcd for C₁₅H₂₆O₄: C, 66.63; H, 9.69. Found: C, 66.42; H, 9.54.

Methyl cis-1-(3,3-dimethoxypropyl)-2-[(phenylseleno)methyl]cyclooctanecarboxylate (156e).

A literature procedure³⁵ for cleavage of lactones using phenyl selenide anion was followed with slight modifications: THF (10 mL) was added to a mixture of PhSeSePh (658.6 mg, 2.11 mmol) and NaH (151.6 mg, 60% dispersion in oil, 3.79 mmol) and the resulting slurry was refluxed for 60 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature, and dry, degassed HMPA (0.5 mL) was added. The precipitate dissolved, and a solution of lactone 155e (760.9 mg, 2.81 mmol) in THF (8 mL plus 2 mL as a rinse) was added by cannula, and the mixture was refluxed for 24 h. It was then cooled to room temperature, quenched with MeOHI (4 mL), acidified (litmus red) by addition of cold (0°C) HCl (0.5M, 10 mL), and extracted with EtOAc (3 x 20 mL). The combined organic extracts were washed with brine (1 x 10mL), dried, and evaporated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 156e. Flash chromatography of the crude product over silica gel (4 x 20 cm), using 10% EtOAchexane, gave unreacted lactone 155e [¹H NMR, (400 MHz)] (198.6 mg, 26%) and selenide 156e (557.9 mg, 45%, 61% based on recovered starting material) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR, (400 MHz)], yellow oil: FT-IF. (CHCl₃ cast) 2924, 1723, 1476, 1437 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.12-1.70 (br m, 13 H), 1.70-1.82 (m, 2 H), 1.90-2.03 (m, 2 H), 3.30 (s, 3 H), 3.31 (s, 3 H), 3.63 (s, 3 H), 4.31 (t, J = 6 Hz, 1 H), 7.20-7.28 (m, 3 H), 7.48-7.52 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) & 22.98 (t'), 25.93 (t'), 26.89 (t'), 27.51 (t'), 28.15 (t'), 29.00 (t'),

30.16 (t'), 30.31 (t'), 33.96 (t'), 44.88 (d'), 51.32 (q'), 52.13 (s'), 52.22 (q'), 53.06 (q'), 104.78 (d'), 126.94 (d'), 128.98 (d'), 130.31 (s'), 135.15 (d'), 175.62 (s'); exact mass, *m/z* calcd for $C_{22}H_{34}O_4Se$ 442.1622, found 442.1610. Anal. Calcd for $C_{22}H_{34}O_4Se$: C, 59.85; H, 7.76. Found: C, 59.74; H, 7.85.

Methyl *cis*-1-(3-oxopropyl)-2-[(phenylseleno)methyl]cyclooctanecarboxylate (157e).

 Λ literature procedure⁴⁹ for cleavage of dimethyl acetals was followed with minor modifications: An aqueous solution of TFA (50%, 25 mL) was added to a solution of acetal 156e (550.0 mg, 0.25 mmol) in CHCl₃ (40 mL) and the resulting heterogeneous mixture was stirred vigorously for 10 h at room temperature. The resulting mixture was cooled in an ice bath and carefully titrated (stirring) with saturated aqueous NaHCO3 solution until gas evolution ceased. The organic phase was separated and the aqueous layer was extracted with CH_2Cl_2 (4 x 25 mL). The combined organic extracts were washed with saturated aqueous NaHCO₃ (2 x 20 mL), brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the crude product over silica gel (3 x 18 cm), using 10% EtOAc-hexane, gave aldehyde 157e as a pure [¹H NMR, (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2919, 1722, 1476, 1436, 1203 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.15-1.82 (br m, 12 H), 1.93-2.05 (m, 1 H), 2.18-2.35 (m, 4 H), 2.38-2.49 (m, 1 H), 3.25 (dd, J = 12, 1.5 Hz, 1 H), 3.62 (s, 3 H), 7.29-7.30 (m, 3 H), 7.42-7.53 (m, 2 H), 9.69 (t, J = 1.5 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 23.06 (t'), 25.87 (t'), 26.51 (t'), 27.47 (t'), 30.08 (t'), 30.32 (t'), 33.83 (t'), 39.87 (t'), 44.96 (d'), 51.36 (q'), 51.59 (s'), 127.12 (d'), 128.99 (d'), 129.85

Methyl (4aα, 10aβ)-dodecahydro-2α-hydroxy-4aH-cyclohexacyclooctane-4acarboxylate (201) and Methyl (4aα, 10aβ)-dodecahydro-2β-hydroxy-4aHcyclohexacyclooctane-4a-carboxylate (202).

Ph₃SnH in hexane (6 mL plus 2 mL rinse) and Et₃B (1.0 mL, 1M in hexane, 1.0 mmol) were added simultaneously over 15 sec to a stirred solution of aldehyde **157e** (144.1 mg, 0.401 mmol) in hexane (50 mL). Air (20 mL) was then bubbled though the solution over 30 sec and stirring, without protection from the atmosphere, was continued. After the material had been stirred for 6 h at room temperature, open to the atmosphere, the reaction was still incomplete (TLC control, silica, 30% EtOAchexane). Ph₃SnH (50.0 mg, 0.142 mmol) in hexane (3 mL plus 1 mL rinse) and Et₃B (0.76 mL, 1M in hexane, 0.76 mmol) were added and stirring was continued for 12 h. The mixture was evaporated and flash chromatography of the residue over silica gel (2 x 20 cm), using 10% EtOAc-hexane, gave the isomeric alcohols **201** and **202**, which were not characterized, but oxidized directly to ketone **166e**, as described in the following experiment.

Methyl (4aα, 10aβ)-Dodecahydro-2-oxo-4aH-cyclooctan-4a-carboxylate (166e)

PCC (290.0 mg, 1.33 mmol) and powdered 4 Å molecular sieves (120 mg) were added to a solution of the above alcohols **201** and **202** CH₂Cl₂ (20 mL) The resulting solution was stirred under argon for 9 h and filtered through Celite (3 x 10) cm. The pad was washed with CH₂Cl₂ (20 mL) and the combined filtrates were evaporated. Flash chromatography of the crude product over silica gel (2 x 20 cm), using 8% EtOAc-hexane, gave ketone **166e** (819.0 mg, 77%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2923, 1719, 1196 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.22-1.32 (br m, 11 H), 1.93-2.20 (m, 5 H), 2.21-2.31 (m, 1 H), 2.39 (dt, *J* = 15, 6.0 Hz, 1 H), 2.66 (t, *J* = 14 Hz, 1 H), 3.70 (s, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 22.46 (t'), 25.40 (t'), 26.45 (t'), 28.61 (t'), 32.50 (t'), 35.53 (t'), 38.57 (t'), 39.56 (d'), 46.83 (t'), 49.40 (s'), 51.47 (q'), 175.84 (s'), 211.23 (s'); exact mass, *m/z* calcd for C₁₄H₂₂O₃ 238.1568, found 238.1570. Anal. Calcd for C₁₄H₂₂O₃: C, 70.55; H, 9.31. Found: C, 70.27; H, 9.59.

Methyl *cis*-1-(4-oxobutyl)-2-[(phenylseleno)methyl]cyclohexanecarboxylate (167).

n-BuLi (0.56 mL, 1.6M, 0.898 mmol) was added to a stirred and cold (-78°C) and stirred solution of (methoxymethyl)triphenylphosphonium chloride⁵¹ (307.9 mg, 0.898 mmol) in THF (10 mL) over 30 s. The resulting orange solution was stirred for 30 min at 20°C and then added by cannula (using THF 5mL as a rinse) to a stirred solution (20°C) of aldehyde 157b (165.0 mg, 0.449 mmol) in THF (10 mL). The resulting solution was stirred for 8 h, poured into water (100 mL), and extracted with CH_2Cl_2 (2 x 50 mL). The organic extract was dried and evaporated. The resulting oil was dissolved in p-dioxane (11 mL) and water (7 mL) and p-toluenesulfonic acid (20 mg) were added. The mixture was stirredat room temperature for 12 h and then refluxed for 15 h. The mixture was then cooled, and extracted with EtOAc (3 x 15 mL). The organic extracts were washed with brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the crude product over silica gel (2 x 20 cm), using EtOAc-hexane mixtures (7 to 15% EtOAc), gave 167 (119.6 mg, 70%) as a pure [¹H NMR, (400MHz)], pale yellow oil: FT-IR (CH₂Cl₂ cast) 2942, 2935, 2931, 2860, 1722, 1477, 1448, 1436, 1285 cm⁻¹; ¹H NMR (CDCl₃, 200 MHz) δ 1.15-2.00 (br m, 13 H), 2.25-2.40 (m, 2 H), 2.83-3.10 (m, 2 H), 3.59 (s, 3 H), 7.15-7.30 (m, 3 H), 7.41-7.55 (m, 2 H), 9.68 (t, J = 1.5 Hz, 1 H); ¹³C NMR APT (CDCl₃, 50 MHz) δ 16.77 (t'), 22.32 (t'), 23.25 (t'), 26.51 (t'), 29.85 (t'), 30.33 (t'), 36.06 (t'), 44.00 (t'), 44.08 (d'), 50.55 (s'), 51.36 (q'), 127.00 (d'), 129.02 (d'), 130.79 (s'), 133.21 (d'), 176.25 (s'), 201.68(d'); exact mass, m/z calcd for C₁₉H₂₆O₃Se 382.1049, found 382.1050. Methyl trans-octahydro-2-oxo-3aH-indene-3a-carboxylate (171).

Ph₃SnH (206 mg, 0.586 mmol) in hexane (7 mL plus 2 mL rinse) and Et₃B (0.90 mL, 1M in hexane 0.9 mmol) were added simultaneously over 40 sec to a solution of aldehyde 170 (138 mg, 0.391 mmol) in hexane (90 mL. Air (20 mL) was then bubbled though the solution over 30 sec and stirring, w thout protection from the atmosphere, was continued for 7 h. At this point the reaction was still incomplete (TLC control, silica, 30% EtOAc-hexane). Ph₃SnH (50.0 mg, 0.142 mmol) in hexane (3 mL plus 1 mL rinse) and Et₃B (1 M solution in hexane, 1.0 mL, 1.0 mmol) were added, and stirring was continued for 12 h. The solution was evaporated and flash chomatograpy of the crude product over silica gel (2 x 20 cm), using 10% EtOAchexane gave a mixture of isomeric alcohols which were oxidized directly as follows: PCC (150 mg, 0.696 mmol) and powdered 4Å molecular sieves (50 mg) were added in one portion to a stirred solution of the above alcohols in CH_2Cl_2 (15 mL) and the resulting mixture was stirred vigorously at room temperature for 12 h. The mixture was then filtered though a pad of Celite (2 x 10 cm), using CH_2Cl_2 (60 mL) as eluent, and the dark brown filtrate was evaporated. Flash chromatography of the crude product over silica gel (2 x 24 cm), using 5% EtOAc-hexane, gave ketone 171 as a pure [¹H NMR, (200 MHz)], oil whose spectral proerties ¹H NMR (200 MHz), ¹³C NMR APT (50 MHz) matched those of an authentic sample prepared by a different route.³⁴ Anal. Calcd for C₁₁H₁₆O₃: C, 67.32; H, 8.22. Found: C, 67.63; H, 8.26.

cis-7a-(3-Oxopropyl)hexahydro-1(3H)-isobenzofuranone (172).

A literature procedure⁴⁹ for cleavage of dimethyl acetals was followed with minor modifications: An aqueous solution of TFA (50%, 20 mL) was added to a stirred solution of the acetal 155b (917.6 mg, 3.79 mmol) in CHCl₃ (40 mL) and the resulting heterogeneous mixture was stirred vigorously for 16 h at room temperature. The resulting mixture was cooled in an ice bath and carefully titrated (stirring) with saturated aqueous NaHCO3 solution until gas evolution ceased. The organic phase was separated and the aqueous layer was extracted with CH_2Cl_2 (4 x 35 mL). The combined organic extracts were washed with saturated aqueous NaHCO₃ (2 x 20 mL), brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the crude product over silica gel (4 x 18 cm), using EtOAc-hexane mixtures (15 to 30%), gave 172 (623.8 mg, 84%) as a homogeneous [¹H NMR, (400 MHz)], yellow oil: FT-IR (CDCl₃ cast) 2933, 2859, 1764, 1722, 1112, 1079 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.23-1.49 (m, 4 H), 1.49-1.52 (m, 2 H), 1.64-1.72 (m, 3 H), 1.93-2.01 (m, 1 H), 2.16-2.20 (m, 1 H), 2.45-2.55 (dt, J = 7.5, 1 Hz, 2 H), 3.88-3.95 (dd, J = 9, 6.5 Hz, 1 H), 4.22-4.28 (dt, J = 9, 6.5 Hz, 1 H), 9.71 (t, J = 9.71 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.51 (t'), 21.87 (t'), 24.97 (t'), 26.03 (t'), 29.02 (t'), 38.50 (t'), 39.1 (d'), 43.99 (s'), 69.20 (t'), 179.87 (s'), 200.92 (d'); exact mass, m/z calcd for $C_{11}H_{16}O_3$ [(M + H)⁺] 197.1174, found 197.1179. Methyl *cis*-1-(3-oxobutyl)-2-[(phenylseleno)methyl]cyclohexanecarboxylate (175).

A literature procedure³⁵ for the cleavage of lactones using phenyl selenide anion was followed with slight modifications: THF (8 mL) was added to a mixture of PhSeSePh (265.3 mg, 0.85 mmol) and NaH (61.2 mg, 60% dispersion in oil, 0.53 mmol) and the resulting slurry was refluxed for 50 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature and dry,

degassed HMPA (1.0 mL) was added. The precipitate dissolved, and a solution of ketal 174 (289.4 mg, 1.13 mmol) in THF (4 mL plus 3 mL as a rinse) was added via cannula, and the mixture was refluxed for 18 h. The mixture was cooled to room temperature, quenched with MeOH (3 mL), acidified (litmus red) by addition of cold (0°C) HCl (0.5M, 8 mL), and extracted with EtOAc (3 x 25 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and concentrated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 175. Evaporation of the solvent and flash chromatography of the residue over silica gel (3 x 30 cm), using EtOAc-hexane mixtures (20 to 30% EtOAc), gave recovered ketone 173 (160.4 mg, 69%) as a pure [¹H NMR (400 MHz)], oil and selenide 175 (91.4 mg, 21%, 65% based on recovered 173) as a pure [¹H NMR (400 MHz)], oil: FT-IR (CDCl₃ cast) 2936, 1720 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.25-1.49 (m, 2 H), 1.48-1.63 (m, 4H), 1.70-1.80 (m, 1 H), 1.84-2.02 (m, 4 H), 2.11 (s, 3 H), 2.14-2.33 (m, 2 H), 2.95 (t, J = 13 Hz, 1 H), 3.08 (dd, J = 13, 2 Hz, 1 H), 3.65 (s, 1 H), 7.23-7.32 (m, 3 H), 7.50-7.55 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 22.10 (t'), 22.98 (d'), 26.15 (t'), 29.69 (t'), 29.97 (q'), 30.13 (t'), 38.12 (t'), 43.80 (d'), 49.60 (t'), 51.40 (q'), 176.05 (s'), 207.69 (s'); exact mass, m/z calcd for C₁₉H₂₆O₃Se 382.1035, found 382.1054. Anal. Calcd for C₁₉H₂₆O₃Se: C, 59.84; H, 6.87. Found: C, 59.79; H, 6.86.

Ph₃SnH (126 mg, 0.359 mmol) and Et₃B (0.53 mL, 1.0 M hexane solution, 0.526 mmol) were added simultaneously, each in one portion, to a solution of the selenide 175 (91.0 mg, 0.239 mmol) in hexane (45 mL) ans stirring, without protection from the atmpshere, At this time the reaction was still incomplete (TLC silica, 30% EtOAc-hexane). Ph₃SnH (50 mg, 0.14 mmol) and Et₃B (0.50 mL, 1.0 M hexane solution, 0.50 mmol) were added and the resulting mixture was stirred for an additional 12 h. Evaporation of the solvent and flash chromatography of the crude product over silica gel (1 x 30 cm), using 5% EtOAc-hexane gave recovered selenide 175 (16.1 mg, 18%) as a pure [¹H NMR (400 MHz)], oil and the product of reduction (176) (38.8 mg, 72%, 87% based on recovered 175) as a homogeneous [¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2935, 1721 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.91 (d, J = 7 Hz, 3 H), 1.10-2.01 (br m, 12 H), 2.1 (s, 3 H), 2.19-2.48 (m, 1 H), 3.64 (s, 3 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 16.52 (q'), 21.87 (t'), 22.37 (t'), 28.07 (s'), 29.42 (t'), 29.77 (t'), 29.93 (q'), 37.59 (q'), 38.91 (t'), 48.66 (t'), 51.17 (q'), 176.72 (s'), 208.23 (s'); exact mass, m/z calcd for C₁₃H₂₂O₃ 226.1563, found 226.1570. Anal. Calcd for C₁₃H₂₂O₃: C, 68.99; H, 9.80. Found: C, 68.69; H, 10.02.

cis-7a-(2-Chloromethyl-2-propenyl)hexahydro-1(3H)-isobenzofuranone (181).

LDA was prepared by addition (*ca* 60 sec) of *n*-BuLi (10.7 mL, 1.6M in hexane, 17.13 mmol) to a magnetically stirred and cooled (ice-bath) solution of *i*- Pr_2NH (2.40 mL, 17.13 mmol) in THF (40 mL). The solution was then cooled to -78 °C and, after an additional 10 min, a solution of lactone **154b** (2.1835 g, 15.58 mmol)

in THF (11 mL plus 5 mL as a rinse) was added via cannula over 30 sec. The resulting yellow solution was stirred for 10 min, and then n-BuLi (4 mL, 1.6M in hexane, 6.4 mmol) was added in one portion. Stirring was continued for an additional 5 min and then the dichloride 180 (6.0 mL, 51.84 mmol) was added neat in one portion. The cooling bath was left in place and stirring was continued overnight, during which time the mixture attained room temperature and turned an orange color. The mixture was poured into 5% aqueous HCl (30 mL) and extracted with ether (3 x 40 mL). The combined organic extracts were washed with brine (1 x 30 mL), dried, and evaporated. Flash chromatography of the crude product over silica gel (4 x 20 cm), using 10% EtOAc-hexane, gave 181 (3.1407 g, 88%) as a homogeneous [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], yellow oil: FT-IR (CH₂Cl₂ cast) 2934, 2860, 1766, 1450, 1214 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.40-1.53 (m, 6 H), 1.62-1.82 (m, 2 H), 2.37-2.96 (m, 1 H), 2.55 (dd, J = 27, 9 Hz, 2 H), 3.95-4.10 (m, 3 H), 4.25 (dd, J = 9, 8 Hz, 1 H), 5.00 (d, J = 1 Hz, 1 H), 5.27, (m, 1 H); ^{13}C NMR APT (CDCl₃, 100.6 MHz) & 21.29 (t'), 21.41 (t'), 23.86 (t'), 29.89 (t'), 36.72 (t'), 37.49 (d'), 44.64 (s'), 48.58 (t'), 68.72 (t'), 119.63 (t'), 140.63 (s'), 180.51 (s'); exact mass, m/z calcd for C₁₂H₁₇O₂ [(M-Cl)]⁺ 193.1229, found 193.12279. Anal. Calcd for C₁₂H₁₇O₂: C, 63.01; H, 7.49. Found: C, 63.12; H, 7.63.

cis-6a-(2-Hydroxymethyl-2-propenyl)hexahydro-1(3H)-isobenzofuranone (182).

CaCO₃ (300 mg) was added to a solution of chloride **181** (121.6 mg, 0.532 mmol) in dioxane (3 mL) and water (3 mL).⁵⁶ The resulting mixture was stirred vigorously and refluxed, open to the atmosphere, for 12 h, cooled, acidified with 10% aqueous HCl (20 mL), and extracted with CH₂Cl₂ (3 x 15 mL). The combined organic extracts were dried and evaporated. Flash chromatography of the residual oil over silica gel (1 x 19 cm), using EtOAc-hexane mixtures (40 to 50% EtOAc) gave recovered **181** (12.2 mg, 10%) and allylic alcohol **182** (87.7 mg, 78%, 87% based on recovered **181**) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 3510-3402 (br), 2931, 2859, 1763, 1450 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.31-1.73 (br m, 8 H), 2.33-2.61 (m, 4 H), 3.98 (d, *J* = 6 Hz, 2 H), 4.06 (t, *J* = 9 Hz, 1 H), 4.25 (dd, *J* = 10, 8 Hz, 1 H), 4.93 (s, 1 H), 5.11-5.17 (m, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 20.98 (t'), 21.02 (t'), 22.56 (t'), 29.88 (t'), 36.08 (t'), 36.70 (d'), 44.23 (s'), 65.50 (t'), 68.54 (t'), 115.32 (t'), 144.47 (s'), 182.43 (s'); exact mass, *m*/z calcd for C₁₂H₁₈O₃ [(M+H)]⁺ 211.1334, found 211.1336. Anal. Calcd for C₁₂H₁₈O₃: C, 68.54; H, 8.63. Found: C, 68.05; H, 8.78.

cis-6a-(2-Hydroxy-2[[[[Dimethyl(1,1-dimethylethyl)]silyl]oxy]methyl]-2propenyl]hexa-hydro-1(3*H*)-isobenzofuranone (183).

t-BuMe₂SiCl (754 mg, 5.00 mmol) and imidazole (340.4 mg, 5.00 mmol) were added to a stirred solution of alcohol **182** (695.4 mg, 3.31 mmol) in THF (30 mL).⁵⁷ The mixture was stirred for 5 h, at which point (TLC control silica, 50% EtOAc) showed no starting material remaining. The solution was diluted with Et₂O

(20 mL) and filtered through Celite (3 x 4 cm), using ether (30 mL) as eluent. The filtrate was evaporated, and flash chromatography of the crude product over silica gel (2.5 x 16 cm) with EtOAc-hexane mixtures (3 to 10% EtOAc) gave **183** (744.3 mg, 70%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil which crystallized on standing to a white solid: mp 50 - 52 °C; FT-IR (CH₂Cl₂ cast) 2930, 2857, 1771, 1472, 1252, 1108 cm⁻¹; ¹H NMR (CDCl₃, 300 MHz) δ 0.08 (s, 6 H), 0.9 (s, 9 H), 1.49-1.55 (br m, 6 H), 1.60-1.79 (m, 2 H), 2.36-2.55 (m, including a singlet at δ 2.41, 3 H), 3.95-4.10 (m, 3 H), 4.27 (dd, *J* = 9, 7.5 Hz, 1 H), 4.91-4.95 (m, 1 H), 5.26 (dd, *J* = 4.5, 2 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ -5.48 (q'), 18.30, (s'), 21.42 (t'), 21.47 (t'), 23.88 (t'), 25.86 (q'), 30.11 (t'), 36.73 (t'), 36.86, (d'), 44.67 (s'), 66.01 (t'), 68.63 (t'), 113.62 (t'), 144.06 (s'), 180.97 (s'); exact mass, *m/z* calcd for C₁₇H₂₉O₃Si [(M - CH₃⁺)]⁺ 309.1886, found 309.1885. Anal. Calcd for C₁₇H₂₉O₃Si: C, 66.62; H, 9.94. Found: C, 66.44; H, 10.09.

Methyl cis-[1-2[[[[dimethyl(1,1-dimethylethyl)]silyl]oxy]methyl]-2-propenyl]-2-[(phenylseleno)methyl]cyclohexanecarboxylate (184).

A literature procedure³⁵ for cleavage of lactones using phenyl selenide anion was followed with slight modifications: THF (4 mL) was added to a mixture of PhSeSePh (402.6 mg, 1.29 mmol) and NaH (92.8 mg, 60% dispersion in oil, 2.32 mmol) and the resulting slurry refluxed for 50 min, at which point a thick yellow precipitate had appeared. The mixture was cooled to room temperature, and dry HMPA (0.75 mL) was added. The precipitate dissolved, and a solution of lactone 183 559.1 mg. 1.72 mmol) in THF (2 mL plus 1 mL as a rinse) was added by cannula. The mixture was refluxed for 30 h, cooled to room temperature, quenched with MeOH (2 mL), acidified (litmus red) by addition of cold (0°C) HCl (0.5M, 6 mL), and extracted with EtOAc (3 x 20 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and concentrated. Titration of the resulting acid with ethereal CH_2N_2 then gave crude ester 184. Evaporation of the ether and flash chromatography of the crude product over silica gel (2 x 22 cm), using 20% CH_2Cl_2 hexane, gave 183 (82.8 mg, 19%) and selenide 184 (619.6 mg, 73%, 85% based on recovered 183) as a homogeneous [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], yellow oil: FT-IR (CH₂Cl₂ cast) 2948, 2929, 2884, 2856, 1729, 1472, 1110 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.03 (s, 6 H), 0.89 (s, 9 H) 1.25-1.42 (m, 2 H), 1.45-1.61 (m, 4 H), 1.74-1.81 (m, 1 H), 1.83-1.95 (m, 1 H), 2.33 (d, J = 14 Hz, 1 H) 2.49 (d, J = 14 Hz, 1 H), 2.94 (t, J = 11 Hz, 1 H), 3.09 (dd, J = 12.5, 2 Hz, 1 H), 3.88-3.98 (m, 2 H), 4.75 (s, 1 H), 5.12-5.17 (m, 1 H), 7.19-7.29 (m, 3 H), 7.45-7.53 (m, 2 H); ¹³C NMR APT (CDCl₃, 75.5 MHz) δ -5.38 (q'), 18.33 (t'), 22.11 (t'), 22.66 (s'), 25.68 (q'), 26.25 (t'), 29.46 (s'), 30.08 (t'), 39.34 (t'), 44.69 (d'), 50.53 (t'), 51.18 (q'), 66.24 (t'), 112.84 (t'), 126.81 (d'), 128.97 (d'), 130.75 (s'), 132.76 (d'), 144.36 (s'), 176.25 (s'); exact mass, m/z calcd for C₂₅H₄₀O₃SiSe 496.1911, found 496.1919. Methyl cis-1-[(2-hydroxymethyl)-2-propenyl]-2-[(phenylseleno)methyl]cyclohexanecarboxylate (206).

AcOH (8 mL) and water (3 mL) was added to a soluton of silyl ether 184 (248.4 mg, 0.501 mmol) in THF (3 mL).⁵⁷ The resulting mixture was stirred at room temperature for 12 hrs, cooled (0°C), and titrated with saturated aqueous NaHCO3 solution until bubbling ceased. The mixture was then extracted with CH_2Cl_2 (4 x 15 mL) and the combined organic extracts were washed with saturated aqueous NaHCO3 (1 x 20 mL). The aqueous phase was extracted with CH₂Cl₂ (1 x 10 mL) and the combined organic extracts were dried and evaporated. Flash chromatography of the crude product over silica gel (2 x 16 cm), with EtOAc-hexane mixtures (20 to 35% EtOAc), gave 206 (177.8 mg, 93%) as a homogeneous [TLC, silica, 30% EtOAchexane, ¹H NMR (400 MHz)], viscous oil: FT-IR (CH₂Cl₂ cast) 3620-3200 (br), 2941, 2864, 1725, 1578, 1477, 1174 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.21-1.40 (m, 2 H), 1.14-1.62 (m, 4 H) 1.70-1.95 (m, 3 H), 2.05 (s, 1 H), 2.31 (d, J = 14 Hz, 1 H), 2.58 (d, J = 14 Hz, 1 H), 2.91 (t, J = 12 Hz, 1 H), 3.09 (dd, J = 13, 3 Hz, 1 H), 3.62 (s, 3 H), 3.90 (s, 2 H), 4.82 (s, 1 H), 5.13 (q, J = 1.5 Hz, 1 H), 7.20-7.31 (m, 3 H), 7.45-7.52 (m, 2 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 21.94 (t'), 22.52 (t'), 26.13, (t'), 29.30 (s'), 29.95 (t'), 39.55 (t'), 44.65 (d'), 50.26 (t'), 51.32 (q'), 65.97 (t'), 114.14 (t'), 126.83 (d'), 128.93 (d'), 130.54 (s'), 132.77 (d'), 144.79 (s'), 176.51 (s'); exact mass, m/z calcd for C₁₉H₂₆O₃Se 382.1047, found 382.1051. Anal. Calcd for $C_{19}H_{26}O_3Se: C, 59.84; H, 6.87.$ Found: C, 59.89; H, 6.96.

Methyl cis-1-(2-methylene-3-oxopropyl)-2-{(phenylseleno)methyl]cyclohexanecarboxylate (185).

Ph₃BiCO₃⁵⁸ (460 mg, 0.917 mmol) was added to a solution of alcohol **206** (177.8 mg, 0.466 mmol) in CH₂Cl₂ (15 mL). The mixture was refluxed under argon for 12 h, cooled, filtered through a mixture (5:1) of Celite:MgSO₄ using CH₂Cl₂ (15 mL) as eluent. The filtrate was evaporated and flash chromatography of the crude product over silica gel (2 x 18 cm), using 7% EtOAc-hexane, gave **185** (171.8 mg, 97%) as a pure [¹H NMR (400 MHz)], pale orange oil: FT-IR (CH₂Cl₂ cast) 2936, 2861, 1727, 1693, 1437, 1282 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.10-1.19 (m, 1 H), 1.26-1.38 (m, 1 H), 1.40-1.62 (br m, 4 H), 1.73-1.83 (m, 2 H), 1.90-2.00 (m, 1 H), 2.53 (d, J = 13 Hz, 1 H), 2.73 (d, J = 13 Hz, 1 H), 2.93-3.03 (m, 1 H), 3.27 (dd, J = 13, 2 Hz, 1 H), 3.59 (s, 3 H), 6.08, (s, 1 H), 6.15 (s, 1 H), 7.20-7.29 (m, 3 H), 7.48-7.54 (m, 2 H), 9.45 (s, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 22.04 (t'), 22.97 (s'), 26.56, (t'), 30.20 (t'), 33.39 (t'), 44.68 (d'), 50.86 (t'), 51.29 (q'), 126.87 (d'), 128.97 (d'), 130.63 (s'), 132.87 (d'), 146.11 (s'), 175.25 (s'), 193.96 (d'); exact mass, *m/z* calcd for C₁₉H₂₄O₃Se 380.0891, found 380.0905. Methyl *trans*-3-hydroxymethyl-3-triphenylstannyl-(4aβ, 8aα)-Decahydronaphthalene-4a-carboxylate (186).

Ph₃SnH (51.6 mg, 0.148 mmol) in hexane (2 mL plus 1 mL rinse) and Et₃B (0.5 mL, 1M solution in hexane, 0.5 mmol) were added simultaneously over 15 sec to a solution of aldehyde **185** (27.9 mg, 0.074 mmol) in hexane (20 mL). Air (10 mL) was then bubbled though the solution over 30 sec and stirring, without protection from the atmosphere, was continued for 8 h. Evaporation of the solvent and flash chromatography of the crude product over silica gel (2 x 18 cm), using 7% EtOAchexane, gave **186** (13.9 mg,33%) as a pure [¹H NMR (400 MHz)], waxy solid: FT-IR (CH₂Cl₂ cast) 3569, 3555, 3507. 3480. 2987, 1727, 1428, 1073 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.01-1.22 (m, 3 H), 1.28-1.82 (br m, 10 H), 1.83-2.04 (m, 2 H), 3.27-3.49 (m, 2 H, simplifies to a quartet when D₂O is added), 3.65 (s, 3 H), 7.29-7.39 (m, 9 H), 7.48-7.63 (m, 6 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 23.40 (t'), 25.61 (t'), 25.99, (t'), 26.15 (t'), 37.21 (t'), 42.21 (t'), 44.97 (t'), 48.93 (d'), 51.20 (d'), 51.30 (t'), 53.31 (t'), 72.37 (t'), 128.09 (d'), 128.33 (d'), 128.49 (d'), 128.55 (d'), 136.78 (d'), 136.96 (d'), 137.14 (d'), 141.21 (s'), 176.91 (s'); exact mass, *m/z* calcd for C₂₅H₁₁O₃Sn [(M - C₆H₅⁺)]⁺ 499.1295, found 499.1306.

Thermal Radical Cyclization

A benzene (10 mL) solution of Ph3SnH (197.7 mg, 0.563 mmol) and AIBN (15 mg, 0.091 mmol) (in one syringe) were added over 10 h via syringe pump to a stirred and refluxing solution of the selenide 157b (159.2 mg, 0.433 mmol) in benzene (70 mL). Once addition was complete the solution was refluxed for an arbitrary time of 3 h. The reaction mixture was cooled to room temperature and concentrated. Flash chromatography of the crude products over silica gel (2 x 23 cm), using EtOAc-hexane mixtures (7 to 30% EtOAc), gave unreacted selenide 157b [1H NMR, 400 MHz)] (38.7 mg, 24.3 %), reduced product 159 (16.6 mg, 18%, 24% based on recovered selenide 157b) as a pure [¹H NMR, (400 MHz)] oil, the product of β scission (158) (7.6 mg, 8.3 %, 11% based on recovered selenide 157b) as a fairly pure [ca. 90% as judged by ¹H NMR (400 MHZ)], oil. and the product of closure 193 (23.5 mg, 26%, 34% based on recovered selenide 157h) as a pure [¹H NMR (400 MHZ)], oil. Compound 159 had: FT-IR (CDCl₃ cast) 2934, 2863, 1726, 1448, 1234, 1136 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.92 (d, J = 7.5 Hz, 3 H), 1.21-1.75 (br m, 8 H), 1.82-2.00 (m, 2H), 2.01-2.10 (m, 1 H), 2.20-2.33 (n 1 H), 2.35-2.46 (m, 1 H), 3.62 (s, 3 H), 9.72 (t, J = 1.5 Hz, 1 H); exact mass, m/z calcd. for $C_{12}H_{20}O_3$ 212.1412, found 212.1416. Compound 158 had: FT-IR (CDCl3 cast) 2936, 2862, 1724, 1132 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.78 (t, J = 7.5 Hz, 3 H), 1.20-2.00 (br m, 12 H, should be 10 H), 2.09-2.25 (m, 1 H), 2.56 (dd, ./ = 7.5, 1.5 Hz, 2 H), 3.65 (s, 3 H), 9.70 (t, J = 1.5 Hz, 1 H); exact mass. m/z calcd. for $C_{12}H_{20}O_3$ [(M-H)]⁺ 211.1334, found 211.1344. Compound 193 had FT-IR (CH₂Cl₂ cast) 3120-3600 (br), 2928,

2859, 1730, 1458, 1197 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.05-1.48 (m, 1 H), 1.52-1.80 (br m, 7 H), 1.97-2.15 (m, 2 H), 3.63 (s, 3 H), 4.00-4.12 (m, 1 H); ¹³C NMR APT (CDCl₃, 75.5 MHz) δ 23.62 (t'), 26.62 (t'), 28.90 (t'), 30.27 (t'), 31.77 (t'), 36.53 (t'), 38.25 (t'), 38.37 (d'), 48.69 (s'), 51.11 (q'), 66.63 (d'), 176.03 (q'); exact mass, *m/z* calcd for C₁₂H₂₀O₃ [(M - H⁺)]⁺ 211.1334, found 211.1335. Anal. Calcd for C₁₂H₂₀O₃: C, 67.89; H, 9.50. Found: C, 67.43; H, 9.69.

Triethyl Borane Cyclization at 0°C

Ph₃SnH (210.0 mg, 0.576 mmol) in hexane (6 mL plus 2 mL as a rinse) and Et₃B (1.0 mL, 1M in hexane, 1.0 mmol) were added simultaneously over 15 sec to a stirred and cooled (0°C) solution of aldehyde **157b** (86.0 mg, 0.234 mmol) in hexane (40 mL). Air (20 mL) was then bubbled though the solution over 30 sec and stirring, without protection from the atmosphere, was continued for 4 h. At this point the reaction was still incomplete (TLC control, silica, 30% EtOAc-hexane). Ph₃SnH (50.0 mg, 0.142 mmol) in hexane (3 mL plus 1 mL as a rinse) and Et₃B (0.5 mL, 1M in hexane, 0.50 mmol) were added and stirring was continued for 4 h. evaporation of the solvent and flash chromatography of the crude products over silica gel (2 x 20 cm), using EtOAc-hexane mixtures of (10 to 30% EtOAc), gave the isomeric alcohols **192** and **193**, which were not characterized, but oxidized directly to ketone **166b**. PCC (155.0 mg, 0.702 mmol) and powdered 4 Å molecular sieves (20 mg) were added to a stirred solution of alcohols **192** and **193** in CH₂Cl₂ (10 mL). The resulting

mixture was stirred under argon for 9 h and then filtered though Celite (2×9) cm. The pad was washed with CH₂Cl₂ (20 mL) and the combined filtrates were evaporated. Flash chromatography of the crude product over silica gel (2 x 20 cm), using 8% EtOAc-hexane, gave ketone **166b** (19.4 mg, 39%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil.

Thermal Radical Cyclization with Triethyl Borane.

A benzene (5 mL) solution of Ph_3SnH (100.0 mg, 0.281 mmol) and AIBN (10 mg) were added over a 10 h period via syringe pump to a solution of selenide **157b** (79.5 mg, 0.216 mmol) and Et_3B (0.48 mL, 1M solution in hexane, 0.48 mmol) in benzene (35 mL). Once addition was complete the solution was refluxed for an arbitrary period of 3 h. The mixture was then cooled to room temperature and evaporated. Flash chromatography of the crude products over silica gel (2 x 20 cm), using EtOAc-hexane mixtures (7 to 30% EtOAc), gave the product of reduction (159) (9.9 mg, 26%) as a pure [¹H NMR (400 MHZ)], oil, recovered **157b** (12.9 mg, 16%), as a pure [¹H NMR (400 MHZ)], oil, and alcohols **192** and **193** which were not characterized but oxidzied to ketone **166b**. PCC (140 mg, 0.648 mmol) and powdered 4 Å molecular sieves (30 mg) were added to a solution of alcohols **192** and **193** in CH₂Cl₂ (15 mL). The resulting mixture was stirred under argon for 12 h and filtered though Celite (2 x 9) cm. The pad was washed with CH₂Cl₂ (40 mL) and the combined filtrates were evaporated. Flash chromatography of the crude product over

silica gel (2 x 20 cm), using 7% EtOAc-hexane, gave ketone **166b** (16.5 mg, 36%, 43% based on recovered **157b**) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil.

Thermal Radical Cyclization with Ti(O-i-Pr)₄

A benzene (10 mL) solution of Ph₃SnH (182.5 mg, 0.52 mmol) and AIBN (13 mg) were added over 10 h via syringe pump to a refluxing solution of selenide 157b (159.2 mg, 0.433 mmol) and Ti(O-i-Pr)₄ (0.26 mL, 0.88 mmol) in benzene (10 mL). After the addition was complete the solution was refluxed for an arbitrary period of 3 h. The reaction mixture was cooled to room temperature and concentrated. Flash chromatography of the crude products over silica gel (2 x 19 cm), using EtOAchexane mixtures (7 to 30% EtOAc), gave recovered selenide 157b (45.8 mg, 31%) as a pure [1H NMR (400 MHZ)], oil and alcohols 192 and 193, which were not characterized but oxidzied to the ketone 166b. PCC (260.0 mg, 1.20 mmol) and powdered 4 Å molecular sieves (100 mg) were added to a solution of alcohols 192 and 193 in CH_2Cl_2 (15 mL). The resulting mixture was stirred under argon for 7 h and filtered though Celite (2 x 9 cm). The pad was washed with CH₂Cl₂ (20 mL) and the combined filtrates were evaporated. Flash chromatography of the crude product over silica gel (2 x 20 cm), using EtOAc-hexane mixtures (7 to 20% EtOAc), gave ketone 166b (6.2 mg, 11% based on recovered 157b) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil.

Thermal Radical Cyclization with Azobiscyclohexylnitrile as Initiator.

A benzene (10 mL) solution of Ph_3SnH (200.0 tng, 0.570 mmol) and azobiscycloheyxlnitrile (30 mg, 0.11 mmol) were added 10 h via syringe pump to a refluxing solution of selenide **157b** (136.3 mg, 0.371 mmol) in benzene (10 mL). After the addition the solution was refluxed for an arbitrary period of 8 h. The mixture was cooled to room temperature and concentrated. Flash chromatography of the crude products over silica gel (2 x 19 cm), using 7% EtOAc-hexane, gave product of direct reduction (**159**) (22.0 mg, 28%) as a pure [¹H NMR (400 MHZ)] oil, and axial alcohol **193** (17.2 mg, 22%) as a pure [¹H NMR (400 MHZ)] oil, and equatorial alcohol **192** (2 mg, 3%) as a pure [¹H NMR (400 MHZ)] oil.

Radical Cyclization with (bis)-t-butylazide as Photolytic Initiator.

A cooled (10°C) benzene (10 mL) solution of Ph_3SnH (200.0 mg, 0.570 mmol), (bis)-*t*-butylazide (16 mg, 0.112 mmol), and selenide **157b** (44.8 mg, 0.122 mmol) in an optically flat round bottom flask was irradiated with a sunlamp (300 W) for 6 h. The reaction mixture was concentrated and flash chromatography of the

crude products over silica gel (2 x 19 cm), using 7% EtOAc-hexane, gave recovered starting material (157b) (15.6 mg, 35%) as a pure [¹H NMR (400 MHZ)] oil and axial alcohol 193 (8.3 mg, 32%, 49% based on recovered 157b) as a pure [¹H NMR (400 MHZ)] oil.

Photolysis Experiment without Initiator

A stirred and cooled (10°C) benzene (28 mL) solution of Ph_3SnH (155.0 mg, 0.295 mmol) and selenide 157b (44.8 mg, 0.122 mmol) was irradiated with a sunlamp (300 W) for 6 h. The mixture was concentrated and flash chromatography of the crude products over silica gel (2 x 19 cm), using 7% EtOAc-hexane, gave the product of direct reduction (159) (9.8 mg, 15%) as a pure [¹H NMR (400 MHZ)] oil, axial alcohol 193 (31.8 mg, 51%) as a pure [¹H NMR (400 MHZ)] oil, and equatorial alcohol 192 (19.4 mg, 31%) as a pure [¹H NMR (400 MHZ)] oil.

Methyl (4a α , 8a β)-decahydro-2 β -hydroxynaphthalene-4a-carboxylate (192) and Methyl (4a α , 8a β)-decahydro-2 α -hydroxynaphthalene-4a-carboxylate (193).

 $NaBH_4$ (100 mg, 2.51 mmol) was added in three portions over ca. 30 sec to stirred and a cooled (0°C) solution of the ketone 166b (85.3 mg, 0.406 mmol) in dry

MeOH (10 mL). No starting material remained after 5 min (TLC silcia, 30% EtOAchexane). Aqueous HCl (20 mL, 20%) was added dropwise to the stirred and cooled solution until effervescence ceased. The solution was extracted with Et₂O (3 x 30 mL), dried, and concentrated. Flash chromatography of the crude product over silica gel (2 x 20 cm), using 15% EtOAc-hexane, gave alcohol **193** (3.7 mg, 4%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)] oil which was identical to the major product obtained from thermal radical cyclization, and **192** (67.3 mg, 78%) as a pure [TLC, silica, 30% EtOAc-hexane, ¹H NMR (400 MHz)], oil: FT-IR (CH₂Cl₂ cast) 2927 (br), 2858, 1731, 1455, 1414 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 0.95-1.29 (br m, 5 H), 1.30-1.40 (br d, *J* = 13 Hz, 1 H), 1.50-1.59 (br d, *J* = 17 Hz, 1 H), 1.61-1.90 (br m, 6 H), 1.96-2.09 (dd, *J* = 11, 3 Hz, 2 H), 3.50-3.66 (m, including s at δ 3.61, 4 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 23.40 (t'), 22.65 (t'), 29.00 (t'), 32.82 (t'), 36.35 (t'), 37.83 (t'), 38.81 (t'), 43.29 (t'), 47.75 (s'), 51.17 (s'), 70.80 (d'), 175.68 (s'); exact mass, *m/z* calcd for C₁₂H₂₀O₃ 212.1386, found 212.1408. Anal. Calcd for C₁₂H₂₀O₃: C, 67.89; H, 9.50. Found: C, 67.82; H, 9.58.

Chapter 3 Synthetic StudiesTowards Inositol (D)-1,4,5-Triphosphate

•

INTRODUCTION

The subject of inositol chemistry has grown widely over the last eight years. as is evident from the excellent book recently written by Billington.¹ Although there exists a large literature on the biological activity of inositol phosphates this review will focus on a few of the more recent synthetic approaches² to inositol 1,4,5triphosphate (1) (1,4,5-IP₃) and will outline the different strategies employed to synthesize this molecule. Inositol (-)-1,4,5-triphosphate is commercially available as the hexasodium salt for a price of \$600.00 per milligram.³

D-(-)-inositol 1,4,5-triphosphate, D-1,4,5-IP $_3$ (1)

Figure III-1

The biological action of 1,4,5-IP₃ is to act as a secondary messenger that targets specific receptors in the cell and causes the release of calcium.⁴ Before a detailed discussion of synthetic approaches to 1,4,5-IP3 is presented, some background on inositol chemistry will be discussed.

If the phosphate groups are removed from 1,4,5-IP₃ one obtains myo-inositol (2) a meso compound. Many of the published synthetic approaches to 1,4,5-IP₃ begin with myo-inositol, since it is inexpensive and readily available. There is one problem with this approach; the starting material is not chiral and therefore to be able to efficiently produce naturally occurring (-)-1,4,5-IP3 a resolution step or the use of chiral reagents is required. If (2) is ketalized with cyclohexanone (or derivatives

thereof) one obtains a separable mixture of three compounds 3, 4, and 5, all of which can be selectively hydrolyzed to the monoketal 6, Scheme III-1.5

Scheme III-1

These compounds are quite versatile intermediates since both 3 and 4 can be selectively protected as shown below in Scheme III-2.

Scheme III-2

Once the acid-stable protecting group(s) have been installed, selective deketalization can be carried out, thereby allowing for further chemistry. Scheme III-3 illustrates such a strategy.

Scheme III-3

Scheme III-4

An alternative strategy⁶ that has seen use in inositol synthesis is the orthoformate route. Treatment of *myo*-inositol with triethylorthoformate under acid catalysis in DMSO gives the 1,3,5-orthoformate 12 (Scheme III-4). The alkylation of inositol orthoformate is highly selective. Treatment with sodium hydride in DMF gives an anion that is stabilized by internal coordination to yield, upon exposure to allyl bromide for example, the monoallyl derivative 14. The 2 and 6 positons can now be benzylated, and removal of the orthoester and the allyl group produces tetrol 16.

Reaction of (2) with TIPSCl (2.5 eq.) gives the diol 17, in which the 2 and 5 hydroxyls have been left open (Scheme III-5).⁷ This strategy compliments the ketalization approach discussed earlier.

Scheme III-5

Synthesis of 1,4,5-IP₃

Several approaches to the synthesis of (1) have relied on the fact that triol 16 can be converted to 1,4,5-IP₃ by phosphorylation. Two main strategies have been developed to effciently introduce the phosphate group(s). The first (showing the synthesis of a tetraphosphate) involves the reaction of an alkoxide polyanion with tetrabenzylpyrophosphate (TBPP) 18.⁸

Scheme III-6

The second method is to alkylate with a phosphorous (III) species and to oxidize the resulting phosphite ester to a phosphate ester through the use of *m*-CPBA or another peroxide.⁹ Different leaving groups on phosphorous have been used these include halogens or amines. For example, the triol **20** was phosphorylated by reaction with the amino phosphite and this was followed by oxidation of the phosphite ester to the fully protected phosphate **21**. Hydrogenation then furnished racemic 1,4,5-IP₃ (1).^{9a}

127

steps in this sequence include the selective differentiation between O-1 and O-2, which was discovered by Gigg,⁵ over twenty years ago, and the resolution using the available menthol derivative 25.

Scheme III-7

An alternative, but conceptually similar, approach is outlined in Scheme III-8. Ketal **28** was selectively benzylated, and resolution via the camphanate ester gave optically pure **30**. The *trans* ketal was selectively hydrolyzed to give triol **32** in which the 1, 4, and 5-hydroxyl groups are free. Phosphorylation, hydrogenation, and acid removal of the ketal then produced $(-)-1,4,5-IP_3$.¹¹

Scheme III-8

Most of the approaches towards 1,4,5-IP₃ include phosphorylation at the end of the sequence. Ozaki also used an early phosphorylation strategy in his synthesis of racemic 1,4,5-IP₃ (Scheme III-9).¹²

Scheme III-9

Diol 33 (made from 3 along lines shown in Scheme III-3) was phosphorylated and the ketal was removed to give diol 34. O-2 was protected as its benzoyl ester by first protecting O-1, benzoylating O-2 and then removing the silicon protecting group from O-2. Further phosphorylation at O-1 followed by deprotection then gave racemic 1,4,5-IP₃.

Ley and co-workers¹³ developed a unique approach to 1,4,5-IP₃ starting from benzene. The meso diol **36** (available by microbial oxidation of benzene) was protected as a cyclic carbonate, which underwent epoxidation with *m*-CPBA to give **37** as the major isomer (4:1).

Scheme III-10

Epoxide opening with (R)-(+)-sec-phenylethyl alcohol under acidic conditions gave a mixture of separable diastereomers 38 and 39. Compound 38 was benzylated and

deprotected. Directed epoxidation (*m*-CPBA) then gave 42, after reprotection of the diol as its acetonide. Regioselective ring opening with the protected alcohol (DDEOH) furnished alcohol 43 with the correct relative and absolute configuration for conversion to $(-)-1,4,5-IP_3$. This was accomplished by benzyl group removal, phosphorylation and deprotection to give the target. It is noteworthy that the chiral protecting group is cleaved under similar conditions to that required for benzyl group removal. The other isomer (39) obtained in the resolution step was conveterd to $(+)-1,4,5-IP_3$ by similar chemistry.

Falck¹⁴ also used a non-inositol route in his synthesis of 1,4,5-IP₃. He chose to begin with (-)-quininc acid (45) which was converted into 46 in four steps according to a literature procedure (Scheme III-11).

Scheme III-11

Protection of the free hydroxyl was followed by reduction of the acid and conversion to allylic selenide 47. Oxidation to the selenoxide was followed by [3,3] rearrangement to furnish the transposed alcohol, and this was benzylated to provide 48. Oxidative cleavage of the olefin was followed by regioselective formation of silyl enol ether 50, that then underwent hydroboration to 51. The sequence was completed by removal of the silyl protecting groups to give triol 52, which was converted to (-)- $1,4,5-iP_3$.

The approach of Carless and Busia¹⁵ (Scheme III-12) commenced with 53. Addition of singlet oxygen, followed by reduction of the oxygen-oxygen bond, afforded diol 54. Oxidation gave two compounds, 55 and 56, of which 56 was reduced to 57. Benzylation was followed by *syn*-dihydroxylation to deliver diol 58, which was selectively protected to give 59 and 60. Removal of the MEM groups then gave racemic triol 61 which was converted to racemic 1,4,5-IP₃ by standard methods.

Scheme III-12

RESULTS and DISCUSSION

Almost all of the published synthetic approaches towards inositol 1,4,5triphosphate $(1,4,5-IP_3)$ (1) utilize *myo* inositol as the starting material.¹ Although other appoaches have started with six-membered ring structures, no published approach involved cyclizing a suitably functionalized chain to gain access to 1,4,5- IP_3 .¹⁶ We envisioned 1,4,5-IP₃ as being available from a cyclization reaction of C-1 and C-6 of a suitably modified D-glucose derivative (Scheme III-13).

In its pyranose form, D-glucose has all its substituents equatorial. If C-6 is cyclized onto C-1 then O-5 now becomes axial and all that remains (assuming suitable O-protection) in order to synthesize $(1,4,5-IF_3)$ is to ensure that the oxygen functions at C-1 and C-6 are equatorial. Naturally, differential protection of the appropriate hydroxyl groups is necessary since the unprotected target is a *meso* compound. After inspection of models, it was decided that the appropriate protecting group pattern would be as shown in Scheme III-14. At this juncture we had not yet decided on which type of ring closure we would examine first, although there were several options open to us. Our strategy needed to be flexible enough so that if one route failed we would not have to alter the sequence too much in order to try other approaches. Another self-imposed requirement was that our route should be amenable to the preparation of different analogs of (1) or other phosphorylated inositols. The general strategy shown in Scheme III-14 does, in principle, satisfy the

above criteria. The chemistry of D-glucose is a well-developed area, and therefore many different protection patterns leading to various phosphorylated inositol derivatives should be possible. The general structure of intermediate **63** is such that it should be amenable to transformation into various derivatives.

Scheme III-14

We initially envisioned a radical cyclization route, involving closure of an acyl radical onto the C-1 aldehyde to give the α -ketol system 67 (eq. III-2).

Preliminary studies on simple alkyl radicals, using the borane method, showed that this was probably not feasible, since the formed alkoxy radical was prone to fragmentation ($68 \rightarrow 69$) due to the stability of the formed radical. We were also

concerned about premature decarbonylation (70 \rightarrow 71) to give another stable α -oxygen radical (Scheme III-15).

Scheme III-15

We finally decided to examine closure of a ketyl radical (or the corresponding acyl radical) onto a vinyl sulfide¹⁷ (Scheme III-16).

The *p*-methoxybenzyl group seemed well suited to such an approach since it is fairly stable and can be selectively removed in the presence of other commonly-used protecting groups. Our target now becomes compound 72 (Scheme III-16). From our experience with stabilized radicals, the electron rich olefin seemed to be a suitable radical acceptor. The adduct sulfide 73 could be oxidized and fragmented to give an exocyclic olefin (73 \rightarrow 74), that could potentially be transformed into the required equatorial hydroxyl group by oxidative cleavage of the olefin and subsequent stereoselective reduction (74 \rightarrow 75).

We now turned our attention to the actual preparation of 72. We needed a *gluco* derivative that was differentially protected at O-1, O-2, O-4, and O-6. We therefore began with diacetone glucose 77.

Ketalization of D-glucose according to a literature procedure¹⁸ was followed by benzylation under phase transfer conditions¹⁹ to furnish 78. Acid hydrolysis²⁰ then

provided **79**. We assumed at this stage that the methyl glycoside would be suitable for our purposes, since anomeric hydrolysis should be possible.

Accordingly, Fischer glycosidation with methanol paved the way for selective O-6 tritylation which was followed by protection of the two remaining free hydroxyl groups with *p*-methoxybenzyl chloride to provide the fully blocked derivative **81** (Scheme II-17). We now needed to deprotect O-6 and oxidize the resulting hydroxyl to either the ester or aldehyde level. Since two step oxidations to the acid are known to be reliable, **81** was detritylated and oxidized with PDC to give aldehyde **83** in 78% yield. Oxidation to the acid proved troublesome, as only low yields of ester (after treatment with diazomethane) were obtained. Also, aldehyde **83** was not very stable, and handling caused elimination to oleiin **84**. Anomeric hydrolysis of **86** became a problem since the *p*-methoxybenzyl protecting groups were hydrolyzed at a similar rate to the anomeric methyl group.

Scheme III-18

We then turned to a modified route, as outlined in Scheme III-19. We decided to change the anomeric protecting group to allyl and to keep O-6 protected until such a

point when it would be desirable to carry out the oxidation step. We carried out two versions of this sequence, one with a mixture of anomers and the other with the β -anomer only. The reason for this approach was to simplify characterization of the intermediates. Compound **88** was exposed to Fischer glycosidation conditions, tritylated, and benzylated to give **90** (Scheme III-19).

Scheme III-19

The β -anomer was made via acetate 92²² as shown in Scheme III-20.

Scheme III-20

We initially utilized Wilkinsons catalyst²³ to isomerize the allyl group and we then hydrolyzed the resulting enol ethers via the mercury method.²⁴ The anomeric mixture **90** and the β -anomer **94** both gave the same mixture of lactols (**95**) upon exposure to these conditions (Scheme III-21). It was later found that the isomerization procedure,²⁵ using potassium *t*-butoxide in DMSO at 110°C followed by mercuriccatalyzed hydrolysis, worked equally well, and was most cost effective and this is the method we used from that point on.

Wittig reactions with lactols is a fairly mature field²⁶ and we envisioned that ylide 96 would react with lactols 95 to give the open chain sugar 97 that could then be benzylated to provide 98 (Scheme III-22). We examined a few conditions for effecting this ring opening, but only the first entry (NaH, DMSO) served to give the target, although in low yield (20%). Attempted trapping of the lactol as its thioketal also did not work, presumably due to the sensitivity of the *p*-methoxybenzyl groups to the Lewis acidic conditions required for thioketalization. A slightly longer but successful and high yielding, route was then examined (Scheme III-23). The lactols were reduced to diol 99 and the primary alcohol was selectively protected as its *t*-butyldimethylsilyl ether 100. This step was followed by benzylation of O-5 and desilylation to afford 102. Swern oxidation of 102 then provided the pivotal aldehyde 103. This sequence was highly reproducible and has been carried out on multigram scale with yields comparable to those shown in Scheme III-23.

Scheme III-23

Wittig reaction of aldehyde 103 with ylide 96 gave a good yield of 98 as a mixture of isomers. Detritylation proved troublesome as the yields hovered around 50%. Nevertheless, Swern oxidation of 104 finally furnished the radical precursor 72. Exposure of 72 to standard conditions for ketyl formation (SmI₂, THF, HMPA) as outlined by Curran,²⁸ gave a 30% (at best) yield of what we presume (¹H NMR) to be a mixture of four isomers (73) (Scheme III-24).

Scheme III-24

Seeing that the yield of this closure could not be improved, we turned our attention to a different route which involved an acetylene function instead of a vinyl sulfide.

The generic acetylene (eq. III-3) was available from chemistry developed by Corey,²⁹ and the advantage of this method is that different groups can be installed on the terminus of the acetylene. We first examined the terminal acetylene **107**, which was made as shown in Scheme III-25. Detritylation of **106** was followed Swern oxidation to furnish **107**. We wished to close the ring by addition of a vinyl radical onto the aldehyde. Exposure to thermal conditions for addition of stannyl radicals to acetylenes gave only complex mixtures; whereas, using the borane method provided only recovered starting material.

Scheme III-25

At this point we recognized that an ene reaction may prove very suitable for our needs (eq. III-4) since the hydroxyl function would be introduced at C-6 and cleavage of the allene, followed by selective reduction, should provide the target.

Although many published examples of intramolecular ene processes exist³⁰ most of them deal with the reaction of an olefin and aldehyde in the same molecule, and the allylsilane group works quite well in this type of reaction. We wondered what type of group R would best suit our particular needs. We first planned on examining a simple terminal methylene group (R = H) and then a propargyl silane (R = SiMe₃). Aldehyde **111** (Scheme III-26), when exposed to various conditions (Table III-1), did not prove to be a satisfactory substrate.

CONDITIONS	RESULT
140 °C, <i>p</i> -xylene	not desired product
Me ₂ AlCl, CH ₂ Cl ₂ , -78 °C	21 % isomers
TFA CH ₂ Cl ₂ 0 °C	decomposition
TFA CHCl3 RT	decomposition
CSA CHCl ₃ RT	decomposition
CSA CH ₂ Cl ₂ RT	decomposition

 Table III-1 Conditions for Attempted Cyclization of 111

Scheme	III-	·26
--------	------	-----

Although the introduction of the methyl group seemed straightforward, numerous attempts were made in order to try and alkylate acetylene **106** via the corresponding lithium acetylide. We subsequently found that only *in situ* alkylation worked well. It was reasoned that the presence of lithium bromide generated in the elimination served to break up problematic aggregates in solution. Presumably, the oxygen atoms chelate the lithium acetylide (either intermolecularly or intramolecularly) thereby making it too sterically encumbered to undergo alkylation with the electrophile. This explanation was borne out by the fact that attempted alkylation of the lithum salt of **106** (made by treatment of acetylene **106** with *n*-BuLi) in THF in the presence of LiBr (2 eq.) gave a 60% yield of **109**, plus recovered acetylene. In the absence of the lithium bromide no alkylation was observed.

The preparation of propargyl silane is shown in Scheme III-27. Alkylation with freshly distilled triflate 113³¹ gave a 78% yield of 114. Since the purification of 114 proved tedious we found it more convenient to rigorously purify the alcohol 115 and not 114. Swern oxidation of 115 then provided the ene precursor 116.

144

Scheme III-27

We expected that the reactivity of the propargyl silane would parallel that of the allylsilanes, and that under suitable reaction conditions the silyl group would be lost (or transferred onto oxygen and lost upon work up) to generate the exocyclic allene 112. Exposure of 116 to various Lewis acids (Table III-2) at low temperature gave only low yields (~20%) of what seemed on the basis of ¹H NMR spectroscopy to be the correct product.

Table III-2 Attempted cyclization of 116	
CONDITIONS	RESULT
TiCl ₄ , CH ₂ Cl ₂ , -78 °C	39%
TBAF, THF, 0 °C	~10%
BF ₃ ·OEt ₂ , CH ₂ Cl ₂ , -78 °C	10%, messy
TFA, CH ₂ Cl ₂ 0 °C	No Reaction

However, we fortuitously stumbled upon the appropriate conditions. A sample of aldehyde **116** was left in a solution of dichloromethane containing a small amount of deuterated chloroform. After standing for two days at room temperature it was found that a new compound had been formed and the structure was deduced as **117**. We were extremely surprised that the silicon unit had been retained. The ideal conditions for cyclization were found to entail conducting the reaction in undistilled aged chloroform in the presence of a catalytic amount of CSA. This gave an 84% yield of adduct **117** as a **single isomer** in which the configuration of the silicon group and the carbinol carbon were unknown. A second product was also isolated from the reaction mixture and had the structure **118** (Scheme III-28).

Scheme III-28

When 117 was resubmitted to the initial reaction conditions no desilylated product was formed. This implies that the two products are formed by two different reaction pathways. Reaction of aldehyde in chloroform in the presence of HCl gave a very complex mixture, although some of 118 was formed, as deduced by TLC analysis.

Results from nuclear Overhauser experiments to determine the relative configuration of the newly formed center were not helpful. The 3,5-dinitrobenzoyl derivative of 117 was made, but it proved not to be crystalline.

Nevertheless, we decided to carry on the sequence and confirm the configuration of the center in question by conversion to the known benzylated triol **27**. If it proved to be incorrect, we hoped that we could correct it by equilibration of ketone **119** (with the hope that elimination would not be a problem) (eq. III-6).

Benzylation of 117 proved to be difficult. Exposure of 117 to sodium hydride in refluxing THF with either benzyl bromide or benzyl iodide gave the acetylene 122 along with a small amount of the desired 121.

Scheme III-29

Similar results were encountered using potassium hydride as base. Acidic benzylstion, according to the procedure of Bundle and co-workers³² was not successful, at least in our hands. At this point it became obvious to us that the silicon group was the source of the altered reactivity of **117** towards benzylation and so this group had to be removed.

This was clearly the case since benzylation of **118** (NaH, BnBr, THF reflux) proceeded smoothly to give a 70% yield of **123** on a small scale (eq. III-7).

Interestingly enough, benzylation of 117 in DMF using sodium hydride as base with benzyl bromide gave a 50% yield (at best) of desilylated product 123 (eq. III-8), but attempts to improve the yield were not successful.

We next examined various acidic conditions (Table III-3) to remove the silicon group (117 \rightarrow 118) by protonolysis (by analogy with vinyl silanes), but none proved to be satisfactory.

CONDITIONS	RESULT
I ₂ cat., PhH, H ₂ O, reflux	no reaction
I ₂ , PhH, reflux	messy
TFA (10 eq.), MeCN/H ₂ O	No Reaction
TFA (10eq.), TBAF (4 eq.)	No reaction
MeCN/H ₂ O	
<i>p</i> -TsOH, MeCN/H ₂ O	No Reaction
p-TolSO ₂ H, MeCN/H ₂ O	No reaction

 Table III-3
 Attempted Acidic Desilylation of 117

The results of benzylation in DMF made us wonder if perhaps basic conditions may well serve to remove the silicon group. Treatment of 117 with NaH in MeOH gave only recovered starting material. Reaction with TBAF in THF gave a 64% yield of 118 but, success was finally realized by treating 117 with TBAF in the presence of TFA in THF as solvent to provide a 90% yield of 118 (eq. III-9).

The oxidative cleavage of the allene function was then examined. Ozonolysis under different conditions (-78°C, or -40°C CH_2Cl_2) of either 121 or 123 gave

complex reaction mixtures and this is somewhat in accordance with literature precedent.³³ Epoxidation with *m*-CPBA followed by treatment with acid gave a complex reaction mixture. Osmylation of 123 gave a low (5%) yield of what is presumed to be a mixture of diols 124. Presumably these diols could be cleaved to the target ketone by cleavage with lead tetraacetate.

Scheme III-30

It was at this point that the conditions for ozonolysis were re-examined and it was found that addition of pyridine to the reaction mixture gave a 70% yield of ketone 125. The amount of ozone used was important, since too much ozone did cause decomposition of the substrate probably by oxidation of the benzylic positions in the molecule. Reduction to alcohol 126 was effected by sodium borohydride in methanol/THF to give a 78% yield of the alcohol.

Tretament of 126 with TFA in dichloromethane at room temperature for 30 min gave a triol that was compared to the literature ¹H NMR spectra.³⁴ The spectra did not match since the signal for H-3 did not have the correct chemical shift. We therfore assume that the compound we have made is actually 127 in which the configuration of O-3 is axial and not equatorial.

This means that the ene reaction gave 128.

Attempts to invert the center by Mitsunobu chemistry were not successful. Only a ~10% yield of inverted product was formed along with the product of retention of configuration. This is not surprising since the reaction can go via an S_N1 displacement since an allenic carbonium ion can be formed as an intermediate.

Attempts to oxidize 129 to ketone 131 have so far been unsuccessful (Scheme III-31). If oxidation could be carried out efficiently, then selective reduction should give 132 that could then be further transformed inot the target triol 27 by a sequence similar to that used above .

Scheme III-31

EXPERIMENTAL

1,2:5,6-Diisopropylidene-D-glucofuranose (77).

The procedure of Schmidt was followed exactly.¹⁸ Diketal 77 was obtained in 46% yield and had: mp 103-104 °C; $[\alpha]_D = -9.86^\circ$ (c = 0.0071, CHCl₃); FT-IR (CH₂Cl₂ cast) 3461 (br), 2987, 2937, 2894, 1457, 1382 cm⁻¹; ¹H NMR (CDCl3, 400 MHz) δ 1.28 (s, 3 H), 1.31 (s, 3 H), 1.39 (s, 3 H), 1.46 (s, 3 H), 2.85 (d, *J* = 4 Hz, 1 H, exchangeable), 3.95 (dd, *J* = 6 Hz, 1 H), 4.01 (dd, *J* = 8, 3 Hz, 1 H), 4.12 (dd, *J* = 10, 6.5 Hz, 1 H), 4.23-4.32 (m, 2 H), 4.48 (d, *J* = 4 Hz, 1 H), 5.89 (d, *J* = 4 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 25.13 (q'), 26.15 (q'), 26.75 (q'), 26.81 (q'), 67.61 (t'), 73.26 (d'), 74.99 (d'), 81.19 (d'), 85.10 (d'), 105.24 (d'), 109.58 (s'), 111.79 (s'); exact mass, *m/z* calcd for C₁₂H₂₀O₆ [(M-CH₃)⁺] 245.1025, found 245.1026.

3-O-Benzyl 1,2:5,6-diisopropylidene-D-glucofuranose (78).¹⁹

NaOH (41g, 1.02 mol), (n-Bu)₄NHSO₄ (720 mg, 2.12 mmol), and benzyl chloride (24 mL, 0.203 mol) were added sequentially to a stirred solution of 77 (44.08 g, .169 mol) in a mixture of benzene (200 mL) and water (40 mL), and the resulting heterogeneous mixture was refluxed, open to the atmosphere, for 6 h, at which point the reaction was still incomplete (TLC silica, 30% EtOAc-hexane). Benzyl bromide (20 mL, 0.168 mol) was added in one portion and the solution was refluxed for 12 h. The solution was cooled and then poured onto water (100 mL), the organic layer was separated and the aqueous layer was extracted with Et₂O (1 x 20 mL). The combined organic extracts were washed with brine (1 x 20 mL), dried, and evaporated. Distillation of the thick residue gave 78 (46.22 g, 78%) as a pure [1 H NMR (400 MHz)], viscous, yellow liquid: bp 155-165°C, 0.17 mm; $[\alpha]_D = -26.97$ ° (c = 0.0188, CH₂Cl₂); FT-IR (CH₂Cl₂ cast) 2987, 2936, 2892, 1497, 1455, 1381, 1372, 1349 cm⁻ 1. H NMR (CΓ Cl₃, 400 MHz) δ 1.30 (s, 3 H), 1.35 (s, 3 H), 1.42 (s, 3 H), 1.48 (s, 3 H), 4.03-4.09 (m. 2 h), 4.13- 23 (m, 2 H), 4.38-4.45 (m, 1 H), 4.56 (d, J = 4 Hz, 1 H), 4.60-4.70 (m, 2 H), 5.86 (d, J = 4 Hz, 1 H), 7.30-7.41 (m, 5 H); ¹³C NMR APT (CDCl₃, 75 MHz) δ 25.43 (q'), 26.24 (q'), 26.76 (q'), 26.84 (q'), 67.42 (t'), 72.40 (t'), 72.55 (d'), 81.38 (d'), 81.78 (d'), 82.74 (d'), 105.31 (d'), 108.94 (s'), 111.75 (s'), 127.62 (d'), 127.79 (d'), 128.36 (d'), 137.71 (s'); exact mass, m/z calcd for C₁₉H₂₆O₆ [(M- $CH_3^+)^+$] 335.1495, found 335.1502. Anal. Calcd for $C_{19}H_{26}O_{46}$: C, 65.12; H, 7.34. Found: C, 65.12; H, 7.34.

α,β-Allyl 3-O-benzyl-D-glucopyranose (88).

A slightly modified literature procedure²⁰ was followed for the preparation of 3-O-benzyl-D-glucose. 3-O-Benzyl 1,2:5,6-diisopropylidene-D-glucofuranose (78) (52.7 g, 0.150 mol) was dissolved in a solution of MeOH (110 mL) and H_2SO_4 (53 mL, 1N) and heated to 80°C for 4 h. The solution was then cooled to room temperature, the MeOH was removed in vacuo, water (110 mL) was added and heating (80°C) was continued for 1 h. The resulting solution was cooled in an ice bath and neutralized (litmus) with solid NaHCO3. The mixture was evaporated to dryness and the residue was dissolved in hot EtOAc (350 mL), was carefully dried (MgSO₄), and filtered hot by gravity using hot EtOAc (200 mL) as a rinse. The solution was carefully evaporated (bumping) and the residue was dried under vacuum (0.5 mm) for 12 h to yield a white solid (39.86 g, 97%) which was not characterized, but used directly in the nex⁴ step. AcCl (1.2 mL) was added to a solution of the crude tetrol (39.86 g) in freshly distilled allyl alcohol (100 mL). The resulting solution was refluxed for 10 h, cooled to room temperature, and poured into CH₂Cl₂ (150 mL) overlaid with brine (50 mL). The organic layer was separated and the aqueous laver was extracted with CH_2Cl_2 (3 x 50 mL). The combined organic fractions were washed with brine (1 x 30 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (6 x 26 cm), using EtOAc-hexane mixtures (40 to 60% EtOAc), gave the allyl glycosides 88 (10.64g, 76% over two steps) as a pure [1H NMR (400 MHz)], beige solid: mp 59-65 °C; $[\alpha]_D = +53.0^\circ$ (c = 0.0217, CH₂Cl₂); FT-IR (CH₂Cl₂ cast) 3420 (br), 2922, 2880, 1454, 1419 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.04 (t, J = 6.5 Hz, 0.5 H, exchangeable), 2.12 (t, J = 7 Hz, 0.5 H, exchangeable), 2.19 (d, J = 9 Hz, 0.5 H, exchangeable), 2.45 (d, J = 2 Hz, 0.25 H, exchangeable), 2.50 (d, J = 2.5 Hz, 0.76 H, exchangeable), 3.29-3.42 (m, 0.4 H), 3.71-3.89 (m, 2.2 H), 3.99-4.26 (m, 1.8 H), 4.32-4.39 (m, 0.6 H), 4.70-4.76 (m, 1 H), 4.89 (d, J = 4 Hz,

0.7 H), 4.98-5.05 (m, 1 H), 5.21 (d, J = 11 Hz, 1.4 H), 5.30 (d, J = 18 Hz, 0.5 H), 5.85-5.98 (m, 1 H), 7.25-7.38 (br m, 5 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 62.24 (t'), 62.40 (t'), 68.57 (t'), 70.00 (d'), 70.03 (d'), 70.50 (s'), 71.18 (d'), 72.73 (d'), 74.37 (d'), 74.66 (s'), 74.89 (s'), 75.20 (d'), 82.78 (d'), 83.65 (d'), 97.67 (d'), 101.92 (d'), 118.10 (t'), 127.88 (d'), 127.95 (d'), 128.56 (d'), 133.41 (d'), 133.61 (d'), 138.53 (s'). Anal. Calcd for C₁₆H₂₂O₆: C, 61.92; H, 7.15. Found: C, 62.09; H, 7.15.

α,β-Allyl 3-O-benzyl-1-O-trityl-D-glucopyranose (89).

Dry pyridine (130 mL) was added to a dry 250 mL round bottom flask charged with triol **88** (10.32 g, 33.25 mmol), Ph₃CCl (13.91 g, 49.88 mmol), and DMAP (400 mg, 3.27 mmol). The resulting mixture was heated at 110 °C for 8 h, cooled to room temperature, and evaporated. The residue was dissolved in CH₂Cl₂ (200 mL) and washed sequentially with cold (4 °C) aqueous hydrochloric acid (2 x 50 mL, 0.5N), saturated aqueous NaHCO₃ (1 x 50 mL), and brine (1 x 50 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (6 x 24 cm), using EtOAc-hexane mixtures (20 to 30% EtOAc), gave diols **89** (14.62 g, 80%) as a pure [¹H NMR (400 MHz)], yellow solid: mp 47-52°C; $[\alpha]_D = + 28.41°$ (c = 0.0145, CHCl₃); FT-IR (CHCl₃ cast) 3463 (br), 3085, 3060, 3031, 2927, 2878, 1490 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.15 (t, J = 9 Hz, 0.71 H, exchangeable), 2.34-2.37 (m, 1 H, exchangeable), 2.55 (d, J = 2.5 Hz, 0.22 H, exchangeable), 3.28-3.43 (m, 3 H), 3.52-3.80 (m, 3 H), 4.05-4.20 (m, 1 H), 4.25-4.93 (m, 1 H), 4.77-4.85 (t, J = 11.5 Hz, 1 H), 4.90-4.98 (m, 2 H), 5.21-5.38 (m, 2 H), 5.90-6.03 (m, 1 H), 7.19-7.52 (-m, 20 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 63.77 (t'), 64.00 (t'), 68.32 (t'), 70.00 (t'), 70.39 (d'), 71.30 (d'), 71.41 (d'), 72.47 (d'), 74.12 (d'), 74.27 (d'), 74.69 (t'), 74.96 (t'), 82.85 (d'), 83.90 (d'), 86.80 (s'), 97.33 (d'), 101.59 (d'), 117.92 (t'), 127.02 (d'), 127.79 (d'), 127.90 (d'), 127.95 (d'), 128.45 (d'), 128.61 (d'), 133.66 (d'), 133.80 (d'), 138.60 (s'), 143.67 (d'), 143.75 (s'). α,β-Allyl 3-O-benzyl-2,4-di-O-p-methoxybenzyl-1-O-trityl-D-glucopyranose (90).

NaH (2.40 g, 60% dispersion in oil, 60 mmol) was added portionwise to a stirred and cooled (0°C) solution of diols &9 (5.18 g, 9.37 mmol) in THF (80 mL) over 5 min. The resulting mixture was stirred under argon for 30 min, at which point *p*-methoxybenzyl chloride (8.1 mL, 60 mmol) was added neat in one portion by syringe, and stirring was continued at 0°C for 15 min. The cold bath was removed and the solution was allowed to warm to room temperature and then refluxed for 24 h. The mixture was cooled to 0°C and the excess NaH was **carefully** decomposed by addition of MeOH (ca. 10 mL). The mixture was diluted with brine (20 mL) and extracted with Et₂O (3 x 36 mL). The ethereal extracts were washed with brine (1 x 20 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (6 x 24 cm), using EtOAc-hexane mixtures (10 to 20% EtOAc), gave **90** (6.96 g, 94%) as a pure [¹H NMR (400 Miz)], off-white solid: mp 41-43.5 °C; [α]_D = +8.8° (c = 0.0207, CHCl₃); FT-iR (4 HCl₃ cast) 3060, 3031, 3005, 2930, 2875, 2835, 1612,

Allyl 2,4,6-tetra-O-acetyl -3-O-benzyl-β-D-glucopyranoside (92).

The literature procedure²² for conversion of 3-*O*-benzyl glucose to 1,2,4,6tetra-*O*-acetyl -3-*O*-benzyl- β -D-glucopyranose was followed using 3-*O*-benzyl glucose (5.34 g, 19.76 mmol), Ac₂O (10 mL), and NaOAc (900 mg). Compound **91** was obtained in 42% (3.67 g) yield. BF₃•OEt₂ (2.20 mL, 16.43 mmol) was added neat over 1 min to a stirred and cooled (0°C) solution of acetate **91** (2.0006 g, 4.56 mmol) and allyl alcohol (0.37 mL, 5.48 mmol) in dry CH₂Cl₂ (15 mL) and crushed 4Å molecular sieves (200 mg). The cold bath was removed and the solution wqas stirred for 1.5 h, and then filtered through Celite (3 x 8 cm). The pad was rinsed with CH2Cl2 (50 mL) and the combined filtrates were washed successively with saturated aqueous NaHCO₃ (1 x 10 mL), water (1 x 10 mL), and brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (3 x 27 cm,) using 20% EtOAc-hexane, gave 92 (808.4 mg, 41%) as a pure [¹H NMR (400 MHz)], beige solid: mp 80-81 °C; $[\alpha]_D = -27.6^\circ$ (c = 0.0183, CH₂Cl₂); FT-IR (CH₂Cl₂ cast) 2954, 2937, 2881, 1747, 1454, 1429, 1409, 1374 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.98 (s, 6 H), 2.02 (s, 3 H), 2.09 (s, 3 H), 3.56-3.63 (m, 1 H), 3.70 (t, J = 10 Hz, 1 H), 4.04-4.17 (m, 2 H), 4.23 (dd, J = 13, 5 Hz, 1 H), 4.29-4.36 (m, 1 H), 4.46 (d, J = 8 Hz, 1 H), 4.56-4.64 (m, 2 H), 5.05-5.31 (m, 4 H), 5.79-5.90 (m, 1 H), 7.20-7.35 (br m, 5 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 20.74 (q'), 20.82 (q'), 62.28 (t'), 69.59 (d'), 69.73 (t'), 72.00 (d'), 72.45 (d'), 73.71 (t'), 80.03 (d'), 99.75 (d'), 117.37 (t'), 127.76 (d'), 127.79 (d'), 128.40 (d'), 133.48 (d'), 137.75 (s'), 169.17 (s'), 169.31 (s'), 170.75 (s') (I assume that two signals in this spectrum are coincident). Allyl 6-O-trityl-3-O-benzyl-β-D-glucopyranoside (93).

Allyl 2,4,6-tri-O-acetyl-3-O-benzyl- β -D-glucopyranoside (91) (482.6 mg, 1.555 mmol) was added to stirred solution of NaOMe (200 mg) in dry MeOH (25 mL) and the resulting mixture was stirred for 6 h at room temperature at which point

no starting material remained (TLC (silica, 70% EtOAc-hexane). The solution was neutralized with AcOH (litmus), and evaporated, and the residue was dissolved in CH₂Cl₂ (100 mL). The organic solution was washed with brine (1 x 20 mL), dried, and evaporated. The resulting crude triol, DMAP (30 mg, 0.246 mmol), and Ph₃CCl (520 mg, 1.87 mmol) were dissolved in dry pyridine (15 mL) and the mixture was heated at 110°C for 8 h. The solution was then cooled and evaporated. Flash chromatography of the residue over silica gel (3.5 x 25 cm), using 13% EtOAchexane, gave 93 (746.0 mg, 79% from 91) as a pure [¹H NMR (400 MHz)] white solid: mp 52-54 °C; $[\alpha]_D = -3.56^\circ$ (c = 0.0055, CHCl₃); FT-IR (CH₂Cl₂ cast) 3457 (br), 3060, 3031, 2925, 2878, 1490, 1148, 1359 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.65 (d, J = 2 Hz, 1 H, exchangeable), 2.68 (d, J = 2.5 Hz, 1 H, exchangeable), 3.32-3.43 (m, 4 H), 3.55 (dt, J = 9, 2 Hz, 1 H), 3.65 (dt, J = 9, 1 Hz, 1 H), 4.15 (dd, J = 15, 7.5 Hz, 1 H), 4.31-4.42 (m, including triplet at δ 4.33, J = 8 Hz, 2 H), 4.83 (d, J = 12Hz, 1 H), 4.94 (d, J = 12 Hz, 1 H), 5.23 (dd, J = 11, 1.5 Hz, 1 H), 5.33 (dd, J = 2, 17.5 Hz, 1 H), 5.91-6.02 (m, 1 H), 7.20-7.41 (m, 14 H), 7.42-7.49 (m, 6 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 64.13 (t'), 70.12 (t'), 71.66 (d'), 74.18 (d'), 74.25 (d'), 74.80 (t'), 83.92 (d'), 86.93 (s'), 101.64 (d'), 118.07 (t'), 127.11 (d'), 127.88 (d'), 128.03 (d'), 128.55 (d'), 128.67 (d'), 133.81 (d'), 138.59 (s'), 143.69 (s'). 3-O-Benzyl-2,4-di-O-p-methoxybenzyl-6-O-trityl--D-glucopyranose (95).

Rh(PPh₃)₃Cl (800.0 mg, 0.8464 mmol)²³ and DABCO (398.0 mg, 3.55 mmol) were added sequentially to a stirred solution of 91 (3.75 g, 4.73 mmol) in a mixture of benzene (45 mL), EtOH (105 mL, 98%), and water (15 mL). The resulting mixture was stirred at room temperature for 1 h and then refluxed, open to the atmosphere, for 36 h. The resulting brown solution was evaporated and the residue dissolved in 9:1 acetone:water (150 mL). HgCl₂ (14,4 g, 53.04 mmol) and HgO yellow (40 mg, 0.185 mmol) were added and the resulting mixture was stirred at room temperature for 12 h.²⁴ The mixture was evaporated, diluted with CH₂Cl₂ (100 mL), and filtered through a pad of Celite (6 x 6 cm). The pad was rinsed with CH_2Cl_2 (200 mL) and the combined filtrates were washed with 20% aqueous NaI (1 x 60 mL). The aqueous layer was extracted with CH2Cl2 (1 x 40 mL) and the combined organic extracts were washed with brine (1 x 20 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (4 x 31 cm), using EtOAc-hexane mixtures (15 to 30% EtOAc), gave 95 (3.27 g, 92%) as a pure [¹H NMR (400 MHz)] solid: mp 58-64 °C; $[\alpha]_D = +$ 7.8° (c = 0.0032, CHCl₃); FT-IR (CDCl₃ cast) 3428 (br), 3060, 3031, 3006, 2932, 2877, 2835, 1612, 1586, 1513, 1490 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.85 (d, J =2.5 Hz, 0.56 H, exchangeable), 3.02 (d, J = 6 Hz, 0.16 H, exchangeable), 3.16-3.25 (m, 0.87 H), 3.40-3.49 (m, 0.56 H), 3.52-3.69 (m, 1.86 H), 3.70-3.83 (m, including singlet at δ 3.76, 3.79, and 3.80, 7.71 H), 3.87 (t, J = 4 Hz, 0.70 H), 3.99-4.03 (m, 0.61 H), 4.25 (d, J = 10 Hz, 0.93 H), 4.60 (dd, J = 11, 2 Hz, 0.90 H), 4.65-4.92 (m,

4.40 H), 5.29-5.33 (br m, 0.51 H), 6.65-6.71 (m, 2 H), 6.72-6.76 (m, 2 H), 6.82-6.90 (m, 2H), 7.19-7.39 (br m, 16 H), 7.93-7.51 (m, 6 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 55.25 (q'), 55.28 (q'), 62.26 (t'), 62.56 (t'), 70.59 (d'), 72.96 (t'), 74.56 (t'), 74.96 (d'), 75.92 (t'), 77.50 (d'), 80.14 (d'), 81.89 (d'), 83.13 (d'), 84.70 (d'), 86.31 (s'), 86.50 (s'), 91.30 (d'), 97.65 (d'), 113.59 (d'), 113.86 (d'),113.95 (d'), 126.94 (d'), 126.98 (d'), 127.70 (d'), 127.81 (d'), 127.93 (d'), 128.08 (d'), 128.45 (d'), 128.65 (d'), 128.86 (d'), 129.63 (d'), 129.72 (d'), 129.79 (d'), 130.11 (s'),130.25 (s'), 130.63 (s'), 138.62 (s'), 138.73 (s'), 143.85 (s'), 143.94 (s'), 159.12 (s'), 159.14, (s'). An analytical sample was prepared by flash chromatography over silica gel, using 10% EtOAc-hexane. Anal. Calcd for C₄₈H₄₈O₈: C, 76.57; H, 6.42. Found: C, 76.18; H, 6.41. The same reaction with allyl 3-*O*-benzyl-2,4-di-*O*-*p*-methoxybenzyl-6-*O*-trityl-β-D-glucopyranoside gave a product identical with that obtained from the reaction with α, β-Allyl 3-*O*-benzyl-2,4-di-*O*-*p*-methoxybenzyl-1-*O*-trityl-D-gluco-pyranose (**94**).

3-O-benzyl-2,4-di-O-p-methoxybenzyl-6-O-trityl-D-glucopyranose (95).

DMSO (10 mL) was added in one portion to a suspension of **90** (4.172 g, 5.261 mmol) and *t*-BuOK (590.0 mg, 5.261 mmol).²⁵ The mixture was stirred to dissolve the solids and then heated at 100°C for 15 min at which point no starting material remained (TLC (silica, 30% EtOAc). The solution was allowed to cool to room temperature and then poured into water (100 mL) and the orange mixture was extracted with Et_2O (4 x 40 mL). The ethercal extracts were washed with water (1 x 30 mL), and brine (1 x 30 mL), dried, and evaporated. The solid residue was
dissolved in 8:1 acetone:water (20 mL) and HgO (1.71 g, 7.89 mmol) was added to the resulting solution (stirring). A solution of HgCl₂ (2.143 g, 7.89 mmol) in 8:1 acetone:water (7mL plus 2 mL as a rinse) was added dropwise and stirring was continued for 2 h at room temperature. The mixture was filtered through a pad of Celite (5 x 3 cm) and the pad was rinsed with acetone (50 mL). The combined filtrates were evaporated and the residue was dissolved in Et₂O (70 mL), washed with 20% aqueoue NaI (1 x 40 mL), and brine (1 x 30 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (5 x 30 cm), using 15% EtOAc-hexane, gave **95** (3.27 g, 83%) as a pure [¹H NMR (400 MHz)], off-white solid that was spectroscopically identical to that obtained in the previous experiment.

3-O-Benzyl-2,4-di-O-p-methoxybenzyl-6-O-trityl-D-glucitol (99).

LiAlH₄ (35 mg, 0.9223 mmol) was added in three portions to a stirred and cooled (0°C) solution of **95** (285.2 mg, 0.3758 mmol) in THF (8 mL). The cold bath was removed and the resulting solution was stirred for 1 h. The solution was cooled to 0°C, and water (0.035 mL), 15% (w/v) NaOH (0.355 mL), and water (0.105 mL) were added sequentially. The cold bath was removed and the solution was stirred for 30 min and then filtered through a pad of Celite (1.5 x 6 cm). The pad was rinsed with Et₂O (50 mL) and the combined filtrates were evaporated. Flash chromatography of the residue over silica gel (2.5 x 23 cm), using EtOAc-hexane mixtures (25 to 40% EtOAc), gave **99** (259.9, mg, 91%) as a pure [¹H NMR (400 MHz)], white solid: mp 41-42 °C; $[\alpha]_D = -6.78^\circ$ (c = 0.0115, CHCl₃); FT-IR (CHCl₃)

cast) 3460 (br), 2933, 2909, 2877, 2835, 1612, 1513, 1491, 1463, 1449, 1302 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.12 (t, J = 7.5 Hz, 1 H, exchangeable), 3.11 (m, 1H, exchangeable), 3.25 (dd, J = 9.5, 5 Hz, 1 H), 3.32 (dd, J = 9.5, 4.5 Hz, 1 H), 3.51 (m, 1 H), 3.68 (m, 1 H), 3.72-3.79 (m, including singlet at δ 3.71 and 3.72, 7 H), 3.82 (dd, J = 7, 1 Hz, 1 H), 4.29-4.35 (m, including doublet at δ 4.32, J = 4.5 Hz, 2 H), 4.46-4.56 (m, 3 H), 4.64 (d, J = 12 Hz, 1 H), 6.71-6.78 (m, 2 H), 6.79-6.85 (m, 2 H), 7.15-7.30 (br m, 16 H), 7.37-7.96 (m, 6 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 55.23 (q', we assume two signals are coincident at 55.23), 61.85 (t'), 64.69 (t'), 70.75 (d'), 72.46 (t'), 72.66 (t'), 74.33 (t'), 76.43 (d'), 79.05 (d'), 79.32 (d'), 86.63 (s'), 113.72 (d'), 113.87 (d'), 127.08 (d'), 127.86 (d'), 128.37 (d'), 128.44 (d'), 128.57 (d'), 128.76 (d'), 129.61 (d'), 129.74 (d'), 129.90 (s'), 130.29 (s'), 137.84 (s'), 143.85 (s'), 159.30 (s', we assume two signals are coincident at 159.30). 4-Deoxy-2,6-di-O-benzyl-1,5-di-O-p-methoxyhenzyl-4-vinylidene-D-myo-4inosose (118).

TBAF (0.153 mL, 1M solution in THF, 0.153 mmol) was added dropwise over 10 sec to a stirred solution of TFA (11.8 μ L, 0.1.73 umol) and 117 (52.1 mg, 76.51 μ mol) in THF (20 mL). The solution was stirred at room tempertaure for 3 h

diluted with water (5 mL) and extracted with CH₂Cl₂ (3 x 10 mL). The combined organic extracts were dried and evaporated. Flash chromatography of (-) residue over silica gel (1.5 x 28 cm), using EtOAc-hexane mixtures (20 to 25% EtOAc, (note compound comes off the column very slowly)), gave **118** (41.3 mg, 90%) as a pure [¹H NMR (400 MHz)], oil: $[\alpha]_D = 19.27^\circ$ (c = 0.0123, CHCl₃) ¹H NMR (CDCl₃, 400 MHz) δ 2.10 (s, 1 H, exchangeable), 3.80 (dd, J = 5.5, 3.0 Hz, 1 H), 3.85 (s, 6 H), 3.92 (dd, J = 7.0, 3.0 Hz, 1 H), 4.01 (t, J = 7.0 Hz, 1 H), 4.27 (p, J = 2.2 Hz, 1 H), 4.49-4.80 (m, 7 H), 5.08 (qt, J = 11, 2.5 Hz, 2 H), 6.81-6.90 (m, 4 H), 7.25-7.40 (m, 14 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 55.28 (q', we assume that two signals are coincident at 55.28), 68.64 (d'), 71.79 (t'), 72.29 (t'), 72.34 (t'), 74.19 (t'), 77.56 (d'), 78.51 (t'), 79.07 (d'), 79.83 (d'), 101.77 (s'), 113.68 (s, we assume that two signals are coincident at 113.68), 127.57 (d'), 127.74 (d'), 127.84 (d'), 128.33 (d'), 129.45 (d'), 129.50 (d'), 130.56 (s'), 130.78 (s'), 138.51 (s'), 138.76 (s'), 159.11 (s, we assume that two signals are coincident at 159.11), 205.89 (s'). Anal. Calcd for C₃₈H₄₀O₇: C, 74.97; H, 6.86. Found: C, 74.97; H, 6.62.

4-Deoxy-2,3,6-tri-*O*-benzyl-1,5-di-*O*-*p*-methoxybenzyl-4-vinylidene-D-myo-4inosose (123).

NaH (12 mg, 60% dispersion in oil, 0.300 mmol) was added in one portion to a stirred and cold (0°C) solution of **118** in THF (10 mL) and the resulting mixture was stirred for 15 min. Benzyl bromide (0.2 mL, 1.6 mmol) was added in one protion and the solution was refluxed for 12 h. The solution was then cooled, quenched with MeOH (2 mL), diluted with brine (10 mL) and extracted with Et₂O (4 x 10 mL). The combined ethereal extracts were dried and evaporated. Flash chromatography of the residue over silica gel (3 x 29 cm), using EtOAc-hexane mixtures (10 to 20% EtOAc), gave 109 (390.6 mg, 82%) as a pure [¹H NMR (400 MHz)], gummy solid; $[\alpha]_D = +$ 12.96° (c = 0.0054, CHCl₃); FT-IR (CH₂Cl₂ cast) 3029, 3002, 2909, 2864, 2835. 1961, 1611, 1585, 1513 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 3.74 (s, 3 H), 3.76-3.83 (m, including s at 3.78, 8 H), 3.95 (t, J = 9.0 Hz, 1 H), 4.02 (t, J = 4.5 Hz, 1 H), 4.06 (d, J = 3.5 Hz, 1 H), 4.19 (d, J = 12 Hz, 1 H), 4.38 (d, J = 12 Hz, 1 H), 4.50-4.60 (m, 100)3 H), 4.61-4.69 (m, 3 H), 4.73-4.81 (m, 2 H), 4.84-4.93 (m, 2 H), 6.80 (t, J = 9 Hz, 4 H), 7.12-7.19 (m, 2 H), 7.20-7.35 (br m, 17 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) 55.29 (q', we assume two signals are coincident at 55.29), 70.11 (t'), 72.35 (d'), 72.94 (t'), 73.35 (t'), 75.84 (t'), 76.58 (d'), 77.80 (s'), 78.01 (d'), 79.78 (s'), 82.87 (s'), 99.49 (t'), 113.70 (d', we assume two signals are coincident at 113.70), 127.39 (d'), 127.56 (d'), 127.63 (d'), 128.16 (d'), 128.22 (d'), 128.27 (d'), 128.34 (d'), 129.43 (d'), 129.95 (d'), 130.54 (d'),131.10 (d'), 137.96 (s'), 138.67 (s'), 139.32 (s'), 159.14 (s'), 159.28 (s'), 206.50 (s'). 2,3,6-Tri-O-Benzyl-1,5-di-O-p-methoxybenzyl-D-myo-4-inosose (125).

Ozone (pre-cooled to -78°C) was bubbled into a stirred and cold solution (-78° C) of 123 (33.0 mg, 47.22 mmol) in CH₂Cl₂ (10 mL) and pyridine (0.5 mL) until a permanent purple color was generated (ca. 3 min). The solution was stirred for 5 min and then argon was bubbled through the cold solution until the purple color disappeared. The cold bath was removed and the solution allowed to attain room temperature (ca. 3 h) and concentrated. Flash chromatography of the residue over silica gel (1.5 x 29 cm), using EtOAc-hexane mixtures (8% to 20% EtOAc), gave 125 (22.4 mg, 70%) as a pure [¹H NMR (400 MHz)], oil: $[\alpha]_D = + 8.80^\circ$ (c = 0.0083, CH₂Cl₂)FT-IR (CH₂Cl₂ cast) 3062, 3030, 3004, 2924, 2867, 2836, 1739, 1611, 1585, 1513, 1496 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 3.74 (s, 3 H), 3.76-3.83 (m, including singlet at 3.78, 8 H), 3.95 (t, J = 9.0 Hz, 1 H), 4.02 (t, J = 4.5 Hz, 1 H), 4.06 (d, J = 3.5 Hz, 1 H), 4.19 (d, J = 12 Hz, 1 H), 4.38 (d, J = 12 Hz, 1 H), 4.50-4.60 (m, H)3 H), 4.61-4.69 (m, 3 H), 4.73-4.81 (m, 2 H), 4.84-4.93 (m, 2 H), 6.80 (t, J = 9 Hz, 4 H), 7.12-7.19 (m, 2 H), 7.20-7.35 (br m, 17 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) 55.23 (q'), 55.26 (q'), 72.48 (t'), 72.66 (t'), 73.10 (t'), 73.27 (t'), 75.05 (d'), 75.78 (t'), 78.96 (d'), 81.04 (d'), 81.92 (d'), 82.70 (d'), 113.76 (d', we assume two signals are coincident at 113.76), 127.61 (d'), 127.71 (d'), 127.82 (d'), 127.94 (d'), 128.15 (d'), 128.32 (d'), 128.49 (d'), 129.48 (d'), 129.77 (d'), 12[°] (d'), 130.48 (d'), 136.55 (s'), 137.63 (s'), 138.64 (s'), 159.23 (s'), 159.37 (s'), 20 *7 (C). 2,3,6-tri-O-benzyl-1,5-di-O-p-methoxybenzyl-D-myo-inositol (126).

NaBH₄ (10 mg, 26.43 umol) was added in one portion to a cool (-20°C) solution of 125 in THF-MeOH (2 mL-6 mL). The resulting solution was stirred for 30 min at which point the cold bath was removed and stirring was continued for an additional 30 min. The reaction was quenched with 10% aqueous HCl (3 mL), diluted with water (5 mL), and extracted with Et₂O (3 x 10 mL). The combined ethereal extracts were washed with brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (1.0 x 23 cm), using EtOAc-hexane mixtures (20% to 30% EtOAc), gave 126 (7.5 mg, 87%) as a pure [¹H NMR (400 MHz)], oil: $[\alpha]_D = +9.28^{\circ}$ (c = 0.0042, CH₂Cl₂)FT-IR (CH₂Cl₂ cast) 3491 (broad), 3062, 3030, 3003, 2931, 2868, 2835, 1611, 1585, 1512 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 1.23 (s, 1 H), 3.68 (dd, J = 9.0, 4 Hz, 1 H), 3.82-3.71 (m, 9 H), 3.93 (br s, 1 H), 4.50 (t, J = 12 Hz, 1 H), 4.26-4.33 (m, 2 H), 4.70-4.45 (m, 5 H), 4.89-4.73 (m, 3 H), 6.76-6.84 (m, 4 H), 7.05-7.10 (m, 2 H), 7.18-7.35 (m, 17 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) 55.27 (q' we assume two signals are coincident at 55.27), 70.23 (d'), 72.32 (t'), 72.50 (t'), 73.26 (t'), 74.09 (t'), 75.60 (t'), 77.35 (d'), 77.93 (d'), 78.63 (d'), 79.45 (d'), 79.82 (d'), 113.74 (d', we assume two signals are coincident at 113.74), 127.51 (d'), 127.84 (d'), 128.02 (d'), 128.12 (d'), 128.33 (d'), 128.41 (d'), 128.48 (d'), 129.54 (d'), 129.72 (d'), 130.71 (s'), 130.76 (s'), 137.46 (s'), 137.72 (s'), 139.03 (s'), 159.21 (s' we assume two signals are coincident at 159.21).

3-epi-2,3,6-tri-O-benzyl-D-myo-inositol (127).

TFA (3 drops) was added in one portion to a solution of **126** (12.5 mg, 18.09 μ mol) in CH₂Cl₂ (8 mL) and the solution was stirred open to the atmosphere at ambient temperature for 30 min. The solution was quenched with saturated NaHCO3 (5 mL) and extracted with CH₂Cl₂ (3 x 10 mL). The combined organic fractions were dried and evaporated. Flash chromatography of the residue over silica gel (1.0 x 23 cm), using EtOAc-hexane mixtures (40% to 60% EtOAc), gave **127** (6.3 mg, 77%) as a pure [¹H NMR (400 MHz)], oil whose ¹H NMR (400 MHz) did not match that of the literature ¹H NMR for the known 2,3,6-tri-*O*-benzyl-D-*myo*-inositol. We therefore assign the structure of **127** as s¹ p /bove.

4,6-Di-O-benzyl-1,2-dideoxy-3,5-di-O p preta oxybenzyl-1-methyl-7-O-trityl-Dgluco-1-heptynitol (109).

n-BuLi (0.80 mL, 1.6M in hexane, 1.277 mmol) was added over 45 sec to a tot and cooled (-78°C) solution of dibromide **105** (554.4 mg, 0.5551 mmol) in F (40 mL). The resulting solution was stirred at -78°C for 1 h, at which point the cold bath was removed and stirring was continued for 1.3 h. MeI (104.0 uL, 1.665 mmol) was then added in one portion by syringe and stirring was continued for 3 h at room tempertaure. The solution was diluted with Et₂O (30 mL), and washed with brine (1 x 10 mL). The aqueous layer was extracted with Et₂O (3 x 20 mL) and the combined ethereal extracts were dried and evaporated. Flash chromatography of the residue over silica gel (3 x 29 cm), using EtOAc-hexane mixtures (10 to 20% EtOAc), gave **109** (390.6 mg, 82%) as a pure [¹H NMR (400 MHz)], gummy solid; [α]_D = +

23.7° (c = 0.0196, CH₂Cl₂); FT-IR (CH₂Cl₂ cast) 2932, 2917, 2870, 1612, 1513, 1491 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.02 (d, *J* = 2 Hz, 3 H), 3.25 (dd, *J* = 11, 5 Hz, 1 H), 3.68 (dd, *J* = 11, 3 Hz, 1 H), 3.80 (s, 3 H), 3.81 (s, 3 H), 3.84-3.90 (m, 1 H), 4.06 (dd, *J* = 8, 3 Hz, 1 H), 4.32 (d, *J* = 12 Hz. 4.35-4.45 (m, 2 H), 4.49-4.59 (m, 4 H), 4.75 (d, *J* = 12 Hz, 1 H), 4.81 (d, *J* = 12 Hz, 1 H), 4.95 (d, *J* = 12 Hz, 1 H), 6.73 (d, *J* = 9 Hz, 2 H), 6.83 (d, *J* = 9 Hz, 2 H), 6.90 (d, *J* = 9 Hz, 2 H), 7.18-7.39 (br m, 22 H), 7.45-7.55 (m, 5 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 3.87(q'), 55.25 (q', we assume two signals are coincident at 55.25), 62.53 (t'), 70.77 (t'), 71.66 (d'), 71.87 (t'), 74.14 (t'), 74.66 (t'), 76.48 (s'), 78.48 (d'), 81.42 (d'), 84.29 (s'), 86.59 (s'), 113.41 (d'), 113.71 (d'), 126.91 (d'), 127.10 (d'), 127.22 (d'), 127.25 (d'), 127.75 (d', we assume two signals are coincident at 127.75), 128.04 (d'), 128.25 (d'), 128.89 (d'), 129.76 (d'), 129.78 (d'), 130.07 (s'), 130.84 (s'), 138.76 (s'), 139.25 (s'), 144.15 (s'), 158.96 (s'), 159.16 (s'). 2,4-Di-O-benzyl-6,7-dideoxy-7-methy-3,5-di-O-p-methoxybenzyl-D-gulo-6heptynal (111).

Dry DMSO (96 μ L, 1.1351 mmol) was added to a stirred and cooled solution (-78°C) solution of (COCl)₂ (88.4 μ l, 1.013 mmol) in CH₂Cl₂ (10 mL). After 20 min alcohol **110** (133.6 mg, 0.2239 mmol) in CH₂Cl₂ (3 mL plus 2 mL as a rinse) was added via cannula. After 30 min, Et₃N (0.31 mL, 2.239 mmol) was added and, after a further 30 min the cold bath was removed and the solution stirred for 4 h. The mixture was diluted with water (5 mL) and extracted with CH₂Cl₂ (3 x 10 mL). The combined organic extracts were washed with brine (1 x 10 mL), dried, and evaporated. Flash chromatography of the residue over silica gel (2.5 x 24 cm), using 20 % EtOAc-hexane, gave 111 (174.9 mg, 85%) as a pure [¹H NMR (400 MHz)] oil: $[\alpha]_D = + 34.6^{\circ}$ (c = 0.0122, CH₂Cl₂); FT-IR (CDCl₃ cast) 3031, 2956, 2933, 2915, 2866, 2836, 1733, 1612, 1585, 1514 cm⁻¹; ¹H NMR (CDCl₃, 400 MHz) δ 2.94 (d, J = 2.2 Hz, 3 H), 3.82 (s, 3 H), 3.83 (s, 3 H), 3.88 (dd, J = 7.5, 4 Hz, 1 H), 4.09 (dd, J = 5, 2 Hz, 1 H), 4.26 (t, J = 4.5 Hz, 1 H), 4.31 (d, J = 12 Hz, 1 H), 4.46-4.53 (m, 2 H), 4.57-4.67 (m, 4 H), 4.80 (d, J = 11 Hz, 1 H), 4.94 (d, J = 11.5 Hz, 1 H), 6.85-6.92 (m, 4 H), 7.21-7.41 (br m, 14 H), 9.70 (d, J = 1 Hz, 1 H); ¹³C NMR APT (CDCl₃, 100.6 MHz) δ 3.76 (q'), 55.21 (q', we assume two signals are coincident at 55.21), 70.73 (t'), 71.02 (d'), 72.34 (t'), 74.00 (t'), 74.98 (t'), 75.64 (s'), 80.03 (d'), 81.05 (d'), 83.86 (d'), 84.35 (s'), 113.63 (d'), 113.74 (d'), 127.63 (d'), 127.83 (d'), 127.88 (d'), 128.26 (d'), 128.26 (s'), 159.24 (s'), 159.28 (s'), 201.31 (d').
