METHODOLOGY

Open Access

Applying systematic review search methods to the grey literature: a case study examining guidelines for school-based breakfast programs in Canada

Katelyn Godin^{*}, Jackie Stapleton, Sharon I. Kirkpatrick, Rhona M. Hanning and Scott T. Leatherdale

Research Question

The objective of this study was to measure the value of the Rapid Response checklist for finding relevant grey literature documents.

We also wanted to learn...

- What type of grey literature document is most frequently cited?
- Who are the publishers of the cited grey literature documents?

Methods

73 CADTH summary of abstracts
& reference lists

Total number of
grey literature
documents
captured

Total number of grey literature
documents cited in
appendix and main body

Type of grey literature
document recorded

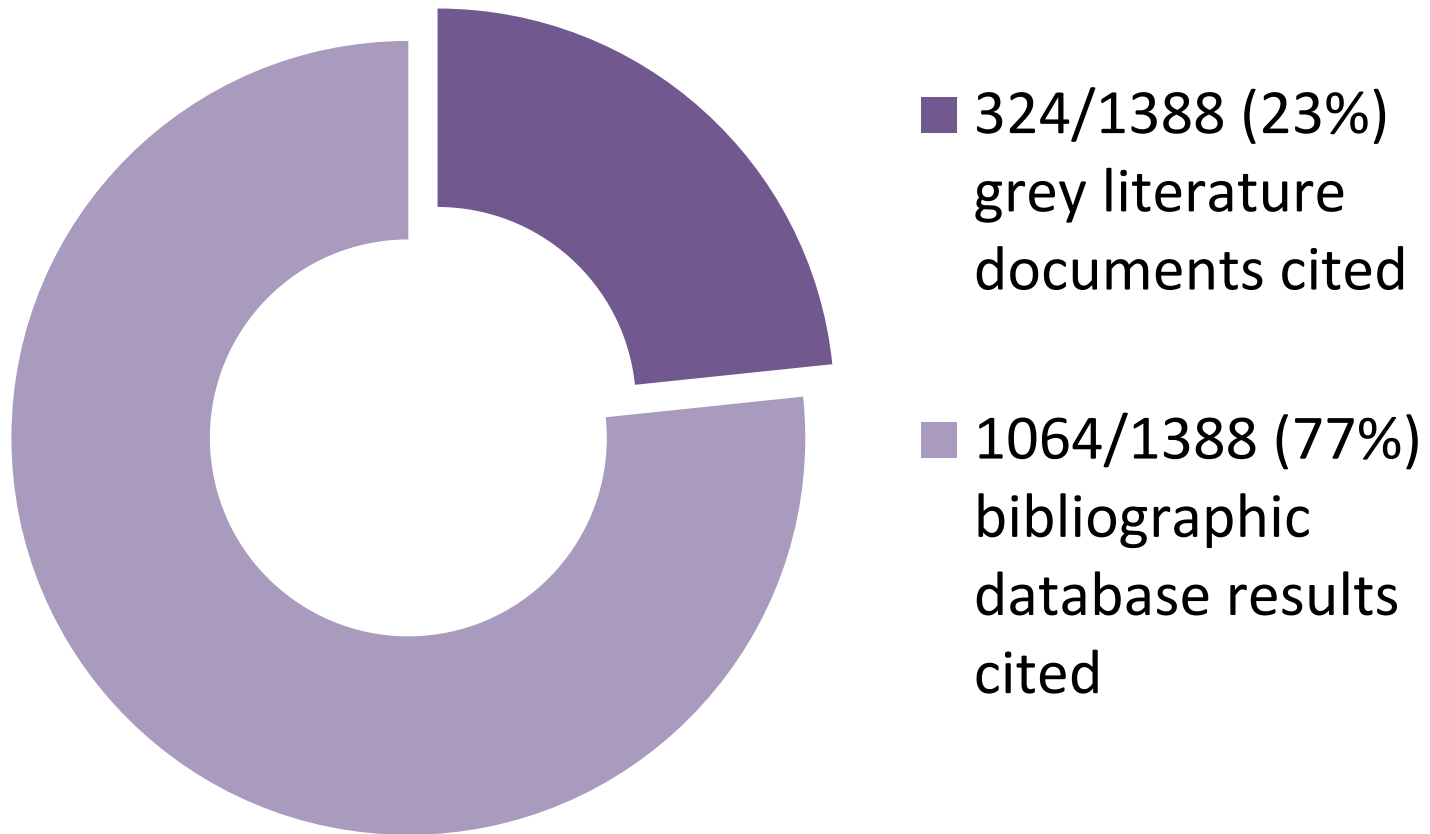

Publishing body
recorded

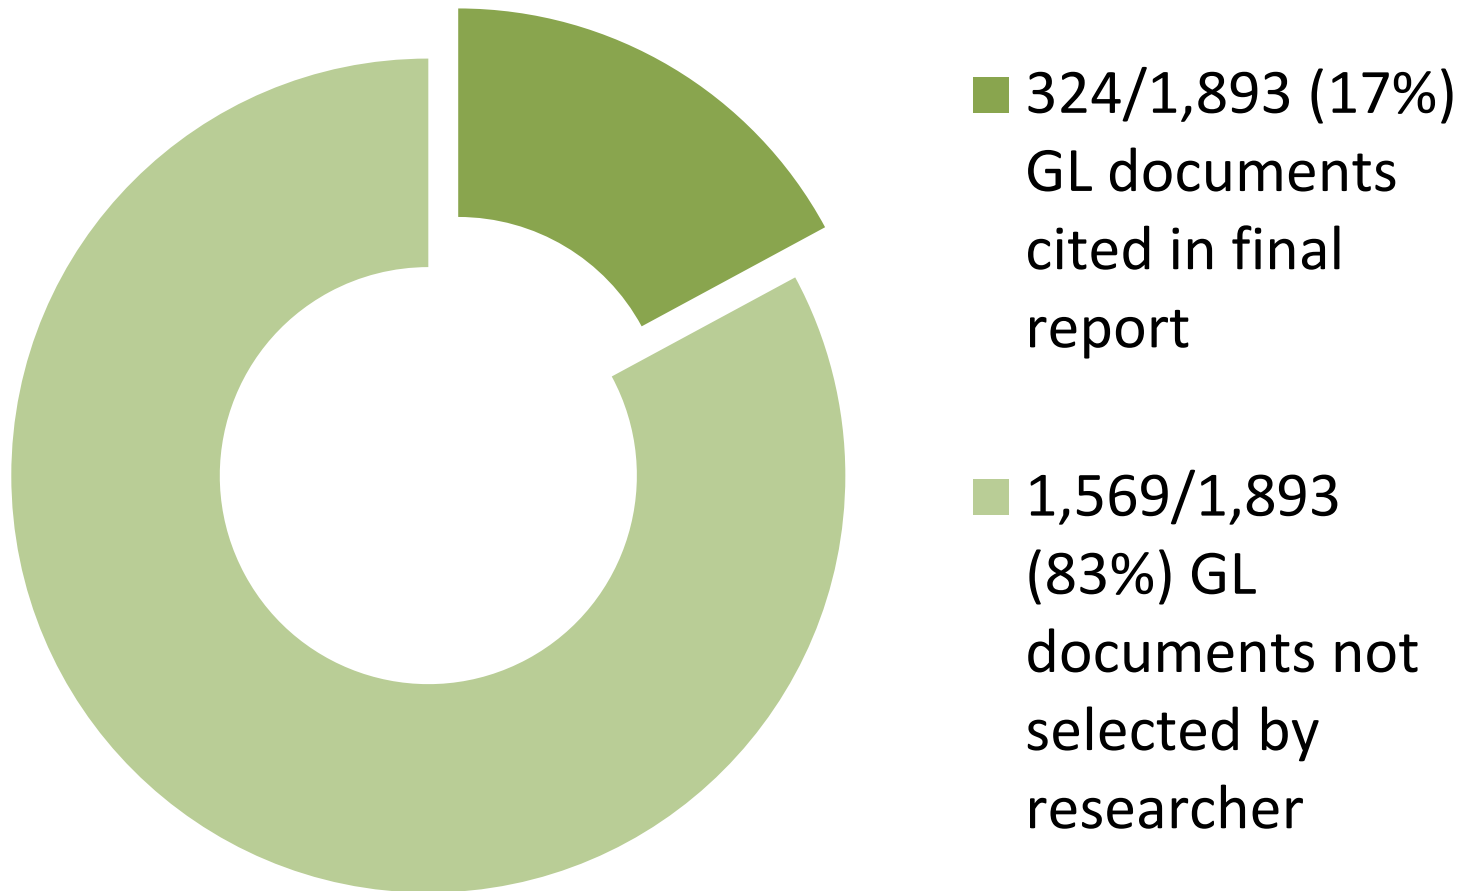

Results from 73 Reports

1. How much grey literature was cited in total?
2. How much grey literature was cited from the results sent?
3. What types of grey literature documents were most frequently cited?
4. How much cited grey literature came from websites of relevant organizations on our Rapid Response (RR) checklist?

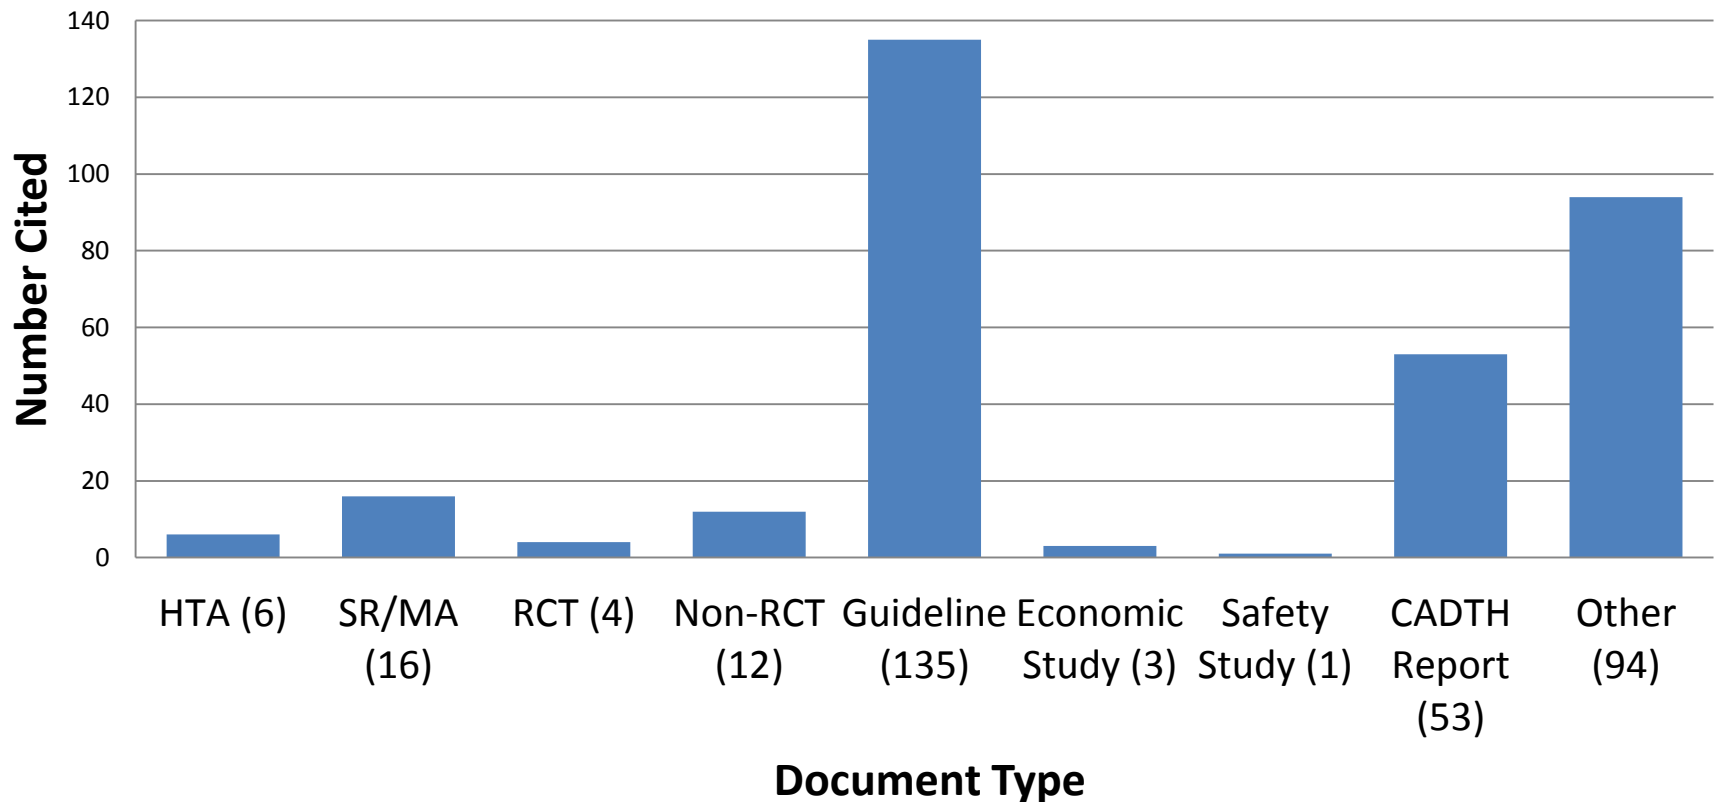

1. How much grey literature was cited in total?

2. How much grey literature was cited from the results sent?

3. What types of grey literature documents were most frequently cited?

4. How much cited grey literature came from websites of relevant organizations on our RR checklist?

Discussion

Usefulness

- We should be searching for grey literature.
- Focus efforts on finding guidelines through the grey literature search.

Time

- The RR search process is finding relevant grey literature but we may be spending too much time looking.

NOMO FOMO

- Be more selective in what we send researchers. If in (a lot of) doubt, leave out!

Future Directions

1. Can we rely on the grey literature databases to have up-to-date repositories so we can search fewer individual websites?
2. Are there grey literature documents that the researchers are not citing but using for their own background knowledge?
3. Does additional time spent searching for grey literature result in more being cited?

Limitations

1. Unless indicated by the searcher, we do not know where the grey literature documents were found.
2. Possibility that some grey literature documents are useful to the researcher but are not cited.
3. Possibility that some cited grey literature documents were found by the researcher.
4. Variation in grey literature selection methods of individual Information Specialists.
5. Sample taken from a specific point in time. Seasonal topics, newsworthy topics, etc.

Conclusion

- A formalized grey literature search approach is useful for finding relevant grey literature.
- The screening of grey literature by the Information Specialist could be more selective.
- Allow searching of some websites to be optional to allow efforts to be focused on websites of higher relevance.
- Direct more effort to finding guidelines through the grey literature search.
