ABSTRACT

This study investigates the political limits and possibilities of curriculum reform as one means of social and educational accommodation of popular dissent and aspirations within organized capitalist society. Social reform and its cultural derivatives such as curriculum reform and development is one important dimension of hegemony in capitalist societies. As such, curriculum reform must be identified, understood, and superseded if educational workers and students are not to contribute unwittingly to the reproduction of a society grounded in stratification, economic-political exploitation, the suppression of opportunities for personal and collective formation, and the global disunity of all dependent peoples.

The study develops a central methodological principle identified as practical method that draws from traditions of critical social theory and political philosophy. Practical method couples analytic perspectives of curriculum traditions, social structure and consciousness with the normative intentions of readers, the curriculum community, and the investigator in the practical organization of revolutionary political conduct. The study takes up the democratic call for citizenship preparation, through schools, by identifying and determining the critical civic competencies that persons now require to restructure public life for generalizable interests.

The study examines curriculum reform through an intellectual history of one subject field; namely, progressive

social studies education over a fifty year period in North America. It sees the developments of social studies education as symptomatic of the crisis of curriculum reform in the wider contradictions of liberal social reform in liberal, monopoly, and organized capitalist states. By tracing the inner history of progressive social education the study reveals the relations between school practice, the political economy of the state, the nature of curricular text and of consciousness formation that critical-minded school practitioners must attend to if they are serious about autonomy-based citizenship for the future.

In the first part of the study curriculum reform is identified firstly, by its phenomenal 'progressive' character in the socio-cultural work of persons, and secondly, in its essential character as a particular object within an ensemble of social relations of domination. Then the practical, methodological, and theoretical requisites for explaining, understanding, and superseding these social relations are specified as an instance of doing praxiological inquiry in curriculum.

In the second part of the study the historical manifestations of reformist interventions by the state, the school, and in curriculum development are examined. The problem identified in Part I as a problem of the mundane organization of consciousness is reconceptualized in the light of relations of accumulation and legitimation in monopoly and organized capitalist society. The role of the state as a

strategic intervenor in the organization of production and in the manipulation of cultural traditions is highlighted with a view to how personal and collective energies are emasculated by a social and vocational privatism that includes such cultural-linguistic communities as curriculum theory and research.

Part III of the study under the auspices of the practical method features a re-assembly of the sociological and interpretive perspectives on social reform-as-curriculum reform within a reconceptualized theory and practice of critical social studies education. Radical curriculum development and its derivative of critical social studies theory and practice contributes textually to the organization of discursive will formation on matters of political conduct in curriculum and community publics. As part of a wider strategy in political education the appeal to the integration of regional and global popular dissent is made as one counterinitiative against the hegemony of capital and the Canadian state within the North American empire, and its supplantation by substantive democracy.

ACKNOWLEDGEMENTS

This study would not have materialized in its present form if it were not for the efforts, patience and encouragement of some key others over the last four years. I want to express my gratitude and appreciation to friends and advisors such as Dr. Ted Aoki, firstly and foremost, as a person of great humanity and a supervisor beyond comparison; to Professor Max Innes as a friend; to Dr. Harry Garfinkle for his global visions and our long silent travels together; to Dr. William Pinar who is an icon against despair for me; to Dr. Herman Tennessen for his wonderful panache; to both Dr. Jim Parsons and Dr. Raj Pannu for good conversations and fellowship; to my parents; and to Linda Belyea, my typist.

This final year of the study, its fruition and my own release of creative energy owe a tremendous debt to Elizabeth Winsehe who has stuck with me through trauma and through joy. To her I am ever grateful. I trust I can take that spirit forward in my work.

PART I

PROBLEMS OF SOCIAL REFORM IN LATE
INDUSTRIAL SOCIETY

We must have done with the inconclusive whinings of the eternally innocent. Every man must be asked to account for the manner in which he has fulfilled the task that life has set him and continues to set him day by day; he must be asked to account for what he has done, but especially for what he has not done.

It is high time that the social chain should not weigh on just the few; it is time that events should be seen to be the intelligent work of men, and not the products of chance, or fatality. And so it is time to have done with the indifference among us, the sceptics, the people who profit from the small good procured by the activity of a few, but who refuse to take responsibility for the great evil that is allowed to develop and come to pass because of their absence from the struggle.

(Gramsci, 1977, p. 19) from 'Indifference' in Selections from Political Writings 1910-1920; Lawrence and Wishart, London

CHAPTER 1

PROSPECTS OF SOCIAL STUDIES EDUCATION IN LATE CAPITALIST SOCIETY

Introduction

The educational reforms of the progressive era must be seen, then, as the working out within the relative autonomy of the school and, in a larger sense, the state, of the ongoing dialectic between capital and labour as it developed under Canadian capitalism. Educational reform therefore had its own dialectic; and just as the working class provoked reforms which it later resisted or only partially endorsed, the reforms engendered further reforms which only reinforced the social control functions of the school. The emphasis on child study, for example, became a justification for ability grouping based on psychological testing, which only increased the internal stratification of the schools or class, sex and ethnic lines. Once again the educational bureaucracy was the key in providing the ideological legerdemain which translated the ideals of Dewey's progressivism into a reality of social control by ignoring, as Dewey himself did, the class nature of social reality.

(Schechter, 1977, p.396)

The preceding perspective that Stephen Schechter provides for us harnesses the thematic which I hope to capture and display as a research problem in this excursus. I am concerned with demonstrating and depicting the historical and political possibilities contained within the 'dialectic of educational reform' associated with reconstructionist-based social studies education, in late twentieth-century North American society.

I am concerned, in this research, with investigating the expression, practice, significance and status of social

reform in the reconstructionist social studies lineage, primarily as embodied in the text, philosophy and design of educational curricula in North America for the period 1920-1980. 1

It is within this broader historical fabric that I seek the answer to the particular research thrust of this study. I ask simply about what the utopian-normative and practical-pedagogical prospects are for the successful implementation of critical social education in the everyday discourse structures and school practices of life in the late, twentieth century industrial society of North America. We are reminded throughout the literature of the sociology of education of the essential interdependence of school and of society (Karabel and Halsey, 1977) (Sharp and Green, 1975) (Sharp, 1980). I am concerned with how it is that the psychological and structural contours of the late industrial state can both limit, emasculate, empower, and embolden curriculum research and development formally committed to radical social change. Clearly, this research question in addition to its complexity is one that is concurrently normative, conceptual and practical. These three dimensions of the inquiry are, in the wax and wane of social-political life, quite entangled with one another. In my study the normative, the conceptual, and the practical are entangled as well. They will re-appear at different points of the investigation in different methodological guises but must be seen as key and strategic lines of inquiry if I am to begin to give tentative or heuristic

answers to the plausibility of critical social reform in curricular development.

Practitioners and theorists in the curriculum field are able to give ample and convincing evidence of a legacy of failure in curriculum reform projects in the last fifteen years in Canada, the United States and the United Kingdom. By extrapolation Hamilton (1977), Reid and Walker (1975), Schubert (1980), Milburn (1977) are able to demonstrate a history of 'no significant' difference with the introduction and implementation of innovatory programs that ranged from science, language, technical to social studies education projects. They demonstrate, too, that our methods as curriculum evaluators have been practically and conceptually inadequate for understanding processes of curriculum implementation and adoption. These notes should further alarm curriculum workers and shake them of their somnolence when we realize that not only has curriculum change failed to occur in any essential way but also that we are unable to tell where we are going or what is occurring in classrooms in any meaningful pedagogical and historical sense. These remarks are generally true for the history of major regional and national curriculum development innovation, and evaluations for the period from the mid 1960's in the three countries cited. What is particularly alarming is that even as a community of workers loosely allied across two continents we possess no diagnostic languages that can point out the extent of our crises of reform; of how closely the muted conversations of

self-sufficiency and "we'll try to be more precise next-time" obscure and conceal the paralysis in curriculum change efforts. Ironically, our concerns about the crises of reform in educational work parallel the deep structural crises of accumulation and of legitimacy in the political and economic life of the advanced industrial nations. Yet as persons who are self-consciously across disciplines and implicated in achieving practical and significant results with program, we display an indifference or a falsely conscious pragmatism of the nature of political, economic and social structuring of our primarily cultural practices.

I bring to you, then, a legacy of failure in curriculum reform in the form of a plea that we must confront passionately and historically this array of reform efforts if we are to proceed practically and critically with curriculum change that yields 'significant' outcomes. I am pre-occupied with several preliminary questions in this study that are expressed in political, epistemological, and practical terms. The first two ask how and why can we know what will work for us as curriculum theorists and practitioners interested in radical social change? The third asks, more circularly, what are the realities that affect us in our reform work, and that embolden or that restrain it in the struggle to determine how we can know what we are doing? Put more rationally, I ask how can we know what will work for us as radical theorists and practitioners considering the nature of the psychological, structural and cultural realities of

our living in late industrial culture that affect us as we come to struggle with whether we know we are being practical in our relations with others in curriculum reform - whether these others are teachers, students, interested parties or other citizens?

In dealing with a practical project such as this let me tip my hat to the wisdom of experience. In the following section a secondary teacher and now student reflects on the risks of personal and institutional illusion with radical curriculum change:

Well, I think first of all the teacher has to come to some type of respect, regard ... care for their students as human beings. Those types of artificial terms like teacher and student can virtually disappear. Lots of people think that in their classrooms that (critical thought) happens ... but just because of the nature of schools, nature of the day, so forth ... it's not what we'd like to think it is. But I do think that some teachers have the ability to relate to students ... human beings working together on some issue, some question....
... it's only when relationships develop like that in classrooms that you can get to that type of (critical thought).

Some have taken a course here and then they can go and write the points on the blackboard and automatically assume that students become critical thinkers ... I didn't perceive it that way ... it's not a formula. Critical teaching is both ways. In classrooms there are so many impositions that occur that the attempt to make critical teaching is very, very difficult ... you have to be quite ... you have to live with yourself. Students often develop critical thought in such a way and begin to be critical of the institution that they're in (of which you're a part). So, you've got to be able to live with another form of criticism from your colleagues and from the institution as well.

(I think that) people look at the word fact and in people's minds it's always in terms of when did John Brown do this ... and when you look at fact critically that kind of meaning disappears and it means doing something together. You begin to recognize where you come from, your underlying assumptions, that we're all victims of ideology. So, it's very much a different type of educational experience. It's more than just questioning. In the '60's a lot of people thought they were teaching critical thought to their kids - it was just a matter of knocking things down!

But in critical teaching you must recognize that the way people perceive things is no more their fault than yours ... it's the whole historical tradition we come from ... of how we operate.... Students and you are to look at those operations. (if, in fact what you're saying is that fact is a relationship....)

Well, yes, relations are the important type of things for students to understand. Traditional schooling does not view fact in that way.

Even in the Alberta social studies program the way generalizations are handled... They're not seen in relational terms at all ... they're more like mathematical (additives)....

(author's interview with Educ. C.I. 463 student C, Edmonton, Alberta, April 1981).

I suggest that the above interviewee poses the question I wish to investigate. In order to answer my central question as to what are utopian prospects of a mode of critical social studies practice given the theoretic, everyday and structural parameters I have recognized, in living in a late industrial culture, I suggest two planes on which to see and understand the problem in this study. On one plane I am faced with letting the study portray the structural psychological forces that one confronts living as a citizen

and worker in contemporary everyday life (See Lefebvre, 1971). On the second plane I am concerned that through the conduct of inquiry of this study I can begin to ask and to reveal the kinds of questions that provide generative answers that lead myself and the community of curriculum workers (theorists and developers) somewhere along a route that redresses the historical practice of schooling. That is, this second plane is essentially a project of renewal in method. Such method is to be pre-occupied with jointly knowing and acting on several fronts. This methodological project unites my first and second planes of interest or, equally, is a normative, conceptual and epistemic practice. Answering the question of the practical and utopian efficacy of critical social education means a commitment to what Habermas (1971) has termed a realization of the good life. Given that fundamental conviction, one which I believe we are compelled to act towards as a human species and one to which a network of curriculum workers must orient self-consciously, I must assemble the kinds of qualitative inquiries this study demands.

Assessing utopian prospects for critical social studies and for projecting the kind of epistemic-practical career of such curriculum projects requires that this study ground itself, on four major inquiry fronts:

1. Existential and interpretive analysis of self and groups implicated in ongoing radical curriculum projects, that is to say, self-reflection.

2. Historical analysis of early, later and current strands of reconstructionist social education thought; that is to say, historiography of curriculum projects.
3. Social structural analysis of the late capitalist state, its modes of economic production, accumulation and legitimation and those organic linkages vital to the maintenance of cultural production in schooling; that is curriculum theory and practice. In other words theoretic description or political economy of curriculum is practised.
4. Practical, conceptual but speculative analysis of current manifestations of critical or reconstructionist social education and their utopian promises. This sub-project is couched in an essentialist reading of the material, cultural and axiological requirements of citizens living in late global capitalist economies. It argues for the kind of organization of curriculum practice generative of democratic publics. That is to say, this front of the study is explicitly a normative excursus.

The four fronts of sub-projects of the study can be seen to be unified and given perspective by an ongoing dialectic of method. The method is dialectical, firstly, in that it draws perspectives from four fronts of inquiry at different moments in order to confront and answer the immediate question of resistance and reform in social education. Hence, at different moments it draws horizontally, or synchronically, from diverse discourses to deal with an essential, practical issue. The method is dialectical and diachronic in contour, secondly, in that it demands the participation of both author and reader as co-sponsors of the critical project. It demands, as a community of curriculum workers, that our biographies and intimacies as persons be drawn into the fray of this

study as we embark on answering and reformulating the question of how we know the nature of effective reform in social education. As I or the reader or the traditions address the question of the practical, political and normative prospects of reform, we engage in a second dialectic of confusion and understanding - as each interest attempts to disclose the constraints and possibilities embedded within the language and practice of social reform education. In a sense, then, the study is regressive, synthetic, analytic and progressive in its project of the explanatory mobilization of curriculum change. (Pinar, 1980)

As a unity of interests on practical fronts, the study asks about the political, pedagogical possibilities required or inherent in successful forms of critical social education curriculum. I can restate this in terms that equate this study of social studies curriculum reform as the development and living out of a theory of ideology, as a citizen and school person participating in the routines and counter-routines of self-reproduction in late industrial cultures. I am concerned then, not just with ideas, but with the material practices this idea (curriculum theory) entails, for the signifying practices of our language are the crucial embodiments of ideology. They have a determinate influence upon reproducing and reconstructing our economic, cultural and political lives. Within our language lie the trajectories of hope.

I have argued so far, in this introduction, for the importance of situating the discourse and practice of educational reform within the political-economic structures of monopoly capitalism. I have also argued for the importance of historical portrayal of current and past curriculum activity in social reconstructionism. I have said that in order to appraise the utopian promises of new cultural forms such as a critical social studies, we must unify inquiry or the former fronts with a thematization of self and community struggles and ambiguities relevant to our interests in social education. Each of these fronts we must gather to mediate with one another in order that they can become radically practical in any discourse and action committed to critical social education. In investigating social studies curriculum change we are generating at the same time a theory of ideology or, as Willis (1977) would term it, a theory of cultural forms. In using the term ideology in its normative, investigative sense, I am employing an acutely Marxist usage (see Seliger, 1978; Geuss, 1981). In establishing an equivalence between the constructs ideology, cultural forms or reproduction and curriculum practices, I will argue for the importance of understanding the role of curriculum practice in social reproduction.

Considerable research in the sociology of education and the sociology of curriculum, or particularly, (Karabel and Halsey, 1977; Sharp and Green 1975; Sharp, 1980; Levitas, 1974; Flude and Ahier, 1974; Bernstein, 1971; Bourdieu, 1976;

Apple, 1979, 1982A, 1982B; Giroux, 1981 and others) have begun to document the functions of curriculum practice for maintaining the conditions for the elaboration and sustenance of continued material production under monopoly capitalism (Baran and Swezey, 1966; Mandel, 1975). I take as a signal feature of this study how particular cultural forms such as curriculum theory and practice can sustain, mystify, resist and offer alternative possibilities for the reproduction of labour power, mental and manual dispositions to work, microcosmologies of cause and effect, patterns of intimacy, intellectual divisions of labour and modal forms of consciousness, itself, in the service of the socio-economic reproduction and legitimation of the society/social formation we inhabit. In particular, social theorists such as Bourdieu (1976), Bernstein (1971), Williams (1977), Habermas (1975), Horkheimer (1974), Willis (1977) point to the possibility of the study of the cultural as a semi-autonomous level of human practice, and its special case, curriculum practice, as being both determined and determining in its mediations with private consciousness, economic and social structures.

In a remarkable study, (Learning to Labour, 1977), whose origins lie at the Centre for Contemporary Cultural Studies in the English midlands, Paul Willis investigates the role cultural forms play in damning the lives of working class students condemned to a future in manual work. Willis is able to display that dominant cultural forms in English

industrial, class culture do not absolutely condemn these "lads" to a future of manual labour but that their social and personal fates are achieved with the active complicity of the lads. Despite the apparent dominance and opacity of working class and technological cultural forms, there is always room to generate alternative or counter-ideological movements to stabilize the penetration of dominant or repressive meaning systems. The "lads" are able to elaborate a series of alternative norms and meanings that challenge dominant forms enabling them to inscribe a circle of community, for themselves. I can note parallels in Canada and the United States in the way of curriculum projects, alternative schools and living educational policy options that represent counter-ideological thrusts, towards radical education change. The question that becomes investigable, through this study, is what the nature and possibilities inherent in our dialectic of reform become as possibilities and realities that we must become conversant with, in a community of curriculum theorists? In a deeply practical way, we must know what questions to ask about the structures and intentionalities that ground dominant and alternative cultural practices. The legacy and practice of reconstructionist social studies is theoretically and practically interesting with regard to the promises and visions it has made. This study carries an obligation to inquire into the practices that thwart or cultivate authentic criticism through social education.

I shall continue in this introduction with a brief delineation of what I consider to be the important theoretical distinctions that are a necessary ground plan prior to any detailed empirical sketch of the study.

This study is predicated on the notion that the cultural level of curriculum practice is important as an area of study in its own right; that by no means do economic structures of advanced capitalism absolutely determine cultural or ideological outcomes nor do schools through their intentional programs merely reproduce the de-skilled, docile gentlemen of Tony Burton's (1972) educational cornucopia. That, in fact, autonomous structuring is occurring at the level of curriculum practice. It is a structuring of relations that generate consciousness, community, rationality, constraint and divisions of labour and discourse. Granted, structural and economic determinants and class background interpenetrate curriculum practice yet do not cause persons, through schools, to blindly assent to their forces. I am interested in how such structures mediate with personal action and consciousness through curriculum practice so that in turn there are structural determinations within the cultural-curricular realm in its own right. Curriculum practice as an instance of cultural form is reproductive for the social totality since the material and practical embodiment of institutional and productive forces are achieved ultimately only through practical normative communities of expression, dissent, confirmation or transcendence. Clearly, the school as an ensemble of curriculum practices is a central mediating agency between production

relations, the state and ideological projections. The more organically interdependent social, economic, and cultural functions become in late capitalist societies, the more complex become the inner relations of these sectors. As a result, the importance of our inquiry into the language and practice of educational reform as an inquiry into the dialectic of reproduction and resistance through schools is confirmed as one route for understanding the possibilities of radical strategies in social education.

Curriculum as a field of endeavour being a set of normative conversations on how to proceed with children/students still begs the question of why decision-taking historically has occurred the way it has. Why has there been a legacy of failed reform initiatives in pedagogy, in learning psychology, and in curriculum implementation? And, why are the same forms of knowledge and procedure repeatedly used as decision bases to supposedly move closer to the pedagogical truth? How and why do teachers and students resist change efforts whether of a reproductive kind or of a more radical nature - especially when they may glimpse where their real interests lie? If the cultural level of curriculum practice depicts a world inhabited by persons actively, evaluatively, reflectively constructing their own accounts of their school world and of their occupational and economic aspirations in years to come, why are they often seen to be profoundly conservative and complacent? If autonomy can be documented and identified through children's culture, (York -O.I.S.E. projects for instance) adolescent and high school sub-cultures, (Winnipeg,

Edmonton and Philadelphia projects, for instance), the working class culture of Willis' lads in the English midlands, then, is it possible to take and deepen these self-in-the-future projects so as to have the language and practice of curriculum reform become pregnant with alternative, suggestive possibilities? Because of the complexity of cultural practices in late capitalist society, persons conduct their lives as precarious, ambivalent intentioned relations always on the verge of creative or transcendent possibility. To intercede with this dialectic of educational reform can bestow understanding for us of the realities impinging upon radical curriculum change. To intercede carefully means, too, to pose the questions and consequent discourse that is generative of critical, creative relations. It is the textures of restraint and possibility in school life and curriculum decision-taking that are the auspices of this study's portrayal of the deep structures of cultural elaboration. What could remain a tragedy is how the contestations over opportunity and equality of condition waged by citizens are effectively muted and emasculated by their own hands. What role does the theoretic and 'smiling face' of curriculum reform play in this struggle?

Or do we as curriculum theorists face a promethean struggle against the odds of history, mass inertia, false consciousness and industrial totality that render our plans for radical practice confined to private therapies or marginal communities? Willis discusses the residues of freedom

that the late capitalist state with its attendant contradictions provided.

The huge growth of the state in welfare and education, for instance, is not necessarily in any 'best' interests of capitalism. It has to some extent been forced on it by competing groups using their own real freedoms for self-advancement as they have seen it. Of course state agencies have utilized and modified to help cool out, or drive out, problems which capitalism produces but cannot solve. But whilst they help to solve problems those institutions cannot wholly be absorbed back into capitalism. They maintain spaces and potential oppositions, keep alive issues, and prod nerves which capitalism would much rather were forgotten. Their personnel are in no simple sense servants of capitalism. And further ... the bureaucratic educational welfare state machine so characteristic of Western capitalism must be seen in part as the result of a cumulative encrustment which capitalism manages to turn to its advantage rather than as the expression of its own will or straightforward domination.

(Willis, 1977, p. 176)

The structural position of groups within a late welfare state system who reproduce the capitalist form while also marginally or potentially critical of it is similar to the spokespersons of early progressivism. I can identify, as does the study, the rhetoric, curriculum planning, and calls to action of Counts (1969), Rugg (1936), Brameld (1957), Harris (1926) and others who saw school reforms as a necessary, but opportunistic, response to the dislocations of emergent monopoly capitalism. School reform and social interest-centred curriculum design was the response of progressive reform movements to shore up the fractures of community and

shared normative visions of earlier socio-economic eras in North America. Unwittingly, many progressive curriculum policies had the effect of instrumentalizing a sense of community amongst diverse ethno-cultural groups new to North America without securing their own participation in this movement. Curriculum reform, ostensibly directed to social renewal and the cultivation of individual interests in the New Society tended to divide future labour power into ethnic social classes. A specious common vision was achieved by the functional dependence and specialization of labour in industry. A technical calculus acted as the normative flux of a new organic order. What Willis reminds me of and what we see through historical study of progressive variants in education and politics, is the functional accommodation of labour and of future dispossessed citizens under the guise of progressive and sometimes radical thinkers of that generation. In examining their work, I have found little evidence of duplicity in their practice but a sense of structural blindness or amnesia when it comes to seeing the pedagogical and historical implications of living through class-mediated, monopoly capitalist forms. (The same can be said of Marx and the underestimation of the tenacity of capitalist production relations and hegemony). In this study I am faced with a distinct problem of working in and through the distorted consciousness of educational reform. For within this discourse is much good intention, courage and conscious struggle against the density of subtle reifications and the

not so subtle slanderous dominations of the state.

We are faced in a study of this kind with investigating how the deformities of educational reform and practices are accomplished structurally, relationally, epistemically and existentially. It is to the credit of curriculum scholarship of the last 10 years that it illuminates greatly the mechanisms of cultural practice in schooling. Theory and appraisal sponsored or produced by Aoki (1978), Apple (1971, 1979), Pinar (1975, 1981), Van Manen (1981) and many others has been able to point to the unintended, informal, or habituated vocabularies of motive of relations and practices in school and textual elaboration that mediate and reproduce institutional life. Research, alone, in the area of hidden curricula shows the importance of the school in the production of mental labour power, consciousness and reproduction.

In any discussion or study, then, of the formal or pragmatic practices of curriculum theory and development, it is incumbent on the investigator to view the effects of curriculum discourse as a formally-situated set of relations along with the effects of this discourse at an informally less-intentioned level of institutional maintenance. The notion of the hidden curriculum points beyond the formal to the deep relations, structural and existential, that are the grounds and stem of possible formal practices. These formal accounts have been in the absence of critical practical inquiry, the only focus of conventional research methodology or more human science ethnographies. The

deeply-felt intimacy of personal collaboration with and against others in institutional life has not been thematized. This is a necessary, preliminary yet ever present disclosure that must be available to this inquiry before understanding of the dialectic of educational reform can be sustained. Sharp and Green (1975) and Willis (1977) characterize the auspices of understanding school life and curriculum practice in this way even if not explicitly. That is, received curricular text, and its hermeneutics, is not sufficient disclosure for understanding the kind of human agency we see as a bemusing, contradictory flux. Received or formal curriculum text undergoes a more radical accounting at the levels of informal cultural practices in the attempt to integrate 'official' ideological versions within the life experiences of teachers, students and theorists. By transforming official myths, both Sharp and Willis argue school and curriculum practitioners exert some personal mastery over life and professional situations, yet ironically incorporate themselves and their alternative discourse into the wider logic of social reproduction. This is as true of the working class counter-culture of Willis' lads as it is of the community school, public issues curricula or reconstructionist pedagogy. Every reform move then occupies a social and historical space in time, both structural and interior time. Each reform, as well, is consequential, even if invisible in formal analyses, for social and cultural reproduction. Let me reconsider, at this point, the particular historical thematic of this study and I quote

lengthily from Willis:

... for instance, progressivism has been developed and theorised as an official ideology by academics in conjunction with wider social democratic, political and institutional movements to increase educational provision and access for the working class. (Pragmatically), progressivism is taken up in schools mainly as a practical solution to practical problems without any real shift in basic philosophies of education. (Culturally), it can be argued that often 'progressivism' has had the contradictory and unintended effect of helping to strengthen processes within the counter-school culture which are responsible for the particular subjective preparation of labour power and acceptance of a working class future in a way which is the very opposite of progressive intentions in education. It is this strengthened cultural reproduction in relation to the school which of course guarantees the future of educational experiment by always limiting the scope of its success.... Progressivism, (reconstructionism) have actually addressed real problems, have protected kids a little longer from the harshness and inequality of industry, and have helped to give them - in unintended and unexpected ways of course - a definite kind of insight and cultural advance not available to their parents. We must not, simply, be naive about what is meant by advance. We must ask in what form, for whom, in which direction, and through what circles of unintention, with what reproductive consequences for the social system in general, particular advances are made. (echoes of M.F.D. Young)

(Willis, 1977, p. 178)

The terms of a critical-practical or praxiological study such as this one require that we go beyond the institutional calculus of restraint and transcendence of Willis, Sharp and Green, Apple, Giroux, Marx and others to begin to disclose the strategies of intimacy, of courage, and revolution through others, and the deliberative mechanisms that

will unbind practitioners and citizens for radical curriculum and cultural practice; to pierce through the evanescent dogma of assembled wisdom as a guide to theory-guiding action.

To reiterate:

1. One front consists of existential and interpretive analysis of self and of groups implicated in ongoing radical curriculum projects. That is to say, this front consists of personal and collaborative self-reflection. Owing to the praxical nature (to be outlined later) of the study, this methodological orientation is present within this proposal and the study as part of a generative, reflective, text that gels, dissolves and reconstitutes as a different unit as the structural, historical, and speculative moments of inquiry emerge. I will point to certain canons of method that I will observe in a following section.
2. A second front consists of historical analysis of early, later and current strands of reconstructionist social education thought. That is to say, this front of inquiry consists of an historiography of particular curriculum reform projects or movements in North America for the period 1920-1980.

Much of the activity of the progressive era in educational reform in Canada and the United States can be seen emanating from the decade 1925-1935. Social and historical theorists (Kolko, 1963; Williams, 1961; Weinstein, 1968; Karier, et al, 1973) of liberal and revisionist persuasion note that the rise of the philosophy of pragmatism was accompanied by the emergence of increased state intervention in

the educational and cultural policies of both societies. These historians argue that interventionist state becomes increasingly visible as the nature of the capitalist economy changes in North America. That the beginning of the decade, 1930, shows significantly increased state intervention in social welfare, educational, cultural and significantly economic policy direction. Not only is the state seen to be acting as an arbiter of social displacement, and immiseration that was rampant in the decade, 1930, but it acts to stabilize and direct capital accumulation, capital investment, and to allocate certain goods and services to an extent not structurally felt since the organization of laissez-faire capitalism. This intervention has had profound implications not only for the growth and stabilization of capitalist production modes but also for superstructural forms such as cultural practices, ideological expression and the elaboration of secularized, mass consciousness.

The bases for the Canadian welfare state, in the 1930's, lay with the interests of the indigenous business class who recognized not the injustices of monopoly capitalist production but the structural reforms needed to save the system from itself. The cyclical nature of recession and expansion was particularly acute in the decade 1925-1935. It was coupled with incipient radicalism that appeared in labour and farm groups and some professions. These movements induced the business class to sponsor programs of reform in government spending, social and labour

legislation and educational provision. Despite formal claims by the interventionist state, virtually no redistribution of wealth or power occurred. There may, in fact, have been a reversal in its democratization due to corporate concentration and government interlocks between industry and finance, which extended to cultural-educational sectors.

As is the concern in this study, I have assumed that increased state intervention or the announcement of social 'reform' has actually been synonymous with substantive or qualitative change. By looking historically at economic reforms and schooling reforms of the 1930's, I am posing questions about the ideology of reform rather than giving a prima facie documentation of societal changes. In determining the interests underlying the dialectic of reform, I discover that state expansion secured the economic and political privileges of the business class while 'retooling' sectors of the society further preserved its formally democratic yet repressive form. As the state increases its participation in labour control, tariffs and competition, infrastructural financing for the benefit of investment, and the socialization of employment, the impact on socio-cultural life is significant. Hence the state, in both the United States and Canada, can be seen balancing the environmental requirements of a business class for continual profit maximization and the smoothing of social and political unrest by the unemployed reserves and disgruntled labouring classes while rising expectations of prosperity and employment never

ceased. The state, increasingly, was accepted by both constellations of classes as a means of mediating the logics of capital accumulation and discontent. The consideration that the business and government pursued was, "How could social reform as a process be controlled or monitored so that their own interests and agencies were not undermined but sheltered by an ideology of reform?"

Donald Creighton, the historian, documents in the period prior to the 1837 rebellions of Upper and Lower Canadas, that the British governors through constitutional sanction of political appointments favoured a political economy of persons that concentrated positions in government, merchant activities, banking and landholding. We find the same intervention documented throughout Canadian history from the National Policy of 1879, the state-sponsored reformism of the 1930's, to the extensive interlocks of industrial-financial-media-government sectors in the 1960's and 1970's (see Porter, 1965; Clement, 1975).

I am particularly interested in the capacity of the business class and the state to channel the politics, language and opportunities for social reform during the early progressive period and in its current expressions - either initiated by the state or by interest groups marginal to the locus of political-economic decision-making. In a study that investigates the curriculum practices of institutionalized schooling, I encounter ideological relations that express the interests of a dominant class as the

universally-shareable interests of all social classes. Clearly, curriculum planning is centrally implicated in the study of hegemony and the vital importance such a phenomenon has for cultural and social reproduction. For instance, questions of how curriculum practice contributes to the personalization of fault by citizens caught in the political-economic system; to the belief that social problems are resolvable through technical, piecemeal panaceas; that the images schooling and media project of Canadian opportunity and condition are tenable; to the radical concessions given to the labouring class as being what they seem; and the mass social conviction of the eternally fixed nature of structural and institutional forms as part of everyday conversation, all breed a cynical dilettantism in efforts at reform or radical restructuring by school persons and curriculum theorists. This outcome can effectively blunt the deep sense of what strategic political and epistemic practices are called for in the intellectual communities that we inhabit. Both a structural knowledge of the development of our society and a personal courage are required to lay the groundwork for generative debate and action that sees beyond the web of legitimation sponsored by increased state intervention.

At this point, I want to discuss briefly the role of reform and oppositional culture in the political, economic and cultural sectors in both Canada and the United States for the decade 1925-1935. I will select some key groups or movements relevant to the purposes of this study - some

of whom could be characterized as reconstructionist.

The Canadian context at the beginning of the 1930's saw a number of conflicting group conceptions that were in opposition to political-economic relations. Industrial workers, farmers particularly in the West, fragments of the intelligentsia, and small town petit bourgeois artisans or community producers formed over the course of this period movements, syndicates and political parties rooted in their particular interests. The Co-operative Commonwealth Federation, a forerunner in social democracy to the New Democratic Party, at its first national convention in 1933, declared itself in opposition to capitalism yet remained committed to electoralism. Based on British Fabianism and Labourism, the C.C.F. saw the progressive reform of the human degradations of capitalism as a central aspect of its program. Although the 1933 Regina Manifesto reflected the "present capitalist system", as one of "domination and exploitation of one class by another" there was a steady erosion of its early radicalism to the currently milque-toast reform politics in the New Democratic Party.

A group attached to the early C.C.F. was a coterie of Toronto-Montreal intellectuals committed to ostensibly radical analysis and long range social planning. Comfortably ensconced, elite trained intellectuals the League for Social Reconstruction was of sad conscience for the immiserated underclasses of Canadian industrialism. They displayed through their writing and analysis what might be called an

aristocratic socialism. The League developed positions which insisted that political democracy be available to the people who in turn must entrust that proxy to experts, attuned to the social and historical needs of Canadian society. The key words that marked this incipient meritocracy of social planners were "efficiency", "planning", "education", "technology" and "order". The League, responsible for drafting a section of the C.C.F.'s Regina Manifesto indicated that

a proper collective organization of our economic resources such as will make possible a much greater degree of leisure and a much richer individual life for every citizen....Planning, it said, was needed for efficient development of national resources and equitable distribution of national income. It was proposed that a national planning commission, consisting of a (small body of economists, engineers and statisticians assisted by an appropriate technical staff) would work with the managing boards of socialized industries to insure that production, distribution and exchange were properly co-ordinated. Import and export boards, socialized finance, socialized utilities, socialized medicine and a host of milder reforms were included in the program.

(quoted in Finkel, 1979, p. 157)

This preoccupation with state intervention and long range model-building is resonant with the Parti Quebecois' chronic flirtation with processes of 'planification' in all sectors of society. Michael Young (1958) first coined the use of the term meritocracy to refer to the cultivation of 'politically-neutral' elites selected on the basis of achievement, intelligence and expertise - primarily in behavioral and engineering science. Organized labour either

through the All Canadian Congress of Labour, 1936 and 1940,

the Trades and Labour Congress, the One Big Union, the

communist-inspired ones, with the exception of the latter two organizations all occupied marginal political roles.

Each union tended to dwell on bread-and-butter issues, and economic platforms and was quite defensive about state erosion of their bargaining rights. Although these organizations at one time or another advocated public ownership and the nationalization of resources, each considered the political state as essentially a neutral entity. As I mentioned at the outset, reform and oppositional politics having a reconstructionist thrust were also found in the farm and rural work sectors in the 1930's period. Alliances such as the United Farmers of Alberta and, of Canada, and the Social Credit movement were based on a regional populism and on occasions, radicalism. Their essential protest was buried in a sometimes right-wing, sometimes left-wing reaction to big business and Eastern monopolies that were charged with interest-rate manipulation and trade restrictions and domination over rural, western produce. The populism that farm people and small-scale producers expressed was spawned by the same kinds of structural difficulties all 'underclass' groups faced throughout the 1930 decade. For instance, the possibilities for single men owning their own farm or business were diminishing.

... and the ability of the capitalist economy to provide jobs was clearly in doubt. But workers and farmers held on the illusion

that prosperity would return and with it the opportunity of becoming an independent commodity producer. While the Liberals best capitalized politically on the desire of people to turn back to better times, the success of Social Credit in Alberta shows on a regional basis the illusions that kept people tied to the dominant ideology and suspicious of revolutionaries.

(Finkel, 1979, p. 165)

In assessing the decade of the thirties for the virulence of its cultural oppositions, there is evidence of considerable reflection, and rhetoric, on alternatives to the social-economic arrangements of Canadian society on behalf of industrial workers, farmers, petit bourgeois artisans, small producers and teachers, and progressive intellectuals. How deeply radically these reforms are as cultural and political practices is another question. The period, parallel to the late 1970's and 1980's, was marked by increasing state intervention and sophisticated repression. Citizens took on a variety of responses to the ideologies of reform generated by others or by the state in North America. These responses ranged from cynicism to fatalism to reckless stridency - all seemed inadequate as practical responses to the strategic intrusions of a state consciously sponsoring monopoly capitalist accumulation and stability. The absence of a tradition of political organization and dissent in Canada and the United States is widely regarded as a factor in the chronic stumbling of alternative groups before the prevailing hegemony of cultural practices (see Michael Horn, 1969).

What then were the implications of these political-cultural expressions for schooling in an emergent monopoly

capitalist state? There is little evidence of the formulation of independent schooling ideologies that is not also anchored in social and economic analysis of the wider society. It is in Ontario but primarily in western Canada that school persons, in the decades of the 1930's and 1940's, begin explicitly but to unevenly ground their pedagogy and curriculum planning in variants of progressive or pragmatist philosophy. Historical evidence suggests that school program administrators and teacher educators all were significantly influenced by the promise and innovation of American progressivism and American graduate schools. In the case of Alberta, theorists and administrators, such as Hubert Newland, John Barnett, Milton LaZerte and others instrumental in the provision of public school curriculum, demonstrated a bias toward the progressive organization of the school day. What historical inquiry fails to reveal are the connections practitioners of this kind of curriculum and pedagogy make from social amelioration, industrial or monopoly capitalism and school provisions for democratic citizenships. True to form, the dialectic of educational reform shines clearly in the case of mainstream school practitioners self-consciously adopting the methodologies of progressive education but remaining naive about its philosophical underpinnings or its socio-political outcomes. As Carnoy (1974) points out that as good social theorists of education and curriculum, we are compelled to see the internal colonialism of schools in our society, firstly, and then to carefully situate this structure of relations within the

context of international colonialism. Being a hinterland to the North American empire requires that our analysis of progressive-reconstructionist practices in Canadian curriculum extend internationally and, finally, globally.

Historical research done in the United States (Weinstein, 1968; Kolko, 1963) documents more explicitly that the political and educational movement of progressivism is in direct association with or a direct consequence of the development of monopoly capitalism in North America. These historians disagree with functional-pluralist analysis (Cremin, 1961) and with elite analysis (Callahan, 1962) with their respective explanations on the rise of progressivism since both approaches discount any fundamental relationship between economic structures and political-cultural practices. I have been suggesting, as do Kolko and Weinstein, that the motive force behind the rise of progressivism is the organization of the capitalist mode of production. This is also to say that it is the relation amongst different corporate capital forms and labour, whether mental or manual, which mediates and shapes the political and cultural outcomes of schooling. Kolko argues, as does Finkel in Canada, that progressivism was a voluntaristic policy chosen by large business interests and sponsored by political leaders to further their own class interests.

Economic structures in the United States, to a lesser degree in Canada due to colonial lag since the early twentieth century, have been dominated by monopoly, obligopoly

and the intensification of class conflict. Historians argue that due to this rigidification between capital and labour, the social reform movement of progressivism was spawned. I note that the idea of reconstructionism was but an educational variant. Earlier competitive capitalist forms suggested different social relations and working conditions between and within class sectors. With the development of the monopoly form the working class had burgeoned in size four times in size from 1860 to 1900 by five and one-third million. Work was concentrated in urban locations and carried with it all the caricatured symptoms of low wages, long hours, immiseration. Capital and labour strife increased considerably in the monopoly period to a figure of twenty fold the number of strikes in the mid-nineteenth century. Clearly, the relations between capital and labour had changed qualitatively and quantitatively by the decade of the '1930's' in the United States and Canada.

The kind of reformism which we see renewed today which first attained a sophistication in the 1930's was the notion of a 'harmonious pluralism' of interests. Translated, this referred to the necessity for labour to accommodate itself to the changed exigencies of capitalist mode of production; and to lay down any political or ideological dreams of change and adopt only economic interests in negotiations with capital. As I have shown in the Canadian context, this kind of planning reform was a feature of middle class intelligentsia acting as apologists and retainers of privilege in the opening

monopoly era. More pronounced in the United States was the motif of the organic society and used as a corollary to the harmony of interests between capital and labour. This motif was used as an organizing metaphor for progressive pedagogy and moderate reconstructionist programs with thinkers such as Dewey, Harris, Charters, Rugg and A.S. Neill. It also found expression in the social theory of Cooley, the pragmatic philosophy of James and Pierce, in political theory and economics. These behavioral sciences, as they are termed ideologically, were concerned with the resolution of class conflict through the conscious domination of the state in the social, political and economic processes. Lippman (1943) the liberal political theorist was to write "the substitution of conscious intention for unconscious striving."

It becomes clear that the state's intervention in moulding these conflicts was not to be limited to the political organization of restraint but also was to be an active shaping of consciousness as a means of internalizing this noble harmony of interests for the organic society. Induction into the cooperative principle meant orderly functioning of persons of the the division of labour. Through the efficient planning of the state of all sectors of society, responsibility was assigned the school system for the effective ideological socialization of all classes. Public schooling emerged as a key player in organizing the future economic history of monopoly capitalism. Citizens had to be produced who practised the co-operative principle above merely narrow class or

individual interests.

How do we begin to assess the work of the pragmatists in progressive education? What ought we to make of their language and practices of educational reform - the residues of which are still inscribed in contemporary curricula?

Martin Carnoy argues that John Dewey

called for a change in the organization of work from an orientation to the needs of the economy - that is, the production of more goods - to the needs of the individual or society Dewey wanted the school to provide a period for the child in which he could live and learn without economic pressure, carrying out activities for their intrinsic value . . . internalizing the joy of intellectual experience.

(Carnoy, 1974, p. 254)

I have found Bowles and Gintis arguing that Dewey as an arch figure in progressive reconstructionism was caught by an awareness of the miseries of work under capitalist organization yet not immoderate enough in his social reform. Pragmatism had tended to bind him to the optimization of conditions within the capitalist economy and society so that

the practice of the reform movement was clearly out of step with the democratic and open education advocated by John Dewey.

(Bowles and Gintis, 1978, p. 121)

Seeing some of the strands of progressivism in this light suggests that the practice of this philosophy essentially did not break through the prevailing ideological and cultural relations of monopoly capitalism. It merely 'makes the best of it' and gives the child 'a chance for some time away' from the fracas.

In any deepening critique of progressive education, I am compelled to characterize for future inquiry some central aspects of pragmatism.³ The kernel of this philosophy has to do with the priority of subjective idealism as a constituting force for sense-making. Pragmatism through the idea of the receptive, but active constitutive subject was an instrumental philosophy for a United States in turmoil over class, social and economic conflict. It is important to see this as an intellectual response to a restructuring crisis. Its power lies in evocating through the individual the importance of cultivating community, loyalty and correct belief. The blindness and rampage of socialistic-anarchistic malcontents could be tempered by restoring to all classes the social significance of their lives. The resolution of the labour question, indeed all ethnic and moral fragmentation, could be achieved through pragmatist reforms.

The role of the school was to be a transmission belt for the "community of interests". These had taken on a universalist quality since pragmatism and can clearly be seen as displacing discourse on the nature of class conflict. Children were to see themselves as part of a greater unity embodied in the corporate-civic community. Their welfare was secured in their co-operative, technical or occupational contributions to the community. Public welfare was ideologically synonymous with corporated spirit. We see here the beginnings of the tripartism of 1960's and 1970's amongst industry, governments and labour hallowed by terms such as 'voluntary agreement and endeavor' and the 'planned joint regulation' of eco-

conomic life. The interdependence of particular interest and general welfare has been a dominant societal motif in North America for at least fifty years. It has the character of a self-concealing myth that smacks of a welfarist-reformism difficult for reformers to resist. The call for historical and ideological inquiry has never been stronger.

Classroom social relations, through Dewey and Rugg's methodology, were designed to mirror the social relations of production that exist in the larger society. Methodology, curriculum content and the physical organization of the classroom were intended to reinforce the sense of interdependence with the outside world, particularly the world of work. It is clear that the degree to which progressivist-reformist pedagogy spread in North American classrooms has been associated with the extent of dislocation or change in the social-cultural fabric of regions undergoing economic change, at that time.

The demise of laissez-faire individualism was a necessary step in the psychological and cultural re-tooling of students and citizens in the monopoly era. It was important to cultivate a sense of moral, collective calling within individuals by excellence in work. Individualism, as a personal political force, had to be submerged, only to be thematized by a pedagogy intent on uncovering children's interests for them in the service of a higher social goal. To put persons to work uncritically, and cheerfully, was a task progressive reformers faced. Pedagogy and curriculum theory reflected these political interests through its methodological and conceptual cate-

gories. Achievement testing, intelligence quotients, and tracking policies are cases in point. That the relations of production were mediated by classroom moral and political life is highlighted by the characteristic everyday laboratory school organization and career-vocational education emphases of many public systems on this continent over the last forty years.

It could be argued that moderate progressivism or reconstructionism in North American society sought to dissolve the strident conflict clearly emerging from a society changing in political, economic and ethnic make-up. The interest in constructing a unified ideal community of participants was vital to sustain and stabilize dominant economic and cultural forms in the process of their restructuring. Earlier forms of popular consciousness, concerned with the motif of individual entrepreneurship was dysfunctional for capital accumulation and political hegemony. Individualism required that the state continually intercede to dissolve, cushion or make opaque the presence of class conflict. Habermas (1975) discusses the importance for stable capital accumulation that the state's action appear legitimate and of the role that social science and philosophical knowledge have for this stabilizing function. Other cultural practices under the guise of reconstructionism would be social planning, electoral politics, accountability-competency models, and community school reforms. The tenacity of the faith of popular consciousness in the language and logic of unexamined reform has the effect of displacing

the contradiction of overclass-underclass production and hegemonic relations, through ideological provision, to the level of the subjective self. Habermas (1975) has referred to this as the role of state in uncoupling the economic and political sectors of structural conflict from the social-cultural processes of self-formation. The latter, as a result, has had less tendency to be infused with such conflict as a basis for life confirming motive.

The ostensible radical expressions of reconstructionism in education are part of the common root of progressivism. The strident and radical denunciations of established political-economic arrangements were hallmarks of writers such as Harold Rugg, George Counts, and Theodore Brameld. Virtual contemporaries of Dewey, it is significant for this study that the evolution or emasculation of their thought be portrayed. Their work, and that of their successors in current social education such as Fred Newmann, Harold Berlak, James Shaver and others can be considered as symptomatic of the crisis of hope and identity afflicting programs of reform rooted in the progressive tradition. I will consider the radical reconstructionists and assess their promise in detail as the study proceeds.

3. A third front consists of social structural analysis of the capitalist state, its modes of economic production, accumulation, legitimation and those organic linkages vital to the maintenance of cultural production in schooling; in other words, theoretic

description of political economy of curriculum theory and practice. On this inquiry front, I begin to think about the current form that the advanced industrial state takes in the developed countries of North America and Europe. I do this because the features of the modal form, due to global economic linkages, render the patterns of state intervention and state crises resolution quite similar in different industrial countries. I want to characterize the advanced industrial state because key decision-making structures in the state, through its historical evolution, now have a disproportionate influence on the conduct of everyday life and on the form of cultural practice in schools, to name one agency. Additionally, the nature of the interrelations between the state and civil society has strengthened and complexified in scope during the periods of monopoly and late capitalism. It is important, for answering questions about prospects of utopian reform in social education, to understand clearly how significant a role cultural apparatus have not only as nexi of ideological legitimation but also as real factors in the capital accumulation process. It is not possible, as much as we would like, to separate analysis of curriculum planning and reform, any longer, from a political economy of the state or of society. Inquiry into the political and pedagogical logic of curriculum reform movements calls out, as I have argued, for the ensuing structural descriptions at the same time as it does for collective/self-reflection and historical analysis. My contributions in this section amount

to a taxonomizing of basic attributes of the advanced industrial state and of tendencies of legitimation and motivational crises historically novel to civil and political society (Habermas, 1975, 1971) - as these empirical necessities impinge on efforts in curriculum planning, a dimension of which is this study.

In essence, Habermas (1975, 1970) presents a model of late industrial society wherein capitalism as a mode of production has become "advanced" or "organized". He claims that such a socio-economic formation as advanced capitalism is riven with two primary contradictions: the private appropriation of public wealth and the suppression of generalizable interests. As a successor to earlier monopoly capitalism the advanced formation oversees as much more sophisticated set of relations for capital accumulation by private corporate interests at the same time as the plausible social and political needs of masses of persons are repressed through the action of state, in order that accumulation may proceed in quantitative spiral. (See O'Connor, 1973). Suppression of generalizable interests suggests that economic and political decisions of some importance are accomplished at the expense of not receiving consensus, ratification, or participation whether morally or conceptually by the mass of persons affected by them or their formal representatives. In other words it would be impossible, following the general interest model, that if unrestricted discussion were convened on the validity of such political and economic decisions, by freely

43

associating publics; that such decisions could not withstand critical examination nor be justified. Although the advanced capitalist state reduces such contradictions to technical puzzles, the form of the problem still remains "how to distribute socially produced wealth inequitably and yet legitimately" (McCarthy, 1978). This says that the stability of the capitalist social formation depends upon legitimations or the reproduction of certain cultural forms.

The type of social and political analysis conducted by critical theory is rooted in a Marxist tradition. Assessment of the conditions of social reality or moral consciousness is gauged, for Habermas, against normative ideals that individuals and social forms can attain given their stage of historical development. The other limiting conditions, against which societies and individuals struggle, are forms of political coercion, ideological residues, ignorance of the conditions, and scarcity of resources. At any one time critical theory can express, through its analyses, a normative position which acts as a type of criticism.⁵ This analytic criticism pre-supposes ideal or counterfactual, normative standards resident in the ontogeny of the human species and in the social and cultural forms that either express underdevelopment and redundant expression in a social formation, or, which would express attainment of an historically necessary state that has been reached. This claim can be made for stages of personal enlightenment, as well as for the organization of political, cultural and social life.

A legacy that Habermas inherits from the Marxist tradition is the notion of historical necessity wherein humanly constituted structures possess an innate tendency to renew themselves to higher or more self-sufficient forms through creative or inventive praxis. I am not suggesting that this tendency allows historical prediction or events, catastrophes and intellectual developments but merely to say that the moral dialectic of human activity works itself out through an empirical unfolding.

I discussed the idea of crisis tendencies, in an earlier section, that was concurrent with the rise of laissez-faire but more particularly monopoly capitalism. One of the revisions of critical theory's neo-Marxism has to do with explicating crisis tendencies in the advanced capitalist state. As a result of historical explication, Habermas argues that the particular crisis tendencies that are identifiable are no longer situated in the economic sector of the society but in its socio-cultural practices. These crises do not concern the reproduction of economic or material conditions directly but are concerned with "the reproduction of reliable structures of inter-subjectivity" (McCarthy, 1978). Hence in distinction to classical Marxism there is with critical theory a dynamic interdetermination of structure with superstructure. Habermas, in reconstructing theories of social evolution, relies on his parallel distinction between labour and interaction.

Advanced capitalist states exhibit, according to Habermas, a set of four distinct types of crises. These are crises of economic reproduction/accumulation, crises of state and institutional administration, and crises in the requirements for legitimation, and crises of social motivation. Given the complexities of advanced capitalism it is difficult to anticipate the particular probabilities of any one crisis or combination occurring. Due to the displacement of conflict from the economic to the socio-cultural sector, one could argue that crises could precipitate of a legitimation or motivational nature and are more likely in the late twentieth century state. Crises of the last two types and a possible coupling with an administrative deficit are the most generative of escape routes to capitalistic self-transcendence. Consciousness effectively mediates participants' chances of reconciling their interests in any alternative social and cultural forms they may seek. The notion of a "truth-dependent mode of socialization" refers to having persons' life experiences still structurally connected to areas of reproductive decision-making so that any norms of meaning a community generates still have an impact on their most basic life-dependent actions. In other words, the "truth-dependent mode" permits a critical assessment of consciousness and meaning structures - as to their essential or apparent qualities - and their contributory possibilities for personal and collective transcendence.

Historically speaking, each social formation that evolves

from one major mode of production to another, also generates, partly prior and after, structural transformations or shifts in what could be called dominant forms of consciousness, traditions of knowledge, and personal meaning structures that account for, sustain, legitimize and criticise existing political-economic relations. If the "organizational principle" of a society limits the resolution of problems through knowledge or practical activity, attendant problems of social reproduction could precipitate a crisis of social integration. To the degree that social consensus is brittle, fragmented or absent, crises of legitimation or motivation under such conditions could occur. In earlier capitalist forms the organizational principle is "the relationship of wage labour to capital anchored in the system of bourgeois law" (McCarthy, 1978). In liberal capitalism economic exchange or the illusion of the market mechanism is the means of social integration. Through the universalist bourgeois ideology of equivalence exchange, it is given a home in the dealings of the market place. The latter becomes a final arbiter of conflict in society. What is not appreciated is that class relations have become institutionalized in the market effectively depoliticizing them for the time being.

In examining advanced capitalism the organizational principle has changed. Factors that affect this are the vital interdependence between the economy and the state. The latter also engages in global planning wherein capital investment, capital utilization and capital guarantees are made. Amongst

the multiplicity of its functions, the state intervenes in the cultural sectors such as education, school planning, program development and training wherein not only 'labour productivity' and long term capital accumulation prospects improve but legitimation and hegemonic functions are sustained. In essence, what occurs is that with state intervention in the processes of labour reproduction and accumulation, there is a corresponding production of "collective commodities" (both material and non-material, social, political and economic building blocks). These "collective commodities" comprise the kinds of pedagogic, curricular, intellectual and attitudinal outcomes that develop through educational practice, and through scientific-technical practice. Each sector addresses the twin functions of ideological maintenance and economic reproduction.

As a result of developments in the advanced capitalist state, too complex to broach at this stage of the inquiry, the organizational principle of the society has become one of "quasi-political" compromise between business and unions determining the cost of labour power. As McCarthy indicates

the unpolitical relationship between wage labour and capital and the autonomy of the economic sphere vis a vis the political, have given way to a "quasi-political" distribution of a social product and to the assumption by the state of market complementing and market-replacing functions.

(McCarthy, 1978, p. 365)

The state is faced not with the certainty of economic crises but with threats to the plausibility of its actions.

If it fails in its administrative rationality there is a likelihood of displacing this threat to a more general level of social approbation - that of system-wide legitimation.

The state apparatus, in its manifold effects and relations, has become the agency of social integration in this era of advanced capitalism.

As I have argued, the need for legitimation "commodities" and resources of meaning are important for the unproblematic operation of everyday life in the advanced countries. The meaning deficit which can become acute, as a problem of social maintenance or mass loyalty, occurs historically since equivalence exchange or the 'natural justice of the marketplace' has lost its ideological and hence integrative functions for social life. It is generally acknowledged (Offe, 1972; Castells, 1980), that social rewards, social wealth and prestige are distributed in large measure through political negotiation, pressure tactics and as outcomes of particular government policies.

(This is certainly accurate for the experiences I have had in curriculum planning projects across three provincial jurisdictions in Canada). But, concurrently the capitalist mode of organization has not withered away nor become obsolescent. Profit maximization and accumulation, although central as dynamic principles in the organization of economic reproduction, cannot command a taken-for-granted existence as modes of operation in the advanced societies. Consequently, there is always the prospect of a legitimation deficit that requires constant cultural

infusions in the way of "substitute program(s)". Habermas characterizes these contradictions nicely and points out the outcomes for citizen understanding and participation:

Recoupling the economic system to the political... creates an increased need for legitimation. The state apparatus no longer, as in liberal capitalism, merely secures the general conditions of production... but is now actively engaged in it. It must therefore... like the pre-capitalist state... be legitimated, although it can no longer rely on the residues of tradition that have been undermined and worn out during the development of capitalism. Moreover, through the universalistic value system of bourgeois ideology, civil rights - including the right to participate in political elections - have become established; and legitimation can be disconnected from the mechanism of elections only temporarily and under extraordinary conditions. The problem is resolved through a system of formal democracy. Genuine participation of citizens in processes of political will-formation, that is, substantive democracy, would bring to consciousness the contradiction between administratively socialized production and the continued private appropriation and use of surplus value. In order to keep this contradiction from being thematized, the administrative system must be sufficiently independent of legitimating will-formation.

(Habermas, 1975, p. 36)

The significance for my discussion of conventional educational reform should be clear. If citizens' real interests are, in fact, separated from the access to or influence upon centres of decision-making and if these civic interests and practices are lodged in a hollow, formal kernel of democracy, then radical reform efforts must address both a chronically false consciousness and the basic contradictions of socio-political life in the advanced societies. If the public realm is still conceived by curriculum planners as a traditional

institutional forum for solving grievances, for publicizing issues, and for applying leverage to dominant societal sectors while empirically it is a way of getting people entangled with one another, defusing dissent, and connoting to reform-minded persons that they in fact have tried and acted politically, then the depth and sensitivity of critique to society-curriculum problems must be significant, sustained and collaborative.

Habermas has argued that what accompanies legitimation maintenance is a structural manipulation of motivational, and socialization patterns of individuals. Marcuse (1964) has shown that accompanying the emergence of the state-industrial complex is the tendency toward manipulation of human needs, interests, relevance structures and recreation. The kinds of content that embody socialization and recreation relations presently accentuate "civil privatism", "familial-vocational privatism", strong career and leisure orientation, and a sense of achievement at being a 'smart operator' within the system. Lifestyle and world view shift toward the 'naturalness' of pursuing strict self-interest. As the public sphere is depoliticized, the distortions or damage done to human practice is projected through to human intimacy and care. Political repression, unconsciously undergone at the level of public life, often emerges in a distorted, vengeful way within domestic and leisure relations. Hence extreme narcissism and the sadism of gender relations is often exhibited. Techno-

logical ideologies are effective substitutes meaning systems for suggesting the 'correctness' of these lifestyles. Such ideologies act to foreclose much critical debate and community political expression that would act to counteract tendencies to motivational rationalization. That there are gaps in civic or public expression for "discursive will-formation" is clear. Traditional erosion of organic individual and community bases of creative will and praxis may only proceed so far. Pinar (1981) argues that one baseline for political renewal is in the re-discovering and celebration of alternative gender relations. For our purposes curriculum planning in recovering its self-consciousness as a human practice is one instance of resistance to the administration of rationality and motivation. Curriculum work can make public and thematize prior taken-for-granted with the effect of 'stirring-up' spuriously settled cultural traditions. If curriculum work can be historicized sufficiently for an awareness of how lifeworld and formal cultural content is mediated, both technically and organically, then curriculum work becomes a motive political force - a full consciousness of alternatives. In the final analysis:

There is no administrative production of meaning. The commercial production and administrative planning of...symbols exhausts the normative force of counter-factual (ideal) validity claims. The procurement of legitimation is self-defeating as soon as the mode of procurement is seen through.

(Habermas, 1975, p. 70)

What would some of the cultural resources be for those of us who work in the reproductive sectors of curriculum and

schooling? Habermas claims that remnants of bourgeois tradition and science can contain affirmative, discursive, and transcendent functions if those who work and participate in these forms are assembled together in communities of interest. He refers to much of modern art, to scientific practice (in the way of natural science and philosophy), and to universal morality. Educational workers are particularly sensitive to the accretions of the latter two kinds of conceptual-moral practice. We are often too ready to reject the debunking and motive-forming power of logical positivism, analytic philosophy, and methodologies of physics and biology. The elaboration of moral philosophy, moral development and values education, in themselves, offer no practical route for self-transcendence but do demand a particular kind of justification of decisions-taken, research produced, and grants procured in the intellectual, civic and governmental sectors. Even traditional curriculum practice can restore a sense of human interest to our development and evaluation activities as it often casts up a pictograph of the good life that, once re-thematized, can be understood. Pedagogy, at times, does speak to the deep sense of care and community that grounded the conservative *gemeinschaft* of prior historical eras. When persons who remember this remind others of moral-practical dimensions lost or restored they also pose the question that asks where are we as persons heading collectively - whose interests am I preserving and ought I to build on the routines of opportunity and condition that are channelled my way? In many respects this is the perennial Canadian question of

whose bidding are we going to do? What other culture or person's history am I living through? "Often we substitute someone else's past and present for our own - a form of insanity" (Salutin, 1982). It is important for informal or particular projects of inquiry to remember that these cultural domains, with political organization, can mobilize effective motive formation and identify re-integration precisely because they are dysfunctional as alternatives for civil privatist neuroses and hence system maintenance. That sense of revelatory release that can accompany the fraternal awareness of one's global interdependence and of sharing particular and general interests with different ethno-cultural groups, each jointly oppressed, is indicative of human praxis.

In thesis three on his excursus of the anatomy of motivational crisis tendencies, Habermas begins to link up the possibilities of moral development, its elaborations, and the structural relations of advanced capitalist political-economics. Barely stated, he is concerned with the widening gap between the labour, capital and planning requisites of ever-spiralling accumulation needs and their variance with the normative expectations for personal efficacy, prosperity, and moral-familial anchoring. I cite both Habermas and McCarthy as a way letting them draw out the implications for a renewal of civic competence (in the advanced societies).

1. As long as we have to do with a form of socialization that binds inner nature in a communicative organization of behaviour, it is inconceivable that there should be a

legitimation of any action norm that guarantees, even approximately, and acceptance of decisions without reasons.

- 2. Since liberal capitalism, the need for legitimation of norms can be met only through to universalistic value systems.
- 3. Today, the only form of universal morality capable of withstanding the destruction of tradition is a communicative ethics in which all significant decisions are tied to the formation of rational consensus in unrestricted discourse,
- 4. The basic elements of a communicative ethics are today already influencing typical socialization processes in several social strata, that is, they have achieved motive-forming power.
- 5. As a result, the privatistic motivational patterns essential to formal democracy are threatened with disintegration, a threat that can be documented in the spread of withdrawal and protest syndromes.

(McCarthy, 1978, p. 376)

A REVIEW OF THE PROBLEM OF REFORM IDEOLOGY

At this point I would like to review briefly what some of the structural changes in the state mean for educational provision in Canadian society and how the reform rhetoric of progressive-reconstruction is instrumental in doing state-corporate sector bidding.

In my journey through the progressive terrain in the United States and Canada, I have argued that despite the semi-autonomy of cultural forms such as schooling, the career of reforms must be understood, in part, as the working out of the contradictions of capital and labour through successive shifts in the organization of economic or material reproduction. Despite the particular reforms directed to subordinate ethnic and social classes in this country, and the resistance

to these reforms or their incorporation by them. The focus of these struggles has been, it could be argued, a strengthening of social control over the direction of political-economic arrangements; this truly becomes a dialectic of educational reform in its own right inscribed within the broader capital-labour or social-cultural dialectic. Countless instances of school baggage, accepted at face value as inherently virtuous, such as the integrated day, individualization, activity days and extra-curricular options, interdisciplinary curricula, children's rights, and psychological testing seem, in the long run, to confirm the school's role in the stratification of class, ethnicity, competence, care, and world view. Bowles and Gintis (1978) indicate that despite the brilliance of Dewey's methodological devices in schools he neglected the political-economic interests of a class society that his advocacy sustained.

Some revealing examples of how educational planning has fused reform and control lies with provincial educational bureaucracies across this country where it seems the legitimation and accumulation needs of a social industrial complex are being serviced at a provincial-regional level, given the constitutional division of fiscal and other responsibilities. British Columbia, Alberta, Ontario and Quebec provide fine instances of senior level functionaries trained in graduate institutions imbued with the spirit of progressivism. In these places, we discover individuals surely cognizant of the commercial, manpower, and capital needs of corporate interests developing programs of reform that emphasize, nominally, skills of auton-

omy, and decision-making for public school students. Upon closer examination I found such curricula provided little in the way of personal freedom, thorough or radical opportunities for inquiry in social change - nor a particular appreciation for the sediments of classical thought. The highly structured formats of programs of inquiry in the social studies are best seen, impressionistically, as modes of reformist response to social discontent. They lead essentially, if ever implemented, to personality reformation of the type Bernstein (1971) calls 'flexible, conforming, generalists' of late twentieth century urban culture. Such future citizens are being prepared for participation in the service, extractive, and industry sectors of the New Northern Jerusalems; places such as Alberta, Texas and Florida. It is interesting to note the conceptual parallels between curriculum policy documents rationalizing the new Enterprise program in the Alberta of 1935 and the kinds of pedagogical and social studies of the period 1967-1975. Other parallels can be seen with the rise of the Social Credit and C.G.F. movements in the 1930's and their political homologies in the late 1960's and 1970's with the resurfacing of trade unionism and the N.D.P. both in Alberta and Ontario. This chain of reformist cultural commodities parallel the economic restructuring associated with the emergence of monopoly capitalism in different continental regions in the 1930's and the second structuring of organized capitalism in Canada, and globally, in the mid 1960's - 1970's period.

Schecter writes on the economic-occupational shifts

57

that had an impact on the kinds of school and curriculum provisions organized:

...not only the final transformation of the (Canadian) economy to industrial capitalism but also a shift in its internal composition; the growth of the tertiary sector, an increase in the white collar proletariat, the integration of significantly more women into the labour force. Between 1941 and 1961 the white collar component of the labour force increased from 25.2% to 38.6% while the primary occupational group declined from 30.6% to 13.1%... Professionals accounted for the second biggest increase in the white collar sector, while the percentage of self-employed professionals declined. (Schecter, 1977, p. 398)

Clearly, as Habermas (1975) and O'Connor (1973) point out that as the state-corporate sector factors of production shift so must the problems of labour preparation and legitimation. Shifts toward the service industry and away from the primary or secondary industry also require a shift in the monitoring and control functions for these occupations in the corporate work day. Reliability, flexibility of skill and attendance patterns, and increasing fragmentation of the work regimen suggests that social relations of pedagogy and curriculum are re-negotiated. This is not to suggest a determinate correspondence between the content and process of schooling and structural change. But if schools were to prepare willing, secularized production factors for service jobs and industry, that would mean participants would have to accomplish school outcomes differently. It also suggests that the dialectic of resistance would change as well in a

58
state restructuring from a labour-intensive competitive sector to a capital-intensive monopoly sector. Problems of legitimation and motivation can reach crisis proportions when large numbers of persons become unemployed or unemployable as a result of structural transformations. Concurrently, these phenomena can represent alternative perspectives for understanding such complexes as regional underdevelopment, work and achievement, and the state determination of persons' life chances.

What can we see, then, of the concrete shifts in the organization and realizations of the school program at the level of motivational patterns and understanding in students? Habermas has argued in his more recent work on communication theory (1981, 1979) that, generally speaking, the dominant mode of socialization in our society is primarily responsible for persons' willingness and capacity for action in the world. He also argues, as does symbolic interactionism (Mead, 1934), that socialization is possible because of linguistic structures generative of intersubjectivity. He suggests, for all practical purposes, that individuals act on the basis of norms that require discursive justification or with the expectation that cultural, political, social norms that they act through could be justified if they took the time to bother. Our actions, at the same time, are an interpretive practice of these norms, meanings, symbols and gestures. The significance for those of us working in curriculum is particularly acute for:

This communicative organization of behaviour can become an obstacle to complex decision-making systems. As long as we have to do with a form of socialization that binds inner nature in a communicative organization of behaviour, it is inconceivable that there should be a legitimation of any action norm acceptance of decisions without reasons.

(Habermas, 1975, p. 43-44)

Clearly, the school as an organized activity mediates life in the socio-cultural sphere so that secondary socialization changes can occur through re-arrangements of classroom teaching and learning. To the degree that this is sufficient, extensive, and plausible, the psychological parameters of student personality development can be altered. (This is virtually axiomatic for anyone having been processed through the public schools). The redefinition, even subtlety, of knowledge forms and role requirements of students associated with the 'deskilling' typical of intermediate, secondary and vocational schools can produce a serious erosion of critical capacities in students. The practice of guidance counselling parallels Bernstein's 1971 admonition that the effect of integrated curriculum was primarily that of greater personal intrusion of institutionalized pedagogy within student consciousness. This had the effect of making more personal, subjective content available for institutional scrutiny. Social control through the reification of students' consciousness reflects shifting organizational patterns of economy and morality in the wider society. Under the guise of greater understanding, interpersonal contact, and 'socially relevant advice' for career planning these practices

are constituted. If students' subjectivity is more accessible to school curriculum workers without a corresponding rise in students' competence in standard and classical literacy and analysis skills, they are more prone to being buffeted through the institutional corridors of efficiency. Deskilling often accompanies a resurgence in interest in career education. Marvin Lazerson (Grubb and Lazerson, 1974) has revealed the adaptive function of vocationalism in schools throughout the twentieth century in North America. The primary effect of such soft techniques as integrated curricula, humanistic guidance, de-skilling toward more 'fun' courses, and the harp on vocational preparation seems to be to dissolve the "expectational framework" students could legitimately hold. Dissolving their expectations concerning future life chances and societal opportunities, reconciling them to their 'natural level of interest', is akin to rendering students senseless into what I could call the culture of narcissistic silence. Structurally, the impact of these programs is to re-integrate future citizens into changed horizons of work and expression - that is, the logic of economic reproduction. I find Habermas is able to sanction these possible psycho-political consequences of schooling:

Only if motives for action no longer operated through norms requiring justification, and if personality systems no longer had to find their unity in identity-securing interpretive systems, could the acceptance of decisions without reasons become routine, that is could the readiness to conform absolutely be produced to any desired degree.

(Habermas, 1975, p. 43-44)

4. A fourth front of this inquiry consists of practical, conceptual, but speculative analysis of current manifestations of critical or reconstructionist social education and their utopian promises. This subject is couched in an essentialist reading of the material, cultural and axiological requirements of citizens living in late global capitalist economies. I argue for the kind of organization of curriculum practice generative of democratic publics. That is to say, this inquiry front of the study is explicitly a normative excursus.

CURRICULUM STUDIES

In returning to the interest of political normative bases of curriculum reform, I shall provide a few thoughts on the direction the field has taken historically and intellectually and what requirements of community are called for in the recent language of reform.

It is clear that if curriculum theorists, as a community, have been intent on re-examining themselves over the last decade, so has the state been re-examining its commitment to education. As I, Willis, Habermas, and the progressives have argued, organized public education is a primary device for societal social and economic reproduction. As O'Connor and Habermas demonstrate, schooling is a means of increasing capital accumulation partly through direct economic growth and partly through the preparation of consciousness and labour power. The state, in the advanced societies, operates in sophisticated fashion as an entrepreneur of social and moral

ideologies and articulates these through symbolic structures related to notions of equality of educational opportunity and social condition. To some extent the plausibility crisis in society has occurred because of the contradictions between ends and means of achieving the 'good life'. In other words, organized state efforts and the empirical outcomes for people have lost some of their plausibility. Clearly, these crises are due to the human frailties behind the social, cultural and administrative devices that mediate meaning content and concrete life chances but also due to the ineluctable contradictions of an advanced capitalist society. As a result there is a certain urgency in having to alter, refine or repair the content, control and outcomes of the school curriculum. As always, in a social formation these socio-cultural repairs are met with resistance and challenge on behalf of citizens, teachers, students and other affected participants. One of the least debated themes surrounding public curricula has to do with who should hold the power to make, oversee and assess the changes in the selections from our cultural traditions and future.

Traditional curriculum research has tended to avoid the systematic or peripheral thematizations of questions of power and control, of the economic and social contexts that condition our curriculum work whether development, evaluation or theory. The history of curriculum research has shunned a mature examination of the relationship between theory and practice that has troubled unself-conscious state decision-

63

makers. I will argue that traditional curriculum research is practically and intellectually incapable of doing the kind of philosophical, social and educational analyses of structural questions that must be done, if it hopes to address felt-practical issues, questions of reform and change, or to achieve self-understanding of its own works.

One of the pre-occupations that curriculum as a field of the practical must address is the dialectic of resistance and change and the way levels on which this practical relation is reflected. Teachers, students, planners and other citizens can be portrayed as active in confronting contradictory experiences at a theoretical level. They can be seen as fully inhabiting this domain. What is not portrayed as frequently is how teachers, learners and planners reproduce themselves, in antagonism, at their places of work with colleagues and peers in trying to work through theoretical contradictions. These immediate contours of intimacy, of dread, anxiety and self-doubt, combined with a sense of personal possibility must form a part of the inquiry of curriculum research. The cuttings of structure and circumstance impinge profoundly on curriculum work as we try to deal with purely methodological or pedagogical projects. The kind of working protocol that emerges as a negotiated order of professional settings must be examined not only for its formal qualities but also for its symptoms as a subtext of conflict and resistance in the reproduction of social life. This, too, is a research agenda for curriculum workers.

The twin concerns of curriculum theory can be considered as those of self and structure or the indeterminate connections between institutional ensembles and intimacy, between the force of historical sediment and the resistance of organic communities, between nature and culture, and between the saturations of state-sponsored hegemony and the refreshing qualities of cultural alternatives. Curriculum theory, in order to understand itself, its subjects and to submit to its warrant of theory-guided action, must situate itself intellectually as a movement and intimately as persons, in spite of their petty acquisitiveness, in the midst of these dangerous dialectics. Curriculum practice, to survive as a voice with power, must be organized by communities of teachers, theorists, learners, and participants interested in on their own revealed interests and enlightenment. The alienated power lying behind managerial-style, needs, and interests can be dissembled as curriculum study becomes a relational, radicalized, explanatory and practical affair; the community which throws off the ahistorical, asocial empiricism and redundant scales of scientistic curriculum-making. As structural change accompanies character re-integration, a revitalized curriculum study must be concerned with a "sense of audience". Relearning to write and to talk with one another who inhabit formerly strange constitutencies is, too, a means of validating new research claims. In a collaborative system it is important to understand the dilemmas and positions of strategic others, easily isolated, through their own

projects of renewal. It says that in work

...men must accept their own unique talents and varying ambitions as authentic... they must consider the possibility that their personal impulses and special talents have as much right to be heard as the cultural norms.

(Gouldner, 1976, p. 320)

Curriculum theorists would do well to re-imagine themselves as Schutz' stranger whose "local ignorance is related to the fact that (he has) access to another body of knowledge, a knowledge of the surrounding but distant world." (Berger, 1973). This strongly precious self and situational knowledge of others and of their biographies complements our generalized knowledge of mere global spaces.

In making my way with the reader on this excursus of curriculum reform, I am implicitly suggesting temporary endpoints of practice to where we might head as theorists and as citizens bent on enlightenment. I have hinted at the kinds of knowledge that we could reflect with and use strategically. I have been more circumspect about the mechanisms or devices that can correct us as living persons in 'intentional areas' that project our future moral, social and pedagogical states. In some ways I have refused to divulge these generative recipes to curriculum theory circles because there are not any recipes, equally because there are not any to my knowledge, and finally because I find it one of the most difficult things I have ever had to do. (To ensure that all this concern, that all this heat and light is justified in trans-

forming curriculum practice, and that I, too, have not forgotten myself in a daring-but idle dream of prestige this picture needs to be allowed to stand as a reminder of the state of our field.) How close to the courses we might teach this is;

We are back in the introductory curriculum class in an American university. Gone is the Greek insight that theory is the cultivation of point of view, of transcendence of practical affairs, and that practical knowledge is knowledge in its own right (Lobkowitz, 1967, p. 118), imperfect but necessarily so. Gone is the notion that contemplation is essential to the cultivation of wisdom; gone is the Christian view that good works follow from faith. Present is the demand for knowledge of circumstances not yet present, theory which controls the future as it anticipates it. Theory is no longer achieved through distance from human affairs; it has become a mere appendage to it, judged and justified solely according to its ability to predict and control those affairs. It is little wonder that elementary curriculum students demand such knowledge; they merely reflect the view of theory and practice which prevails in a scientific age.

(Pinar and Grumet, in Lawn and Barton
1981, p. 26)

The authors, in sum, have described the history of the curriculum field with its minor and major transformations beginning in 1920 to its first chronic reconceptualist convulsion in the early 1970's. This convulsion was a necessary, health-provoking one as the conceptual and political upshot was the re-assembly of a complex curriculum community - one that was dissipated for forty years in its role as puppet and magician for the logic of several years of capitalist re-entrenchment that we see named as banking educa-

tion (Freire, 1973) or as the agricultural-technical model (Hamilton, 1977) or linear-technological rationality (MacDonald). From the heydays of conservative and moderate progressivism in the 1920's and 1930's, curriculum thought had taken an onward tumble to a 'dialogue of beautiful souls' where representatives of a variety of life-adjustment programs or plans dismissed conflict and performed cheap compromises with one another. The greater project for curriculum theory collapsed into a shabby psycho and sociological reductionism. The reconceptualist turn-about beginning in the early 1970's under the auspices of people such as Bernstein (1971), Schwab (1969), Huebner (1979), MacDonald (1975), Aoki (1975, 1978), Pinar (1974, 1975), Apple (1979), Van Manen (1975, 1980) embodied a celebration and potential for organization that curriculum studies could not ignore. I close this section with a fine crystallization of the power of reconceptualism:

... (theory), then, is a critical exercise, descriptive rather than prescriptive, studying signs of educational practice.... It presses back the categories of learner and curriculum to the relations that bind a person to his or her particular cultural, historical and political situation and then dissolves that person and that setting into the ineffable possibilities... of the individual making a home in the natural world.

(Pinar and Grumet in Lawn and Barton, 1981, p. 38)

THE ORGANIZATION OF ENLIGHTENMENT:

CRITICAL SOCIAL SCIENCE

The Yugoslav social theorist, Mihailo Markovic, writing

in 1974, is illustrative of recent work contributing to the growth of modern, critical social philosophy in line with the tradition of Marx, Lukacs, Gramsci, and the Frankfurt School. (see Fay, 1975; Slater, 1977). He claims that the focus of this tradition of practical philosophy is on crucial contemporary 'social issues' in order to demonstrate

...the profound crisis of existing forms of contemporary industrial society.

(Markovic, 1974, p. 94)

We are urged to examine the philosophical foundations of critical social theory as a means of exploiting the possibilities out of a cultural and political 'impasse'.

Critical social philosophy attempts to integrate social theory and political practice as ongoing moments of its practical inquiry. It views theories as analyses of a social situation, in terms of those features of it that are perceived alterable, in order to eliminate certain frustrations its members are experiencing. The success or truth of a theory partially consists of determining the theory's relevance in leading to a satisfaction of human needs and purposes.

For critical social theory:

...what is to count as truth is partially determined by the specific ways in which scientific theory is supposed to relate to practical action.

(Fay, 1975, p. 103)

In other words, critical social theory is concerned with how knowledge trans-

6
lated into practical conduct and with how action is a constitutive element in knowledge constitution, per se. The normative validity, then, of critical inquiry is tied to how well theories translate into action, to whether its knowledge claims concerning social and psychological reality lead to states of human progress, and to whether the claims of influence and causality are made meaningfully transparent to the concerned with a number of joint tasks that include classification of conceptual traditions in linguistic communities - particularly those statements concerned with the fundamental structure of reality, cognition, man's nature and the type of society we should seek to build.

Critical philosophy, as a product of human practice, is seen as a rational inquiry preoccupied with uniting human desires, visions and aspirations with a global awareness of the 'IS' of the social, historical world. Critical social theory features a dialectical method that orients one to seek the solution of social problems by discovering the basic limitations of extant social forms and by indicating alternative, more rational, human historical possibilities of social organization. This method, ideal typically, incorporates descriptive and understanding functions of man and the world at the same time as it engages in synthetic, critical activity.

Hence, a critical social philosophy is seen as a practical activity that embraces the instrumentalities of positivist uniformities and predictions and, the idealism of utopian radicalism in a radical project that contains a

knowledge of reliable social tendencies which plausibly lead to a vision of new historical possibilities. Critical social philosophy as theory and as practice must not be reduced to an enunciation of what is or what might be but also what ought to be as forms of the significant expressions, understandings and conduct of human groups.

In another essay written in 1972 Markovic argues for a deepened sense of social responsibility amongst scientists and technologists concerning the practice and outcomes of their research. He exhorts social scientists in particular to steer away from a self-image as "producers of information who neither care about the basic goals of inquiry and about the broader context of knowledge within which their intellectual products acquire final meaning", or who as scientists are disallowed from "participating in the decision-making process about the use of these same products" (Markovic, 1972, p. 1). What is needed following the lives of a critical social philosophy is a 'concrete historical universalism.' Science is encouraged to recognize the importance of a global community that has the two-fold task of publicly calling-out its analyses of social injustice, contradiction and environmental degradation and of securing the conditions of personal freedom from vulnerability to state intervention. Such conditions of individual and collective autonomy are related to transformations in individual consciousness and in lifestyle in order that autonomy and identity are given a less-threatening base upon which to flourish. As in any

systematic tradition of inquiry, critical social science has a latent image of pedagogy and publicism that permits the transmission and regeneration of this knowledge and practice for a new class of scientists and teachers. I note seven pedagogical elements that stem from this tradition of critical practical inquiry:

1. Placing content into broader contexts that show the connections, mediations, historical location and psychological conditions under which the knowledge originated.
2. The creative interpretation of knowledge wherein is expressed a new meaning or personal philosophical outlook.
3. Awakening the intellectual curiosity of students, broadening their spiritual horizon, developing their capacities for critical thinking.
4. A scholar must possess personality, being not only a man of knowledge and culture but also a man of integrity and character who is actively committed to the realization of his beliefs.
5. In his calling the scholar will extend his activities beyond the relatively narrow, academic circle and become an active figure in the global community.
6. Such public activity is an important link in the process of mediation between theoretical mind and concrete praxis of a society.
7. The scholar-teacher has the opportunity to influence the course of the most important social processes in a double sense: on the one hand by his direct action, on the other hand, indirectly, by educating those who will change the world. (That is, simultaneous change of external conditions and self-change).

(Markovic, 1992, p. 11.12)

I have encountered and used several texts in teaching curriculum methods courses in the last three years that begin to embody the normative and pedagogical scope necessary for critical study - as Markovic and to a lesser degree Habermas have outlined. The texts and illustrative pedagogy were used then within a number of course formats for senior undergraduates and graduates in teacher education. Clearly, the particular course objectives and structures mediated and carried illustrations from these texts, essentially dealing with character and structural criticism, to a level of pedagogy that matched the social experience and personal horizons of students in each of the courses. To extend these experiences of pedagogy in the courses to the full-blown political potential of the original authors would have required a longer period of psychological and cognitive incubation within these projects. Important data for my practical inquiry into the utopian potential of critical social studies or reconstructionism are those of the course outlines, assignments, activities, and the transcripts of interviews conducted with each of the students. Such symbolic and oral material will act as critical subtexts for the first self-reflexive inquiry front of this study. I cite the following as particularly, generative texts that I have uncovered and used:

Harold and Ann Berlak: Dilemmas of Schooling: Teaching and Social Change, Methuen, 1981 for Education 5067 School and Society. University of New Brunswick 1981-82.

THE PRACTICAL METHOD

In what follows I borrow extensively from the sociological work of Habermas (1971). I use this work as an analogue to the kind of organization of the study that I would see occurring at a meta-level of practice. It is an analogue to the kind of pedagogy critical social studies could comprise of, if teaching and learning were organized within the parameters of a community of critical social science. The theoretic and practical device I outline is stipulative of the organization of curriculum planning only in a general sense. As such it is tentative and preliminary and is part of the generative text that the four different fronts of inquiry contribute to the analysis of the problematic of this study: "What are the Stipulative Prospects of a Critical Social Studies in the Late Twentieth Century State?" Given the fact that the composite method of the study should be considered as an ongoing dialectic of historical, structural and self-analysis, the organization of the study is itself a datum which will be identified. The final authority for the interpretation of the practical

method analogue and for the study as a project-in-accomplishment rests with the reader, his/her own convictions, and the strategic action this relationship may or may not convene.

Habermas has devoted much of his 1971 work to the question of enlightenment or the acquisition of critical awareness and the organizing role that social theory has in mobilizing insight and action in participants. Habermas likens the process of enlightenment with that of psychoanalysis. In the clinical situation the patient or participating subject engages in self-reflection of subjective and objective experiential contents that have been reformulated for him by the physician, so the probability of self-insight is heightened. Self-reflection as a moment in the process of critical enlightenment "can be conceived as the internalization of a therapeutic discourse" (Habermas, 1971, p.28). The patient and physician of the psychoanalytic setting can be likened to that of partners in discourse. If speech is not to become merely analytic but reflective and generative, the participants in a discourse may start in asymmetrical relationship. If true consensus and enlightened communicative action is to be achieved, these positions by the conclusion of the discourse must become interchangeable and egalitarian. This structure of speech that evolves between participants affected by an issue is the only guarantee, Habermas contends, that the interests of all affected parties are secured and become the general interests of the group, or institution or community.

In a discussion of the role of the political party for

the organization of the class struggle as follows: there is but an indirect connection between the dominant and the subordinate elements. The clarity of situation and striving towards the role of the (communist) party, in this instance, supervising a partial pedagogical function. The model of situation-free communication and the encouragement of self-reflection act as arrangements to guide concrete individuals in a person's past and future activity, and to dissolve their political barriers to communication. Authenticity in participants' self-relations and relations with others is one monitor of the "truth of the interpretation" derived by the physician, the party, the pedagogue or specialist. Equally, the insight-laden theory used by a participant should instead be retained simply as a perspective that can be close, objectively, the correctness of the socialized process of reflection being undertaken. That is, does the objectivating theory disclose aspects of the world for me that are apparent for others through their processes of self-reflection? When objectivating theory is used only as confirmation of empirical events, the enlightenment calculus is reduced to the possibilities of confirmation that flow from scientific discourse. Confirmation of the truthfulness of insight attainable only through interpretive self-reflection is thus stymied. As Habermas says there are two kinds of social relations that can lead to rationality; namely, the level of theoretic (scientific) discourse and the organization of social relations that employ the sci-

procal of this and use reflexive theories as a connective device between self-group-and-society in a situation of interest to the participants. Objectivating theories anchored in scientific discourse can contribute indirectly to enlightenment as discourse situations in which norms of equality, truthfulness, comprehensibility and plausibility can be assured. Participants in this kind of situation are at least given the opportunity to radically analyze or taxonomize the social-political world. A revolutionary posture is more common from this kind of discourse since the political power, or in this case the curricula, acts as a vanguard test of some authority even though the theoretic claims can be debated.

It could be argued, as was the case with Adorno and his work on negative dialectics, that the reflexive-discursive circle of enlightenment carries with it a far greater potency of persuasion and hence success amongst participants than the "diffuse dissemination of insights" associated with only the objectivating theories of scientific discourse. Another way of saying this is that because of how social change could be achieved, radical reformism is more fruitful than revolutionary or directly strategic action. Habermas puts it acutely in focus for curriculum planning:

... (such that) in advanced capitalism changing the structure of the general system of education might possibly be more important for the organization of enlightenment than the ineffectual training of cadres or the building of impotent parties.

(Habermas, 1971, p. 32)

the theory, is not of itself a full account of the theory's
utility, but as Willis and others have argued, it is
nating a space within socio-cultural practices, and
learners can with the vestiges of objectivity, but
different metaphors, symbols and theories, other
of pedagogy that cut deep to notionalized patterns. If
high school can de-skill and reinterpret students' work
under an insidious careerism, the possibilities of
factual interpretation should be greater.

(In this discussion it seems quite plausible to make
the following substitutions: objectivity theory for curri-
cular text; party or enlightened participants as curriculum
theorists; organization of enlightenment becomes curriculum
planning or curriculum development; correctness or truth of
theory as curricular evaluation; and participants or
to be enlightened as students, learners, citizens or other
interested parties; organization of enlightenment and
ive theorizing as pedagogical relations.)

I conceive three different levels at which Habermas con-
ducts his methodological project. Each corresponds to sub-
strates of intentioned activity at the level of the social,
psychological, at the sociological, and at the economic.
Each can represent areas of dynamic, personal, intent
personal or class/institutional activity in its own right,
but each is more properly expressed as a field of interaction
or interest-guided action. In my estimation, educational
practice and its subject, curriculum practice, are the
cultural codification, per excellence, of these relationships.

tion. Educational practice, then, connects an interest-laden way of life simultaneously as it represents the organization of species-warranted inquiry. In other contexts Habermas has termed this the social learning index of different societal forms.

1. I can identify a first methodological level as the elaboration and development of critical scientific theories (about science or society or literature or physiology, for example) that satisfy the rigours of scientific discourse or falsifiability in Popper's sense. The methodological aim here is the truth of propositional content; thus the correctness of the typical scientific community norms. Discursive examination, as I have referred to, does occur here as it ought in any conventional research deliberation. But the validity of such a theory for reflexive enlightenment can only be secured in a successful process of acceptance by those persons affected within an environment or social setting rid of domination. Each person directly affected by the theory's claims must, ultimately, have the opportunity of a reflexive validation of its emerging social interpretation. A way of characterizing this objective theory is by noting that the outcomes of self-reflection are changes in persons' attitudes due to therapeutic insight into past causative chains of self-formation which have impeded or obscured their ability to act. Objective theorising, if transformed to action, results in a technical praxis or strategic action declarative of the future. To some degree this would be close to the positions

curriculum theorists of development. In fact, it is at certain moments in the process of curricular development and organization.

2. I can identify as a second methodological level the arrangements and organization of enlightenment. These are careful (in the sense given it by Leontiev) pedagogical relations apply and test the critical scientific theories (as curriculum content, for example) by the mediation of self and collective reflection among the members of the group. The biographical import of these scientific theories is that of the world. The prevailing interest at this level is the precipitation of "authentic" insights. Such a curricular representation acts to portray for people their social location in a society ridden with contradictions. It informs them, if correct, of their real interests in this situation as an objective fulfillment of their potential (see Geuss, 1981). The organization of curricular selections and pedagogy surrounding them must be such (as it is with Freire) that the 'victims' or members recognize themselves as the subjects of the interpretation proposed through the group and through pedagogy. If recognition of self-interest occurs via the interpretations consciousness of the objective or true interest for each person, respectively. In larger numbers Marx termed this stage of consciousness "une classe pour soi".

An interrelated outcome of the process of enlightenment is the awareness among members, whether individuals or a group,

class or otherwise, of the career of their own self or characterological formation and the corollary awareness of why they have acted in particular habitual patterns. This returns us, as methodologists, to the psychoanalytic setting of distorted communication. Self-awareness at this stage re-aligns communicative action from its distorted, uneven relations of inequality to a plateau of practical discourse. From this point on participants have been restored to a level of, as Habermas terms it, discursive will-formation or constraint-free communication. Participants, as students, for example, are unable to act categorically through the media of, say, social action projects. Restoration to a level of practical discourse enables the development of authentic consensus or understanding of empirical events including actions of others, but cannot forecast or prescribe in what action members could or ought to be engaged.

3. I identify the choice and embodiment of political action as the third methodological level in this unity of interest-bearing practical method. Its structural equivalents in curriculum practice lie within curriculum evaluation - the type and scope of school appraisal and within the upshots of carefully, reflective pedagogy in the classroom. In other words, what kind of value-laden action do students engage in as a reciprocal dimension of their learning? Is social action, political confirmation or rejection or further critical analyses, the form of strategic or tactical solution to

be adopted? The theory-guided outcome is not the same as that of "prudent decisions".

What is the context of the organization of action by students or other citizens? Habermas indicates that it is only through the achievement of true consciousness in the reflective phase, that the justification of any course of action is recommended. By knowing their real interests, awareness of structural and political intrusions (e.g., the vulnerability of the classroom teacher) and possible political side effects (e.g., career discredit or violence to themselves) the connections of the theory with the practical redress of reality can be more strategically faced by participants. Only through having amassed this calculus of possibilities through practical discourse (the lesson text) can the affected participants undertake to act politically in enlightened action. Participants can be in the position of acting in their best interests when they have achieved structural consciousness of their historical and social niche as an ensemble of persons or as a social class. Critical theories of an empirical nature, in themselves, do not vouchsafe correct political action. This is particularly important as an issue for students enrolled in public issues or community school social studies programs as well as what constitutes a project that redeems its/her teacher.

This level of the organization of political action is a propos for the kinds of questions (traditionally) confronting reformers face. Let us consider, for one moment, that a group such as the reconceptualists could identify themselves as the enlightened vanguard of a particular social movement.

work. Given their hermeneutics, phenomenological or structuralist insights, these members have a set of opposed responsibilities to other curriculum workers and teachers and to the citizenry at large. Such a group can isolate itself in self-sufficiency and act unilaterally with radical change efforts in schools, for instance, or even elevate itself to a position of privileged holders of meta-theoretical exotica. Equally, this same group can exercise the choice of not breaking off contact with less enlightened, teenage positivists but sustain and remedy conversation with members who have not achieved their insights in the interest of building larger, global constituencies. (This certainly would be in the interests of alliance or front building.) Despite the fact that, say, empiricist researchers or analytic philosophers of curriculum are ideologically frozen and bound by interests difficult to uncover is no justification for their dismissal as professional colleagues. Clearly, such groups may show an incapacity for communication, certainly not communicative action, with others. It is likely that this underdeveloped compulsion could be remedied by a deepening application and explication of reflexive processes. This issue, however, is speculative and cannot be pursued further without some context of action. As members' practising enlightenment we must pre-suppose the same capacities for truth, authenticity and consensus-seeking in others, even as ideological foes. For the structural success of enlightenment, as an educational practice, depends upon the re-integration of all others' interests in a generalizable community.

I am reminded of Habermas's insistence on the need for conditions of work for critical theory. He indicates that theoretical work can only fruitfully generate under freedom of expression and the protection against victimization and the interests of interested members doing research in any discipline. There is a considerable risk that a organization in the public or international competition can manipulate the practical discourse of participants as a means of 'along the tasks' of intellectual reconstruction. If it will be justified to conduct research of a radical reformist nature over, let us say, the work of positivist colleagues. The short term research and reconceptualization seems to vindicate this strategy. In the longer term those committed, not, to the transformation of self and society must recognize that "in a process of enlightenment there can only be participants" (Habermas, 1971, p. 205).

The four fronts of inquiry, as a result of being tempered by my considerations, have now been given particular implications for the analysis of social studies are treated as a 'power structure' research question as a consequence of the nature of the inquiry which by applying itself to the uncover the conceptual and political...

research. The exact methodological configurations of this study into 'utopian social education prospects' are not fully specified but are rather in emergence for there is no unbroken causality of method or canon in praxiological inquiry. The more discrete parameters of who, what, why and when are answerable at this time. I close with a succinct expression of the kinds of practical and normative concerns I feel ought to beset a researcher starting this kind of inquiry:

Attempts at emancipation, which at the same time are attempts to realize the utopian contents of the cultural tradition, can, under certain circumstances be rendered plausible as practical necessities, taking into consideration the conflicts generated by the system and the avoidable repressions and suffering. But such attempts are also tests; they test the limits within which human nature can be changed and above all, the limits of the historically variable structure of motivation, limits about which we possess no theoretical knowledge, and in my view, cannot in principle possess any.

If in testing "practical hypotheses" of this kind, we, the subjects involved, are ourselves included in the design of the experiment, then no barrier between experimenter and subjects can be erected. Instead, all the participants must have the opportunity to know what they are doing - thus, they must form a common will discursively.

(Habermas, Theory and Practice,
(1974, p. 37)

FOOTNOTES

1. By reconstructionist social studies I refer to the epistemological, instructional and political assumptions of progressive era educators such as John Dewey, George Counts, Theodore Brameld, Harold Rugg and others of the period 1920-1935 who held that the primary task of the school through its curricula was one of political education and social-structural change. Contemporary exponents of reconstructionist thinking in social education are James Shaver, Fred Newmann, Donald Oliver of 'Public Issues' fame, Lawrence Metcalf, David Hunt, Harold Berlak to name but a few. The case can be made as I do later that current work in reconstructionist social studies is in distinct historical and philosophical lineage with earlier progressive era thinking.
2. Rachel Sharp in the monograph, 'Knowledge, Ideology and the Politics of Schooling' (1980) argues that a renewed protocol of inquiry for a Marxist sociology of education must incorporate analyses of commodity fetishism, current state theories, the logic of capital accumulation, and the organization of the labour process. I see strategic homologies within the mandate of this study of educational reform with curriculum reification, state legitimation functions, the epistemic organization of curriculum design, and modes of instruction or pedagogy respectively.
3. Three primary traits of pragmatism run counter to classical bourgeois philosophy.
 - A. A denial of cause and effect laws in the physical social universe. The experimental method tries to break down apparent fixities and induce changes.
 - B. A denial of the logic of theory and its replacement by an empiricist philosophy of direct experience. As experience becomes the final arbiter of knowledge that which cannot be experienced does not exist. One can merely count on the present for future projections.
 - C. The active, constitutive subject shapes the social world through ideas. These are based on structures of instinct, patterns of perception and a posited consciousness. Within this cluster of traits is the species desire for a normative community. Mead, Pierce, James and Dewey contributed to method designed to develop and fix intrinsically individual thoughts into a community of beliefs. (Parallels with the fear of accelerated social dissent and the interventionist state can be seen here.) Hence sound habits based on philosophical

axioms were to be the transmission work of the school.

4. I want to disclose more completely here the roots of the kind of critical benchmarks that this tradition of political philosophy uses in the criticism of social, political and intellectual regimes. I am also able to allude to the one basis of the practical method elaborated in this study.

The model of the suppression of generalizable interests is logically and historically gratuitous to the idea of undistorted communication. The first model is historically mediated by particular social conditions and participants needs. These interests are, in principle, publically knowable and shareable. Yet the idea of distortion free communication resides in the very structures of rational speech. It presupposes a truth-seeking, validity conforming individual who as a member of a group seeks to redeem political and moral claims about the world in an authentic consensus. Ideal speech situations or acts are what Habermas would term anthropologically deep-seated interests, virtually trans-historical in scope. They are also the bedrock that praxiological criticism in this instance, falls back upon, if pushed far enough. Both models, clearly, are critical of the normative power institutionalized in power relations of late industrial society. Both, too, function as forms of ideology critique complementarily.

How would the members of a social system, at a given stage in the development of productive forces, have collectively and bindingly interpreted their needs (and which norms would they have accepted as justified) if they could and would have decided on an organization of social intercourse through discursive will-formation and with adequate knowledge of the limiting conditions and functional imperatives of their society?
(Habermas, 1975, p. 113)

In the introduction to Theory and Practice (1974) Habermas, in somewhat Hegelian fashion, promises that this kind of critique enables participants to become conscious of the intrinsic injustice of normative structures and their derived interpretations. The key intent, in the organization of enlightenment, is to have self-willed participants substitute interest-guided action for value-oriented action on strategic personal, professional and civic fronts.

5. A condensed but essential account of the historical, political and theoretical career of curriculum studies, from 1920 to the present, in North America is sketched in the essay by William Pinar and Madeleine Grumet,

"Theory and Practice and the Reconceptualism of Curriculum Studies" in Lawn and Barton (1981).

6. For an extended treatment of these seven pedagogical categories see M. Markovic, "Ethics of a Critical Social Science", International Social Science Journal 24:4, 1972. Contained within the same essay is an account of the possible universal, anthropological, ethical and characterological norms that could act to ground critical study from a universal-humanist perspective.

CHAPTER 2

PRELIMINARY METHODOLOGICAL CONSIDERATIONS ON PRACTICAL CURRICULUM INQUIRY

THE NATURE OF SIGNIFICANCE IN CURRICULUM INQUIRY

Many of the methodological requisites associated with any piece of systematic inquiry need to be settled or accounted for in the mind of the investigator and in terms of the norms of the research community that provides the auspices for receiving and celebrating a study. I am concerned in this and ensuing sections to secure a number of procedural guarantees for this study. I address some conventional and some alternative questions that will, I hope, validate this kind of praxiological inquiry in the eyes and hearts of a particular but authentically, skeptical community in the area of the human sciences. I deal with some of these concerns impressionistically and with a sense of anticipation that by engaging in the study my procedures, constructs, theoretic assumptions and political perspectives may change in encountering the dialectic of this text, others texts, and theoretic and biographic consideration of the problematic so that I may grant the fullest interrogation to radical educational practice. In this sense, I strive through this inquiry of the dialectic of reform to make visible some of the contours of social and political emancipation.

This study attempts to stand in a tradition in educational

thought of radical social change. The history of reconstructionist philosophy in North America bears testimony to the possibility that educational practice and pedagogical visions can form one site with which to combat the reproduction of a repressive, exploitative society. In this inquiry I attempt to strike a line of commonality from the early period of progressive education to the contemporary expressions of this field in, for instance, critical social studies, public issues and jurisprudential-deliberative curricula. From the decade of 1925-35 theorists, philosophers, and curriculum developers imbued with the spirit of social reform, persons such as Theodore Brameld, George Counts, Harold Rugg, even the checkered work of John Dewey, apprehended a tradition, the legacy of liberal democracy, that legitimated the rights of citizens to call out against injustice, discrimination and gross discrepancies of economic condition. That the schools could be instrumental through curriculum planning and politically-conscious pedagogy in contributing to a restructuring of coercive political-economic arrangements or a re-adjustment of coercive institutional effects was an article of ideological faith held by liberal progressive reformers of that time. The same liberal democratic culture heritage is part of the received visions of school persons today. Despite the fact that we have been disappointed and hardened in cynicism by the rhetoric of reform and the structural inertia of the past fifteen years

(since the last wave of bourgeois cultural revolutions) the language of curriculum planning and theorising remains pre-occupied with understanding real social reform as only a logical-conceptual shift in its forms of discourse. I will argue in later sections that it is precisely the sense of hope and the fear of political engagement that render the husks of liberal democracy and of progressivism, in particular, a potent but mystifying force in contemporary social life. Since these traditions as cultural residues are reckoned with in our languages of reform and in our educational theory as operative forms, they must be understood, confronted and surpassed through the conduct of practical-radical inquiry.

In our own times it is to the credit of the "third force" that appeared during the 1970's that educational research is able to retain the social and political utopianism of the early progressive era. This group of educators of diverse interests mobilized new challenges and criticism of "the assumptions underlying existing modes of curriculum theorising." (Giroux, Penna, Pinar, 1981)

This study heeds the clarion call of this group of theorists such as MacDonald, Huebner, Greene, Apple and others for reconceptualizing the primary issues, procedures and research agenda of curriculum studies. I seek through the study a home in the community of efforts that re-focuses curriculum theory and practice.

Drawing selectively on such European intellectual traditions as existentialism, phenomenology, psychoanalysis, and neo-Marxism, these theorists (attempt) to offset the relatively apolitical, ahistorical, and technological orientation that has characterized the curriculum field for the last fifty years.

(Giroux, Penna, Pinar, 1981, p.7)

Within similar horizons this study implies, through the logic of its organization, a wide-scale re-arrangement of instructional settings, curriculum development and teacher-education. I attempt to call the bluff of the countless, vertiginous, energy-draining, horizontal models of curriculum development. Much effort and many resources have been funnelled into in-service-education and independent curriculum projects that call for horizontal participation in the development and implementation process. As a community we have lacked the means of understanding where and why our efforts and visions in these encounters have drained away. This study in part addresses the issue of how and why we can re-imagine possibilities for radical participation in curriculum development - living in this time and place. By instigating "internal dispute" as Giroux et al suggest, we can understand the historical evolution of the field in all its political, economic, and epistemological considerations.

This study is not anomalous in the contributions it makes to the reconceptualist movement. One of the methodological interests of the study lies in trying to tie the cultural practices and forms of our own biographies as persons working in curriculum to the societal structures that we inhabit and

sustain. I attempt to ground, as one of a number of conditions of doing practical inquiry, my curriculum thinking in dialogue with others in familiar, controlled historical space. In taking up the pleas of the curriculum reform movement over the last decade I see this work as firstly, involving the generation of a political and pedagogical stance through the utopian problematic. Secondly, I disclose the need for the embodiment, application, and renewal of the social relations uncovered by this research. If, as I have argued previously, the school and the curriculum community network become sites for political and cultural renewal, then radical-practical inquiry is an important activity. Experiencing the contradictions and structural gaps striating everyday life, in recognizing the role of the interventionist state in these contradictions and if the generation of lived-culture in schools, is not to reduce to a narcissism, but lead to the growth of antagonistic alternatives, then the possibilities for action through curriculum theory and development become key ones. The urgency of these sentiments is caught well by Apple:

By interrogating schools in a number of ways... focusing on class conflict, on cultural forms of resistance, on the workplace, on the school as a contradictory state apparatus, on the role of the formal educational system not only in reproduction and distribution but production as well - I am convinced even more strongly that such an analysis of education reveals how significant education is as both a process and a set of institutions. In a war of position, we ignore it at our own peril.
(Apple, 1983, p.167)

I pursue, too, through this study the development of a general, critical theory of education. In displaying the relations of domination and resistance that the forces of structure and human agency inscribe upon school life or curriculum communities, I contribute to a vital element to such critical theory.

The 'cultural capital' of participants in schools, in research communities, and on other fronts must be used in the reflexive and social analysis of persons by themselves and in their study of others. The cultural capital of affected participants as a dynamic of the classroom and the research pedagogy of our theorising of the state, of economic accumulation, and of comparative institutions must unite as an assembly of interests in a critical theory of education. This study speaks as a critical theory to the importance of democratic provision of decision-making in curriculum organization to the shifts of persons' consciousness that accompany such changes but also to the qualities of self-empowerment that can radically sponsor such alternative life forms. In some rewarding work on radical pedagogy, Henry Giroux warns of the dangers inherent in traditions of radical critique that conflate their methodological programs to either a romanticised subjectivity or to a grim depiction of external determinations as sole explanatory modes.

Such a view would take as its starting point an analysis of the interface between structure and agency, subjectivity and social practice. The critical moment of such an analysis would consist in developing a theory of pedagogy that embraced the conditions in which reproduction

and transformation interconnected within the lived experiences of those classes under study. The message here is that theoretical constructs that deal with reproduction and schooling must be returned to "their" living context.
 (Giroux, 1981, p.92)

Finally, I would like to make some comments on the use of historical writing, and the conceptions of historical method that incumbent upon this study to follow in large measure due to the problematic it embraces. The research question calls for a normative and practical appraisal of current and past reform initiatives in reconstructionist social education. By this token it must also respond to present calls for practical-accountable pedagogic practice in schools and pre-service programs. I find myself in the position of a fish 'rising to the bait' of such groups, for instance, who put such serious effort into competency-based and accountability instruction. As a result I am begged to provide a deeply radical response to such instrumentalist practices. In order to see the advocacy of control-centred orientations for what they are historically and politically, in order to give light to the eyes of those who would so self-seriously proclaim the importance of contractual objectives in the instructional and curricular performance, and then, in turn, to remedy profoundly the colonized directions administrators believe they want to take in curriculum planning and with schools, I suggest that as a research community, though riddled with internal neuroses and divisions, we take up the study and immanent possibilities associated with writing history. By writing and reading his-

tory we can begin to see that any talk of social change, and that means curriculum change cannot be done with any metaphor that excludes human attributes. In the long run understanding institutional life, and hence social process as we live and as others have lived it means rewriting history. In doing this kind of work, as in this study, we must necessarily take up questions of the nature of organized or advanced capitalist society. As Apple, and others, have so incessantly pointed out, it behooves us as theorists to recognize that capitalist society is by nature exploitative, and that the schools are not merely determined in their curricular forms and content by the dominant organization of economic production. Yet, there is more than that to it. Reading and writing history is one indispensable project for school persons, administrators and curriculum theorists interested beyond the mere legerdemain of opportunism or the character manipulation of others. To those who are humanly-interested, they will discover that in the late society they inhabit exploitation that is simultaneously economic, moral and cultural. For this reason no practical inquiry can afford to ignore the larger structures and the personal intentionalities that are the defining relations that entrap the problematic of reform. On the economic level, if we take up and examine the private ownership of the means of production and that for profit and turn it around, and it reveals itself now in one respect (wage labour or teaching), now in another (an acquisitive ethos or ideological curriculum content), and now in another (the alienation of such intellectual faculties

as are not required by the worker in his productive role, or pedagogical transmission as the separation of knower, from object, from the process of constitution we begin to appreciate (Thompson, 1978) how history reveals the inherent estrangement and powerlessness of much social and curriculum research on reform initiatives. In looking at the typical constituencies in the curriculum field, we find groups of particular people not amenable to social explanation neither through the use of a master concept, nor a refined or sensitive procedure nor through logical-empirical categories. Actually, if we look all we find are clusters of persons with different occupations, incomes, status concerns and so on. What we see of the curriculum practices of persons through historical understanding is

a friction of interests - the movement itself, the heat, the thundering noise...

(Thompson, 1978, p.85)

Nor, too, should any of us engaged in radical curriculum research excuse ourselves from inquiry on the other fronts of our problematic of utopian reform on the ground that the flux of history is all-answering. Edward Thompson writes in The Poverty of Theory that it is insufficient to conceive of historical method as some imperial telos of revelation because:

history cannot be compared to a tunnel through which an express races until it brings its freight of passengers out into sunlit plains. Or, if it can be, then generation upon generation of passengers are born, live in the dark, and die while the train is still within the tunnel. An

historian must surely be more interested than the teleologists allow him to be in the quality of life, the sufferings and satisfactions, of those who live and die in unredeemed time.

(Thompson, 1978, p.86)

Can we not see the irony of these comments for those more traditional curriculum theorists and educational administrators who insist on more 'precision' in experimental designs, for more 'fidelity' in curriculum implementation, for more 'accountability' in the teaching act, for more 'subjectivity' or 'understanding' in our phenomenological protocols? Let us work as inquirers with a sense of history on our backs when we relay the sufferings and satisfactions of our others in our schools. Too many curriculum development and evaluation projects have been convened, designed, and executed over the last fifteen years where those responsible for them as projects never saw Thompson's passengers, never spoke to them, never felt their sense of suppressed rage or humiliation of the way they were captured or dismissed as factors in subjective or mythological history - it really does not matter. This study creaks forward to answer all those years of immaculate results from furious educational research that came up with 'no significant difference.'

THE NORMATIVE WARRANT FOR PRACTICAL METHOD IN CURRICULUM INQUIRY

In the previous section I talked once again about the scope and importance of the precedence for inquiry I envisage as an upshot of my study. The prior sections in this research dialogue have been concerned with a discursive justi-

fication of method and of the urgency with which we must pursue the political and cultural questions behind curriculum reform. I would also like to address the more global justifications for engaging in this form of inquiry beyond the narrowed contours of curriculum studies - to display some of the appeals that other intellectual and technical workers stand for in terms of the reaching effects that studies of this nature done en masse could accomplish. A case was made earlier for the importance of reading and writing history in order that the flux of social relations that we partake in can be made sense of and acted on in strategic ways. To take this approach a little further I would like to extrapolate from several cultural traditions, movements, and theorists in Western science and use them in abstracted form as further warrants for my study.

I see myself investing energy in this study on a number of grounds; but, in one specific sense I am basing my commitment to inquiry on the legacy of a social democratic tradition found as pockets of political and intellectual circles in North America and Europe. In many of its manifestations, this tradition is in its finer expressions deeply conservative and deeply radical. As a form of cultural life each party, circle, organization or informal grouping shows the particularities of its members, their needs or interests and the regional biases and observations that have given rise to an historicised social democracy. As an agenda for political change and personal life trajectories, it anticipates the fu-

ture organization of social, cultural and economic life while allowing vital, critical elements of tradition to speak through as an ever present wisdom. The political culture of the movement is anticipatory, too, in the sense that social democratic forms can and ought to undergo change and dissolution once the possibilities of transcendence of social structures and consciousness contained within them, as communities of persons, are exhausted. What ought to be recovered for those dogmatic practising members is how a way of political life can and ought to change as self, structures and understanding themselves evolve. In this sense, the political legacy of this tradition should be seen as both deeply conservative and deeply radical efforts to convene communities of persons intent on remembering, determining, and practising a species-given quality of life. Pedagogically, I refer to a tradition that is concerned with cultivating help towards one's children and students. They become vital carriers of a social future and as persons who have a stake, if only they could see it, in re-achieving human dignity through their learning the public traditions and in their work with others. This study picks up on this suffused notion of education as help, (I am reminded of the work of Langvold in this regard), in wondering whether we remain capable as teachers, intellectual workers and theorists of resisting with every scrap of our energy dominant societal myths of progress, human intervention, leadership, dignity and tradition. What these hollowed-out myths can become if curriculum planning

couples public traditions with the organization of freely deliberating publics, in full recognition of the global texture of economic and political practices today, is an empirical question - of which the success or correctness of our intuitions will be confirmed in courageous intentionality with others. This study is one strategic move in fulfilling the responsibilities of this tradition. The organization of sets of educational initiatives is an obligation I hold.

The philosopher Richard Peters has worked extensively in the area of human conduct and the grounds of ethical responsibility and authority in education. In earlier work Peters (1964) has alluded to the importance for pedagogy of knowing and seeing the essential qualities of education as a concept and as a practice. He makes a number of conventional conceptual-practical contrasts for us between such notions as education and training, knowing that and knowing how, skilled instrumentalism and connective, imaginative mind, between thinking and doing, and between permissiveness or tyranny in pedagogy and initiation. All of these couplets are important orientating devices for curriculum organization in clearing up our historical and practical confusions on how to act pedagogically. Much of Peters' work acts for those of us in reconceptualism as a dialectical therapy or propaedeutic of discourse with others; that is, it helps us to get our concepts straight and a firmness of conviction in our reform work. More than that the pleas that such a philosophy of education contains act as warrants for this study.

Education, then, is a way of making explicit the criteria to which teaching and learning relations ought to conform. Education is to be seen as the commitment to worthwhile, freely do-able forms of the good life as it is empirically and counterfactually anticipated. This study and the cultural resonances that support and ground it are supportive of realizing those conditions. I must note how susceptible we become in designing and convening curriculum environments that mistake the polished performances of highly-skilled persons who inhabit academic disciplines for the critical educational practice this inquiry demands.

Peters warns us of the glib but highly-trained person, whether he works as the troubadour of philosophical idealism, or as the super-energized curriculum developer, or as the master philosopher well-versed in the magic of argumentative style who

...has a very limited conception of what he is doing. He does not see its connections with anything else, its place in a coherent pattern of life. It is, for him, an activity which is cognitively adrift.

(Peters, 1964, p. 27)

There is a warrant, too, at the level of teacher education for the kind of curriculum theorising and classroom pedagogy that I have been arguing for - one that initiates students into species-given worthwhile activities and modes of conduct. The University of Alberta, Faculty of Education, amongst some of its departments, consciously tries to reflect a philosophical and practical commitment, in its programs, to reflective action in as deeply a radical sense

as personal and political circumstances will permit. Over a period of the last five years social studies education has attempted to raise the horizons of its internal debates over the directions the field is taking politically, philosophically and pedagogically. Theorists and developers such as Mehlinger (1977), Shaver (1977), Newmann (1977), Berlak (1977), all in Shaver (1977) have struggled to reconstruct dominant discourse in social education so that it begins to question its organizing rationales and political orientations. Newmann argues that these choices are not merely voluntary volte-faces or linguistic turns of meaning in the field but are the conceptual and political restructuring necessary for the ethical and psychological survival of theorists, teachers, and learners living in late industrial culture. The social studies are by their own admission in a state of identity crisis and confusion. It is these very epistemic gaps that can become the intentional arcs of reflexive, radical reform for communities of theorists, developers and teachers in this field. I accent reflexive reform because of the legacy North American pragmatism has left with social studies program orientations. There has been a virtual oral attachment, during the years of optimism in the social studies, to the social inquiry model; ~~it~~ being understood as the singular source of a critical thinking which never really materializes. It is absurd to promote 'critical techniques' in the absence, in schools, of any tradition of problems with which to be critical about.

...the further point needs also to be made that

the critical procedures by means of which established content is assessed, revised, and adopted to new discoveries have public criteria written into them that stand as impersonal standards to which both teacher and learner must give their allegiance. The trouble with the models of education that I considered is that they fail to do justice to this essential inter-subjectivity of education which D.H. Lawrence referred to as 'the holy-ground' that stands between teacher and taught. (emphasis mine) (Peters, 1964, p. 52)

It is these species-given standards that evolve in historical time and space, under different productive modes that ought to incur our wrath when they are suppressed in theoretic debate or dismissed with the shrug of the teacher's shoulder. Critical historical work, self-scrutiny, theoretic understanding of institutional life and the unearthing of our shared normative possibilities that lie engaged in our public traditions are moments of the dialectical inquiry that continually circle in historical spiral through us and beyond us. As a parody on the efforts of good reform in social education since the mid 1960's, I may say traditional content without public tradition is an empty opportunism.

I find a warrant, too, for this study in the history of failure endemic in curriculum reform movements in Britain, United States and Canada from the mid-1960's. Walker and Reid (1975), Schubert (1980) and Shipman (1974) document the commitment among curriculum entrepreneurs across three continents for substantive change. Through analysis and action they have recovered lost dimensions of the human sciences in order to determine the conditions for using schools as sites of social resistance. The need for a comprehensive, mediated approach to

the research of reform and the reform of research is amplified on each occasion that we slip into a deeper estrangement from our colleagues and our own real interests. A problem each of us experiences, insinuated as we are in the routines of a calcified everyday existence, is, as Habermas has noted, the recovery and development of motivational and characterological structures that will act as substrates for more extensive cognitive capacities, comportment, and relational possibilities with others in living through traditions. To ask what the point of the practical organization of persons in this manner is or what the aim of this study is, as I spoke to in an earlier section, is senseless, for, in order to truly understand what the good life is, is to be committed to living it. With tradition sedimenting behind our backs, we always reach towards the possibilities that the question provides.

The Italian Marxist theoretician, Antonio Gramsci, in his search for eternal educational principles to guide revolutionary action, speaks to the importance of a formative or classical education as a preparation for the organic intellectual members of the underclass who help mediate and codify the world of dominant and external constraints with that of the spontaneity of revolutionary thrusts. In order to understand the dialectic of reform, criticism must bite the dust of tradition and labour that history throws up. To know about problems rather than to know of them requires for all of us a deeper symbolic and manipulative fluency. Within the intrinsic sediments of a full public history lies an important source of

educational practice. For pedagogy and for inquiry, then, I suggest

'There is a quality of life which lies always beyond the mere fact of life.' The great teacher is he who can convey this sense of quality to another, so that it haunts his every endeavor and makes him sweat and yearn to fix what he thinks and feels in a fitting form. For life has no one purpose, man imprints his purposes upon it. It presents few tidy problems; mainly predicaments that have to be endured or enjoyed. It is education that provides that touch of eternity under the aspect of which endurance can pass into dignified, wry acceptance, and animal enjoyment into a quality of living.
(Peters, 1964, p. 48)

THE LIMITS OF PRACTICAL METHOD IN CURRICULUM INQUIRY

In preceding sections of this chapter I have established the importance of the problem and the reasons for its importance that this study is concerned with; namely, the dialectic of reform in educational provision expressed in terms of the history of progressive school and curriculum reform during the last sixty years. It is also necessary, in anticipating future objections to the proper scope of this study, to say what it will not encompass in the way of inquiry. I make brief but germane comments on a number of issues that are currently fashionable to mention in the logic of educational research. By fastening my methodological position around what I intend to do, I hope to defray any licentious and specious objections to what my study has failed to do, for instance, in the way of dereliction in listening to the subtleties of human relations or the inexorable logic of historical patterns. I am open, as ever, as this study demands to debate on its inner

validity, arguments, findings, and practices.

I have made the case extensively in the introduction that to understand the dialectic of reform in organized education, in the way of restraint or change, that investigators must begin to display the complex interplay of cultural practices, ideological forms, and structural relations; that is, the determinants and influences upon school life and curriculum decisions in the professional, popular, and family subcultures of different eras of socio-economic life in North American society. However, after having revealed the density and complexity of the contending faces, relations and interpretations that mediate the outcomes of curriculum projects, I will not have revealed or accounted for why teachers, developers, and students resist or sponsor intentionally processes of change in social studies projects - or for that matter any curriculum innovation. The only practical possibility I can point to for my community of readers is to declare and show the dense networks in which groups of teachers and developers work with the hope that others will see themselves mirrored in these relations or can re-imagine what for their own projects they can accomplish in the way of radical movement. This study does attempt to give descriptive sequences of students and teachers struggling with innovations, accompanying feelings of strangeness and their oral reports of these experiences. It is naive and reminiscent of positivistic dreams to hope to account for all typical contingencies in explaining social action and thence to go about rating the reasons for success

and failure in particular curriculum projects. What I consider, however, as a second possibility within the limits of study is the discernment of generic attributes of pedagogy, possibly transcultural, but also the social and the epistemic auspices of curriculum theory that can convene radical dissent and practical action.

What is not particularly thematic in this study are the lived world of meanings, intentions, and subjective formations of persons involved with curriculum reform and innovations. As a research program of sorts this study sees life-world description and interpretation as significant but not sufficient in accounting for restraint and mobilization in curriculum reform. It is necessary to allude to life-world descriptions as one front of a broad inquiry committed to critical human practice. But to deny the sediments of tradition and structure a role in this inquiry is to stagger blindly in a vortex of the exotic present.

Allowing children to 'become' does not alter the conditions under which they must toil. When self-consciousness dwarfs social consciousness, when self-understanding for a few takes precedence over improving the standard of living for the many, then, we have lost the essence of humanism. Over emphasizing the power of the individual, people are abandoned to lonely struggles with the forces of privilege, wealth, and power. Humanism may sensitize us to the symptoms of our age, and thus must be continued...it does not enable us to go the next step and commit ourselves to effective action to change them.

(Sears, 1982, p.35)

The prior two issues connect methodically with the significance I attach to the signs, actions, speech and language of persons acting with academic and professional curriculum communities. A convincing position can be made for why conversational analysis or a structural phenomenology of language ought to accompany praxiological inquiry in the area of educational reform. After restraint, fear and revulsion of persons are experienced intimately and organized linguistically. Our norms of speech, gesture and hesitation are co-sponsored by the dominant socio-political relations of the world of form and reproduction. Why should conversational analysis not be included in this study? I argue that in many ways I can justify its inclusion in my research protocol but that I will give it a supplementary position in this present study because we can learn something, as curriculum theorists, from noticing the signs and patterns of language usage, and professional vocabularies in schools and with projects. I seek no systematic theory or explanation for the reproductive role of speech in the dialectical career of reform nor for the active, constructive interconnection of linguistic forms with resources and social relations. I do suggest that the nodes of speech, the linguistic practices that we can more easily assemble in this study are nodes worth tracing further in research applied to specific problems in curriculum development and evaluation. The directions these research projects could take as conceptualizations have been treated in short form in the appendix.

The concern, which is also a methodological limit, that

silently fuels this study is how can research into critical social education as a radical possibility also illuminate the darkness of understanding educational reform; that is, how can praxical research consider practical resolution of critical social education curricula as an intrinsic part of its agenda so that collectively and individually convened projects realize possibilities of change, now. To be able to pose this question successfully so it is understood, taken-up, debated and whether ongoing curriculum work is re-imagined with these practical-normative interests in mind determines the effectiveness of praxiological inquiry and studies of this nature. Any attempt to offer definitive explanations, interpretations or exhaustive caricatures of traditional research styles, within any of the four inquiry fronts is bound-less as it means begging the practitioners of different research interests to say to you that you've done enough. The final validation of this composite theory and analysis rests with the accord given them by those students and practitioners who share the assumptions, insights, actions and work convened by these perspectives.

Each collective project in critical-practical inquiry must, labouriously, begin anew as the particular moments and interests, and their remembrances of the world they have lived through have to be re-convened and re-achieved as a consensus of participants. I speak loudly about the fallacies and the hopes that travel with the renewal of curriculum reform but I speak particularly to the institutionalization of a critical social studies and the pedagogical parameters securing that

teaching field alone. This study has four fronts that accent and illuminate the different relations and levels of relations impinging on curriculum reform. For the study, broadly conceived, is but one small project in an array of current and future inquiries into the conditions of our national self-determination in a historical world devoid of a sense of human values or measure of worthwhileness that can sustain political, curricular, or economic projects of renewal. As I argue in the final chapters praxiological inquiry means a commitment and courage to recognize virtual moments in singular inquiry, in communities of complementary studies, and in alliances with teachers, and other citizens in community world-making. This study contributes directly in these tasks by identifying moments on fronts of inquiry and strategic action that can be virtualized in everyday struggles with one-self, with others at home, and in different communities. Conventional methodological consideration over the role of the study in theory building and generalization is premature methodically, politically, and historically since this kind of excursus intends to convene a practical method of participants. It is within that kind of community, those relations of desire and theorizing that generalization becomes a radical possibility.

I ask the standard bearers of methodological respectability to consider that this study seeks to realize reflexively in its pages-curriculum-as-informed, practically reflective action as it does the making of a pre-

cedent for theoretical objects in curriculum research communities. The grounds and limits of this study take their philosophical sanctity from these objectives. It is within the history of progressive social studies that I turn to answer my particular question about radical curriculum theory.

REFLEXIVE THEORY AS A DIMENSION OF THE PRACTICAL METHOD

I would like at this juncture in my preliminary discussion of method to become more explicit about myself, as the principal investigator in this study and to provide some comments that other social theorists and methodologists make on doing the enterprise of reflexive sociology. Accordingly, I make brief points that highlight the particular features of method with which I will be concerned.

As a principal investigator involved in an analysis of the possibilities and constraints of curriculum reform, I am necessarily using a particular subject field to "carry" my investigation. Given my knowledge of the social studies field, my teaching experience within it, and the historical organization of its content as a school subject concerned with the world around us, the method of this study necessarily involves using my self-experiences as a teacher, the historical and public traditions surrounding social study, and the normative or political impact this kind of teaching and learning has on the everyday world of students and others affected by the promises of social study. In short, inscribed within this

inquiry, and my role within it, are a normative interest and a pragmatic interest in strategies of curriculum development and implementation. In order, I feel, to address the question of real curriculum development and implementation means to ask what the conditions of curriculum change are that promote the common interests of all affected participants. To ground our inquiry of curriculum reform or change successfully in self-interest and in collective interest means to determine the questions and knowledge that will reveal transcendent human values and the forms of organization and deliberation required for educational projects of self-determination. I attempt to work through explicit normative and pragmatic interests since the dominant texture of curriculum work, today, is derived from its reception and production in schools, in ministries of education, with client-based groups and less so within alternative community projects marginal to the dominant political-economic institutions. Hence, I, and others must be intellectually and culturally sensitive to the institutional realities of participants in curriculum projects yet at the same time not lose sight of the utopian and normative premises upon which we base our renewal of curriculum theory.

This means that the theory and method of curriculum confronts the structures of 'forgetfulness' and denial that are such encrusted features of everyday personal and professional determinations that occur in formal collectivities. It means repositing the lost themes of possibility and association we hold only traces of, and of deeply understanding the mechan-

isms of institutional suppression whereby gifted, committed persons are factors in their own disenfranchisement.

Conventional social or educational inquiry cannot easily decode the patterns of mystification that obscure our ideas and orientations towards reform and development in curriculum or cultural practice. To take the idea of progressive or its related historical term, progressivism, connotes so much in the hearts and minds of persons but is understood so little. It suggests a watery, emotionally-thin sense of continuity in the future with little specification of concrete end-states or outcomes whether in nation-building or program development. For the cynical amongst us it could refer to the continuance of estrangement or immiseration. The political culture of which progressivism speaks is one of liberal democracy which assigns morality and failure to individual shoulders in a social order of competition and acquisition. The loss of community, within the liberal vision, wherein individual interests are celebrated in a commonwealth of order is a significant feature of late capitalist society. As such we lack a social history of ideological expressions or symbolizations that can account in part for our forgetfulness in working with others and to what and where we can find our common interests with each other. To take the term progress and submit its everyday and formal usage to ideological analysis, alone, is one necessary front in inquiry not yet accomplished in an ongoing project of curriculum theory. It is only one sub-project that will partly reveal our unwitting complicity as professionals and citizens in our 'disempowerment' that is

reproduced and resonates within our family life, our leisure pursuits, in the relations of our work space, and in our internal organization of time. O'Neill provides a precedent for the kind of work that I envision must be the work of all educational inquiry. In borrowing the sentiments of C. Wright Mills he writes:

It is the task of (human and educational inquiry) to conceive of men's private troubles in the contexts of public concern and to furnish bridging concepts which will enable individuals to translate their private uneasiness into public speech and political action. It must undertake to shift the contexts of freedom, equality, and reason away from the private sector and out of the household into a public domain which will constitute a genuine common world....

Curriculum practice as a normative and practical ideal must become to develop these practical bridging concepts that will galvanize

...understanding and responsible control over the human and social values generated but largely dissipated in the corporate economy which enforces the privatization of men's lives.

(O'Neill, 1972, p.37)

I am suggesting that these kinds of tasks fall, in part, to the self-reflexive inquirer and to the kind of study he convenes. This study, then, and my sentiments are distinctly romantic at times, encouraging all of us to leap over conventions to embrace responsibility and action. This study is determined to understand itself as it does students, teachers, developers, other theorists in the attempt to break with pro-

fessional narcissism and opportunism. I argue and do analysis in the larger effort to renew the historical thread between self-consciousness and consciousness of the social world. It has been all too easy for school persons to adopt the 'un-situated rationality' of instrumental procedures whose spurious success in schools and curricula has obscured those subjective bonds of practice and responsibility. The recognition that my knowledge, and our knowledge through this inquiry as educational perspectives, is social knowledge, self-situated and mediated within my own/our own experiences is a moment in this method as it assumes public or pedagogical responsibility as a subject community necessarily informed with moral vision. This is another way of saying, as does O'Neill (1972), that 'we can be aware of the reflexive limits of the body of human science knowledge tied as it is to the conditions of a social and political order.' So much of the substance of this inquiry resides in the asking of questions of this order: ones that pose the conditions of our knowledge of effective action and understanding in curricular or pedagogical projects. This implies that we continually seek to determine clearly as theorists and practitioners what the limits of our understanding and theorising are, against an entwined backdrop of self-consciousness, political and social structures.

For curriculum the 'institution of reflexivity' is particularly important as a method of inquiry and is a way of life for those who inquire. This is another way of saying that the conception of curriculum-as-informed practically-reflective

action is always a process of 'sedimentation and search'.
That is, this notion of curriculum practice I envisage and
which informs this inquiry, implicates me, in

series of exchanges between subjectivity and
situation in which the polarities of means
and ends or question and answer are con-
tinuously established and renewed, no less
than the institution of ideas, truth and
culture.

(O'Neill, 1972, p. 231)

Is this notion of reflexivity yet another methodological de-
vice that I ask all of us in curriculum theory to adopt? Not
really, since reflexivity encodes our efforts at self-creation
and determination, at the same time as we acquire competence
in public intellectual traditions that as Peters (1969) has
indicated are the gateway to a recovery of the auspices of an
original, species-given past. Our spontaneity, or accents of
the lifeworld, initiate time and again world-building initia-
tives and the utopian promise,

...which is nothing else than ourselves, borne
only by caryatid of our efforts, which con-
verge by the sole fact that they are efforts
to express

(Peters, 1964)

and utopian promises to redeem.

Within the alternative spaces, I, you, or we can carve
out theoretical communities that nourish and support rational dis-
course in social and curriculum theory. As Habermas indicates the
conditions of ambiance for rational discourse are ones rid of violence and
repression. It is likely that unless the deliberative groups that theorise,
develop and design utopian educational environments can work in

different conditions,

there will be an inescapable pressure that -
 openly and covertly, crudely and subtly -
 sets into motion a thousand inducements to
 false consciousness.

(Gouldner, 1973, p. 79)

1. The Investigator and Teacher-Developer as Data Sources

This study involves a number of dimensions of data and perspectives that I convene for the purposes of praxiological inquiry. One source in this multiple 'triangulation' of perspectives on the question of curriculum change has to do with my formal role as a teacher and developer of critical social studies courses and resources assembled for their pedagogy. In this study, and particularly, in later sections that attempt practical resolution of the bases of curriculum reform, I will recollect my formal work, experiences, and knowledge of approaches to the organization of social studies teaching, its content and evaluation sequences, and contingent world views that accompany efforts in identifiable critical-practical education--in other words my role, as an inquirer of this study at one moment in time, a theorist conversant with ways of organizing social studies teaching, curriculum development approaches often associated with this field and the discipline literature that acts to justify social education. My role as a naive theorist remains unreflexive in the sense that I do not at points in the resolution of the inquiry reflect upon the effect of my consciousness upon my formulation

of the social studies to students or practitioners nor do I at this moment of the inquiry consider the social and political contingencies of social studies teaching, development and evaluation. Assuming the role of a theorist in this sense serves a necessary function for the sake of analytic clarification in this study. Theorising, such as I point toward is a suspended practice that is denied an historical context only for the time being so that reader and theorist alike can identify the cognitive kernel in the social studies literature or reform problem. The task of reflexive theorising is one that restores or re-embeds the former cognitive kernel within a living context of self, situational and structural relations. But to identify and know in some austerity the intellectual elements of (empirical) social studies projects that express critical-practical, libertarian, or social reformist intents in the organization of their pedagogy is a necessary moment in understanding intellectual and cultural traditions. These are traditions that have been encrusted with the generational interpretations of different professional, and economic interest groups over the course of two different eras of capitalist culture - from liberal, monopoly forms in the period 1920-1950 (Weinstein, 1968) to the advanced, organized form in the period 1950-1980 (Habermas, 1975). To isolate the original intellectual currents through naive theorising is to see the active, transformative role of interpretations that ideologically diverse groups have applied to terms such as progressivism, critical thinking, group-based learning, individualization, interest,

and accountability. As a form of naive theorising undertaken in social analysis, Gouldner captures well one of the motivating interests of this study:

Theory-making is often an effort to cope with a threat to something in which the theorist is deeply and personally implicated. For a theorist (as for others) there are two kinds of social worlds: permitted (or 'normal') worlds and unpermitted (or 'abnormal') ones. The theorist is likely to start work when he sees or suspects the existence of an unpermitted world, or a threat to a permitted world. A considerable part of his work is an effort to transform an unpermitted world into a permitted one, thus normalizing his universe. Most particularly he is attempting symbolically to re-establish a threatened or impaired equilibrium between power and goodness.... (Gouldner, 1973, p.71)

2. Self Reflection and the Research Protocol as Data Sources

What place is there in this study for what Gouldner (1970, 1973) and O'Neill (1972) have termed reflexive theorising or social study? My task as an investigator or curriculum theorist in this study also obliges me to become sensitized to my own constituting powers of consciousness. That is, in the way my bias, preferences, experiential accents, preferred worlds, interpretive schemata and so on act as practical embodiments of more formal curriculum and research protocols. It involves making myself as an inquirer and my readers explicitly aware of how all cognitive and emotive structures have impinged upon my choice of research design, my range of questions for the objects under study, and the

130

kinds of implicit choices that I have made as a developer and teacher of a particular social studies course. To identify this kind of reflective theorising as a methodological responsibility that I bring to the presuppositions of my inquiry in the logic of curriculum reform means that the formal or naive theorising I alluded to earlier becomes entangled when self-consciously thematizing the biases I have worked through as my presentation in the lived world of pedagogy and curricular theorising. As a self-reflexive inquirer, then, the auspices of my investigation require that I am at the same time under my own investigation and part of my own inquiry. This is the same task that O'Neill (1972) poses for the logic of social theory as to whether we are as an intellectual-cultural community, 'authentically aware' of the limits of human science knowledge due to its links with social and political orders. I can rephrase the question by asking what limits do I impose upon the problematic of curriculum inquiry by my being tied as a consciousness to a politicized body in a world in which I with others reproduce ourselves?

I am involved, too, in reading my text of inquiry as I do the work of others in what has become public tradition. Reading text implies a knowledge of the traditions that a person works within and care for those who are recipients and participants in this work. Hence self-reflection of text and of inquiry means the arrangement of my speech or argument to the interests of others. It is addressed to readers as both criticism and persuasion through discussion of old traditions

in search of new possibilities in curriculum and social study. I elaborate persuasively in my arguments in order to demonstrate our essential connectedness and responsibility with the utopian moments of dignity, necessity and friendship. I can communicate the textures of alternate social orders by cultivating a style of thought, speech and gesture. (The style of question in any human inquiry is bestowed by the times.) The elaboration of human science research is determined by the logic and the limits of the questions posed - these are particular, as we have discovered in the history of curriculum practice, to a historical and political context. My inquiry recognizes that the logic of any methodological question into a study of formal human accomplishment (curriculum reform) is a biographical one or self-formative one at the same time as it is one that draws its warrant from our theoretic and public communities.

All forms of collective life (e.g. religion, law, morals, political institutions, customs, teaching practices), have their reality independent of the individual consciousness of the persons carrying out these precepts that the group prescribes and proscribes, and they can accordingly be studied independently. But, as Durkheim notes, not all social consciousness (as opposed to individual consciousness) achieves externalization and materialization. There is much - the greater part - which is diffused and "at liberty".

(Cicourel, 1964, p. 192)

The inquirer embarking on any analysis of cultural forms, the social relations that produce them, and how such cultural forms as practices act back upon persons requires an under-

standing of the language used by participants and of the codified language of the practices themselves. The formal or structural arrangements of curriculum is codified language that possesses a history and a power of constraint upon persons. Yet those cultural meanings are not sufficient for understanding the ongoing accomplishment of outcomes in way, curriculum projects in critical social studies. Until the inquirer not only theorizes about the general conditions for curriculum reform but also treats, in some way, his own and participants' common sense categories of experience as theoretical data he forgoes using inquiry as a communicative organization of practical activity. In not making thematic the inquirer's constructs as he does other participants typified notions of innovation, development, or pedagogy, or evaluation, say, he risks a biographical confounding of both his study and of the practical curriculum projects he seeks to reconstruct. I refer to what Cicourel might call the 'outer and inner horizons' of objects of sociological inquiry. To be cognizant of the history of curriculum reform, its dominant approaches, and its political context only yields typical distributions of types of curriculum innovations and kinds of strategies that have been used for organizing persons. Equally, to dwell upon protocols and typifications of participants of temporal descriptions of their life inside and out of curriculum projects in short, their inner horizons, yields structures of personal knowledge and coping strategies persons generate in the order of group life. This inquiry, as

curriculum inquiry to be practically responsible, must incorporate 'both sets of typification as objects of sociological inquiry'. (Cicourel 1964). The grounds of our theorising about our practices and about curriculum reform are embedded in each other's biographical situation. The level of cultural or ideological practice, although an object of independent theoretic interest does not dissolve in the energies of the self-situation but remains tensionally tied to it.

3. The Public Self, Students, and Curriculum Knowledge as Data Sources

Another way of seeing my role as self-reflexive inquirer is to view this study as beginning with me and ending with me in some shift of resolution. The study starts by my posing in the introduction the nature of the practical, political problem of curriculum reform as I have encountered it. I make available theoretic insights and historical evidence to help illuminate for the reader my sense of the problem. The logic of this kind of theorising has its own career throughout the study. I also start another strand in this study doing as I have been doing now, writing about method and about my own involvement in the constitution of method. I feel it is important to declare directly, but not simplistically, the kinds of personal and structural contingencies that occur for me in formulating method—particularly deeply practical method. The neutral observer model of theory construction and verification will not permit me to display how

my self figures in this study as a systematic object of inquiry. The false consciousness and hidden partisanship that accompanies these methodical approaches severs the very social relations between myself, my text or study, the world of social objects, and the resolution of the questions posed by the inquiry in a large professional or intellectual community. At any of these moments of deliberation whether as self-reflection, dialogue or consensus I am implicated as an author in original speech as I am caught in the tentative outcomes of this inquiry. These outcomes can be further questions or questions, the 'search and sedimentation' of intellectual gatherings, of the hard-nosed scuffle of curriculum development and implementation projects.

The other broad fabric of relations that co-mingles with myself-in-text-with others is the interconnectedness of myself in the world with students. Typically, relations with students that are directly related to this study have been with those students in courses dealing with critical pedagogy, with critical social studies, and in seminars concerned with alternative educational research traditions. I have used depictions of these students, our courses together, and the structures of our teaching and learning as paradigm cases for the recurring constellations of doubt, anxiety, and celebration each of these pedagogical encounters has meant for myself and for my students. As these cases appear in later sections of the study they are intended neither as positive proof statements or as evidence of the way critical social studies and

hence radical curriculum reform can be. As descriptions codified within them are hope and desire for new possibilities for all of us in teaching and learning arrangements - indeed in the selection of courses and students I draw from over a three-year period the kinds of responsibilities, encounters, and inquiry they did as students and teachers had shifted radically from what was conventional in their experience of teacher education to that time. It is important rather in these methodological considerations to consider those lifeworld portrayals as emblematic of what this study seeks to answer: how is radical curriculum reform possible and what do we need to know and to practice curriculum in that manner? The cases and descriptions which emerge in a later section serve as students speaking for themselves about their wonderings throughout such pedagogy and as a reminder that the methodical threads of this inquiry, as must critical, historical curriculum research, display an interweaving of perspectives of self-in the world-with students-in science-in the world. The understanding and personal energies that accrue from allowing the relations to re-surface within a practical gestalt amongst each other are professional tools curriculum workers at all levels require.

One resistance from students that I have encountered during the course of critical social studies sessions is a difficulty in accepting the presuppositions of a pedagogy that recognizes not only the awareness of evil or injustice in the world but the commitment to remedy them. It has

seemed 'extremely painful and threatening' for most teachers in training to believe that what is powerful in society is not good or that 'things of moral value lack power'. Even when this occurs, students in a world they live in and see, which is unpermitted, remedy these contradictions internally. Students "depose the unpermitted world and readjust the flawed relationship between good and power in various ways." Students while formally agreeing to the tenets of the course often "find ways to affirm and accentuate the goodness of the powerful". (Gouldner, 1973) This kind of occurrence through pedagogy indicates one instance of the depth of contradictions facing radical curriculum reform. It also indicates why we must cultivate the kind of careful, caring inquiry in methods courses that can as a language of invitation be present with students when they encounter the shock of discovery, about political relations, opportunity, and personal choice. To discover that even in despair one can collect others around him is one mark of this study.

For my part, there can never be any question of the transcendence of (social theory); it is given with my relation to the world and others around me without flight beyond this touch or talk. Socially, our universals lie between heaven and earth, in the toss of the crown, not on the tightrope of pompous metaphysical generalities but in the face-evident relations between myself, others, and the world around me.

(O'Neill, 1972, p. 219)

4. Mediating the Primary Sources of Students and Pedagogy

It is important in a study of this nature to clarify

what I will not attempt to do with the historical, conceptual and phenomenological evidence available to me. I have argued about the importance of including the political and normative concerns that ground the study. I have indicated the importance of including the perspectives of the investigator as a teacher of social studies. I have stressed the importance of becoming self-reflexive so that I, as the investigator, become an object of my own scrutiny as do my pedagogical relations with my students in the course of our classroom encounters. All of these dimensions I suggest are invitations to consider how to be deeply practical in our efforts in curriculum reform. This study, it is important to note, has no pretensions as a piece of phenomenological writing. I make use of classroom descriptions, student responses, and lifeworld fragments in the tradition of a reflexive sociology. To the degree that my transcripts suggest something of what critical teaching in a classroom is like in relation to more elemental structures of human experiences then it may well be episodically phenomenological.

Let me characterize how I intend to use student descriptions, fragments of historical evidence, and ongoing projects that characterize critical pedagogy. In understanding social action, I rely, in part, upon portraying the cultural meanings that can be collected from personal expression, from group encounters, from the sediments and traditions of second hand knowledge I have of curriculum and social education practice, and from the theo-

retic perspectives I use to sort, generalize and evaluate the political and cultural phenomena of my study horizons. The reach or visions of social action, in large measure, hinge on the possibilities and limits cultural meanings have for persons' movements or commitments in the social world. These meanings act to orient, guide, and shape social relations in person-to-person exchanges as they do with secondary relations and interpretations. Ideas such as curriculum, development, evaluation, and reform, as social action can be explained as practices without reducing our inquiry to the psychological, substrates of motivation and perception. Or, equally I am not bound methodologically to go to the phenomenal lifeworld solely or entirely in order to understand the embodied resistance or mobilization for change characteristic of the history of curriculum innovation. What I do attempt to portray and use as evidence for explanation are the norms, interests, and ideologies binding on persons, on groups, on social classes and "that transcend any particular action taken as a psychological entity" (Cicourel, 1964, p.196). In order to study curriculum reform in a deeply practical way, so that what is uncovered for a community of readers leads them in dialogue beyond the private spaces of heads nodding in assent, to set precedents for themselves, means to lay bare the power of normative and biographic unconcealment.

Despite our intellectual sensitivity to reading the minds and stepping into the trousers of the 'salt of the earth', it is important to do our intellectual history. The

power of what is great in humanist social theory lies precisely in its abilities to understand social structure and social action concurrently. To understand refers to this seeking and sedimenting of essential properties of human practice. Hence the methods appropriate to curriculum inquiry must incorporate both in the life and times of the theorist. My study is concerned with making sense of the nuances, the questions, those first words of all of us in pedagogic situations and the commitment to renewal that each makes in true words and deeds towards others. I view that kind of interest as a critical moment in recovering the history of practices in any study of curriculum reform. It is a moment in method, however, and we are behooved to see more than actors in the horizon of our work. The importance of the sense-making affairs and cultural meanings of persons is transformed when we consider such persons' energies collectively and historically. This study dwells not as such on the relations of meanings to particular events but on the invariant properties of meanings that act as constitutive boundaries or rules over space and time. Hence, I am concerned with an analysis of particular persons' responses to critical social studies teaching under set conditions. But I am more fully concerned with how these cultural meanings, say in the educational practice of progressive reform in North America 1920-1980, have become the dominant ideologies and values that make up the professional vocabulary and motives of action of teachers in classrooms

across the continent. I am more concerned with the expec-
tions and effects of these ideological orientations upon
teacher pedagogy, teacher and student relationships, and the
implications this cultural and political legacy has for the
form and innovation in curriculum. I have not found it
that my students have used in explaining their feelings about
doing social study qua speech that interests this inquiry
methodologically. It is the relations of use and resistance
as sustained forms of world-making and resistance that is the
theoretic object. It is the recurrent styles and forms of
argumentation that liberal and radical progressive reformers
alike have used as ideological discourse and as typified
cultural practices in texts, programs, and philosophical
relations, in a late industrial state that is the methodo-
logical and conceptual focus of this study. Understanding
existential domains as expressions of historical and struc-
tural relations is of strategic importance for praxeological
research but equally as a practical gestalt for curriculum
field operations such as development and evaluation.

Cultural forms, as Willis (1977) and Williams (1977) con-
ceive them, are practices internalized and socialized that
can constrain and deny reconsideration of social and poli-
tical relations or can generate reflection and organization
of alternative practices. It is facile to beg the question
of radical dissent in politics and education. Too much hope
has already spilled from the bridges of organization con-
necting our ideals with our practices. Fifty years of re-

constructionist historiography has shown us where the radical tracks stop. Sociological inquiry fails if it does not communicate what is urgent about present political and academic contexts.

In mediating the contexts of relations that the cultural forms of curriculum history express, I weave an inquiry of speeches that implicate me as an historical-biographical person, as formal teacher-developer, my students, the intellectual traditions the problem-convenes, and the structures that are the sediments of generations of speech on these matters. This inquiry as a theoretic speech in recognizing those former constituents as the historical present is a method of utopian thinking. Its practice is that of a humane society. (O'Neill, 1972, p.225)

5. Naïve Theorising as an Aspect of Practical Method in Curriculum Inquiry

In what might be considered undialectical in some radical academic circles, this study also engages in what I have termed naïve theorising in contradistinction to reflexive or self-reflexive theory. Left on their own as self-evident perspectives my analyses of progressivist history, theory of the state, and re-conceptualization of reformist curriculum theory will wither with the remainder of the fallen literature in academic repositories. As O'Neill suggests the proper role of human social theory is to discern the limits of our social science knowledge and the roles ourselves play in constituting those through our

ties with social and political movements. It is necessary but not sufficient to know what we know about class, or racism, or repression, or curricular reform. It is vital, as well, to know why we know and why we ought to know about our structural and biographical worlds. That kind of questioning is the kernel of a praxiological method. That is, why and why ought we to know that we theorize in the social world? That we do critical theory, pedagogical theory, systems theory we have less difficulty, as a community, in comprehending. The question of what brings us to theorize and account for what are selected as problems are rarely seen themes in the corpus of social science research.

I am engaged, in this study, in a critical historical analysis of developments over a sixty-period in liberal and radical progressivism. I portray the variety of curricular, pedagogical, philosophical, ideological paradigms that have dominated discourse in progressivism. I examine two ideological strands in progressivism in order to give historical depth and texture to the origins of current struggles within educational reform. This also allows the current problem, achieving radical curriculum reform, to be seen as a historical outcome of contending interest groups holding degrees of state power.

I extend this historiography through an in-depth conceptual analysis of current practices in social education that clearly bear the stamp of both moderate and radical

progressivism. Although I look here at contemporary programs in North America, I am interested in what conceptual analysis can provide of the ideological and political character of those writings. How would such programs be taught and organized; what outcomes can I envisage in terms of student consciousness and community action? In the introduction I pose the problem while a critical history yields a sense of the generational struggles over educational definitions and social utopias. The conceptual analysis completes the relationship of particular-to-universal that can define the educational problem by posing the existential and political-pedagogical opportunities, the cultural resources, and requisite organizational forms available to us as curriculum workers living everyday life under organized capitalism. Further conceptual work occurs as I attempt to uncover the latent intellectual and political possibilities for reconstructing social education programs in the light of preceding analyses.

Various theories of the state in an intellectual line consistent with critical social theory will be examined and integrated within this study as a means of showing how economic and political power is distributed in organized capitalist states. I have placed particular emphasis on displaying the effect of the Canadian state, Canada's social structure, and the occurrence of economic crises upon the content and structure of educational provision. An important principle to demonstrate is how the changing nature of

economic and political crises in Canada has contradictory effects upon the role of schools as mechanisms of social control and estranged consciousness and as sites of radical curriculum planning and deliberation.

What I begin to confront in part II of this study and what achieves tentative resolution in part III is the question of political power and the role of human science knowledge in convening new definitions of knowledge and practice. Problem-posing, theory, and evidence constitute recurring phases of a dialectic in this study that set to question their respective historical, economic and curricular interests. At the same time these traditions under the auspices of this study set to question their first premises as a way of understanding of educational change. I have then a dialectical inquiry that examines what has been called the typified world of institutions, comparative social structures, and ideological histories that situate progressivism as a series of cultural practices in North American societies. In a memorable passage written over ten years ago the late Alvin Gouldner, upon whose shoulders this study finds precedent writes:

The vital thing is not the willful assertion of an alternative theoretical position. The decisive thing is to establish the human conditions that will nurture intellectual and theoretical alternatives, new technical paradigms, new middle-range theories, or even new epistemologies. 'Establish' here means that one wants a critically justified understanding of what kind of human conditions would be preferable and it also means putting this under-

standing into practice; it means an effort to enact these understandings in new communities and reconstructed institutions.
(Gouldner, 1971, p. 92)

6. On to the Practical Method

So far in this study I have taken that there are distinct parallels between the nature of curriculum theory and some varieties of social theory. As a youthful community of practitioners we are concerned with collective life and with often unstated informal struggles of persons or groups of persons in institutions such as schools, theory, development, and policy evaluation. We are concerned with the spatial arrangements of schools, of our research and of the historical distance between our practical projects. This distance, whether physical or of consciousness, clearly affects the nature of our primary and secondary relations with another as it does the norms, values and ideological dispositions with which we contend - and to which our actions are often limited. This could be considered a large part of the purview of curriculum theory.

At the same time we inhabit as practitioners and citizens a larger collective life that often materializes informally in sub-cultures, group life, orally, and in unstated understandings. What we know of our interests, our policies, our ideologies in a formal sense is often insufficient to account for what moves persons in social conduct. This is because much of the measure of collective life is

constituted by the rush of perceptions and impressions of participants acting in concert or individually. Our official sociological or economic accounts do not reconstruct how social life is endlessly accomplished. Our social science knowledge that is directed to communication or interaction often crystallizes the implicit ideological interests and conceptual schemata as the invariant properties of social action that it really has not uncovered. In a field of study such as curriculum theory and practice, since research to explain change, or for that matter failure, has depended upon hypostatized constructs or methods that assume narrow models of participants' rationality serious doubt has to be placed in the analysis and results of analysis in curriculum practice to this point. Since the 'inner horizons' for one, of a curriculum project, or the contingencies of radical curriculum innovation for two, are "sufficiently indeterminate" for inquirers who measure, theorise or practice in this field, methodology that is other than dialectical, historical, and interrogative will deny the very bases of human being. In the absence of a self and social reflexivity curriculum theory and research has no place to work as its auspices in membership and tradition have dissolved.

Reflexivity is essentially an act of criticism. Research or theory that is reflexive becomes a chain of acts which claim membership in a community of knowledge. For understanding curriculum this is truly an interdisciplinary practice. Theory as

criticism means acting within and for a community of men in solitude and in solidarity. As a rebellious act it requires that we recognize our common ground and possibility with one another - which is the measure of all relations of all critical projects taken on together. Since the grounds of our criticism as theory lay in our assembled communities, we are able to work through what Habermas has termed the species-given interests of labour, language, and struggle. In curriculum theory, as in the social world, pedagogy teaches us that attunement to the things of the world as well to the possibility of their coalescence in the ideal means care in human transcendence and in suffering. Clearly, to confront the possibilities of radical change we work with our hearts and our theory.

This study, and the coalescence of moments of inquiry as outlined, requires a deeply practical commitment from its readers to examine their work and their engagement with others since to understand curriculum reform means to understand how and why our work reproduces political practice. We must shed the insulation of our illusions to see practice as a direct materialization in society in the same way of economic practices. Curriculum theory, as this study becomes, is a theoretical labour that requires interrogation of its own grounds in the reproduction of social life. Hence curriculum theory can be investigated from many fronts including those that demand epistemological breaks from a prescientific, redundant past. Reading, writing, arguing as

structures of intellectual criticism, and the
the relations of authority in a utopian
finite language, labour and laws.

It is a shuddering experience at the
in our world-making enterprises of curriculum
the sheer power of the potential, and are
on their moral obligations that makes the
ate and imminent. Typical inequality of

utopian potential of the practical method I
wisdom of an aphorism or two on truth:

The jealous keys to Truth's eternal doors.

SHELLEY, Triumph of Life.

The locks of the Temple of Truth are neither
to be picked by cunning, nor forced by clam-
orous violence. The noise of furious
arguers is the noise of shutting rather
than opening the temple-doors. The loud
shouts with which some people appeal to
reason imply that reason lives a consid-
erable distance off. If their hearers feign

conviction, it's for the sake of peace rather than of truth. The very style in which the autocrats of opinion (brought up "in the school of one tyrannus") state their proposition is a warning that they do not mean to have it questioned; and their fate, as far as the chance of arriving at the truth is concerned, seems well described in the following words of Soulie: "Ils considèrent le silence comme une victoire, leur vanité s'en gonfle, et ils arrivent à un état de demidieux, où rien ne peut plus les atteindre."

(from J.F. Boyes, Lacon In Council, Undated, London)

CHAPTER 3

OUTLINE OF A METHOD

HISTORICAL TRACES OF THE IDEA OF PRAXIS IN CRITICAL HUMAN SCIENCE

Human emancipation cannot emerge from only one realm of necessity, one set of social relations. It cannot come from a transformation in the public realm that expects a merely reflexive transformation in the private realm. It must emerge from an understanding of the dialectical movement within and between the relations of reproduction and production that makes it entirely possible for historical change to be initiated within the social relations of reproduction.

(O'Brien, 1981, p. 157)

In this chapter I outline the method of analysis and activity that will be followed, and has been followed, in this study as I investigate what we must know to engage in curriculum reform and radical social education. As such this chapter adumbrates the historical, philosophical, conceptual and methodological contours of the idea of praxis - what some social theorists have called the tradition of political philosophy most urgently and precisely expressed in the words of Marx. I present these sides of the idea of praxis not in an exhaustive or even synoptic sense but as a means of demonstrating the implications for this study of particular historical interpretations of praxis as one instance of both normative social theory and practical

method. Any historical survey might reveal other traditions that incorporate theory and practice in concrete projects of world amelioration, but, I am concerned with the particular promise of Marxist and neo-Marxist interpretations of reflection laden practical activity. I seek to justify by implication that this kind of method has a more powerful mandate for attracting our professional and personal attention as curriculum theorists interested in radical curriculum change due to the potentiality of a Marxist or neo-Marxist praxis to realize, collectively and personally, the fundamental changes called for in radical curriculum theory than do other strategic sciences - some of which I will mention. I make the case that for curriculum theorists' best interests, a familiarity and appropriation of the theoretic and practical forms for praxiological inquiry is necessary in order to redeem their utopian interests. They alone must choose whether the curriculum theory they sponsor is to become a social practice of emancipation or a social practice of justification. Although no social theory can be locked into a frozen dualism, we must learn to speak our interests in the debate of social science theory as it has emerged historically but then to consider how it will be transcended.

I want, at this point, to mention my usage of the term 'practice' in distinction to the term 'praxis.' I use the former term through personal preference in the attempt to avoid philosophical dilettantism, in the same way as the

Marxist tradition has used 'praxis'. I recognize the cultural and linguistic difficulties associated with the use of praxis and want to absolve the concept from its common utilitarian focus such as "student teachers really only want practical information and techniques". Hence, the reader is begged to dissolve his commonsense association of my use of 'practice' or 'praxis' with efficiency and procedural technique, per se. But I frequently employ the adjectival form 'praxiological' or even 'praxiologic' to name a form of interest-seeking inquiry that is derived from the use of the concept 'practice'.

The method of practice or practical method I elaborate has to do with a form of inquiry which not only intervenes in the social and psychological world but involves and guides the transformation of that world. Marxist and non-Marxist conceptions represent a more elaborate, concrete form of practice than other traditions I will claim. Such inquiry goes beyond subjective idealism, and extends its projects beyond commonsense consciousness and practices. Critical conceptions of practice involve the negation and incorporation of commonsense consciousness, its contents, and the quasi-scientific traditions of materialism and idealism. This occurs through a dialectical incorporation of and advance from current historical practices whether reproductive or speculative to qualitatively new embodiments in transformative concrete practice.

Marxist or critical practice considers it necessary

not only to provide a theoretic account of institutional realities but to demonstrate the factors (social, political or methodological) that must be secured to permit the transition from a theoretic account to its absorption in practice while sustaining the unity of both moments of inquiry.

Neither materialism nor idealism are features of this method since no logical priority is given to the here-and-now of a pseudo-concreteness nor to an all revealing universalistic subjectivity. In effect critical practice seeks a reconciliation between the interests of these two traditions, as it does between the worlds of the concrete and the ideal, as it does between the sediment of historical tradition and the immediacy of the conscious present. Reconciliation, in this tradition, is accomplished not for chivalrous reasons but because the practical organization of socio-historical world is composed of these elements, in tension, dependent upon one another that limit and grant possibility to human action. Mens' consciousness, their institutions and their intentional activity that links them to the future are knowable, extendable spheres of relations that remain separable but interdependent spheres. Their conjunctions are world-sustaining or world-building.

To suggest that inquiry of this sort can attain strategic practical knowledge for its educational projects from men-on-the-street would be misguided since commonsense consciousness and its contents although presupposed in practical method cannot be taken for granted as a pure

material expression of critical thought. Commonsense consciousness is topicalized in practical inquiry because it is as necessary to understand any objective account of the social world yet it, too, is riven through with contradictions, deformations, with a whole way of life cognitively operative. Commonsense cultural practices, as does science for instance, encode the contradictory relations of human society which are not immediately accessible to observers or philosophers. As a result, practical method involves a casting up of the appearances of commonsense practices while, at the same time asking what the essence of these practices are in relation to the particular development of our socio-political and economic forms. Practical method aims at the dissolution of commonsense consciousness, and its transcendence in a dialectical negation of dominant, retarded forms of consciousness and society. To understand and realize persons' practical activity in a human scientific and objective sense, reflection and action are united in a higher, creative, globalized consciousness. The retarded forms of consciousness such as idealism, positivism, materialism or the teenaged forms of magical or animistic consciousness are partial fronts from which practical method as a transformative, reflective, revolutionary consciousness must supersede through organization. Practical method represents a way of life as much as it does a way of collective inquiry. We cannot afford to subscribe to the natural attitude of a

quasi-social science that considers practical activity in the world as self-evident, begging no explanation; and that considers the relations of men's actions to objects of meaning in direct and unproblematic correspondence. According to the story of ordinary consciousness' baldest form, whether of the street or in taxonomic, statistical sociology, it is alleged that the presence of theory and speculative discourse serves to mystify the opacity of everyday life - indicating a failure of nerve on the part of social theorists who are not real men. It is important to note just how close commonsense consciousness walks with contemporary, public philosophies of history and education. Radical curriculum change requires that we begin to specify through practical method the conditions that can shift persons from magical, through reflective to critical-practical consciousness. To the extent that commonsense consciousness is riddled with ideological deformations, it is not a knowledge of cultural form that has strategic importance for curriculum change. But this same consciousness is symptomatic of structural and moral crises in an advanced society; it represents a dominant form mediating understanding and mass activities and consequently must become a theoretic topic for praxiological inquiry. One task, then, of a critical-practical inquiry is to point up to its constituents in schools, in the streets, and in the academy are the social and class dimensions of our cognitive activities and organization of our physical space. How ironic it is that the story of

how commonsense consciousness thinks practical action does not consider the act of social transformation a practical one.

What has been the contemporary history of our consciousness of practice? The well-worn distinction of *en soi* of the proletariat holding consciousness, in itself or *en soi*, and consciousness for itself or *pour soi*, is particularly demarcating the everyday awareness of persons from a critical-reflective awareness. Quite often persons display a typical *en soi* consciousness of the world of everyday objects and events such that they find meaning inherent in the things they confront. The conception of the world as self-evidently knowable or ascertainable deny the active, constitutive powers of persons in actually making and shaping affairs. Hence the relation between objects and consciousness is flattened to a utilitarian calculus of speed or power or efficiency or profit, or surplus value. Anything that cannot be accounted for in this calculus of consciousness is impractical or speculative whether it be literary criticism, health care or economic production.

Habermas (1975) draws us to these relations at the level of state organization where a logic of public consciousness emerges that manipulates and emasculates the civic political intentions of persons in everyday life. With the state's emphasis on practical, participatory policy-making persons are drawn into massified depoliticized structures of public tradition. Here political activity is

reduced, as practical consciousness, to the consumption and production of policies and programs. By sustaining mass consciousness in a depoliticized form, the way is open to sustaining naivete, cliches, prejudices, and modernistic superstitions in key classes of the social order. Inhabited by a sense of the 'earnestly practical', persons act out their ordinary interests and life trajectories in an infinite good faith of anticipation.

In ancient Greek philosophy, the basis of contemporary Western philosophy, the practical, material world was disregarded. It was discarded as second order activity along with that of human labour. Free men were to cultivate and develop contemplation, intellectual activity, and the political state. Material practice in Greece was regarded as inferior activity and was considered to be the work of slaves since no correspondence existed in the Greek cosmos between mundane reproduction and the transformation of the human universe. Liberation acquires the character of freeing the person from material, reproductive toil in order that creative energy occurs in theory. Both Plato and Aristotle assign priority to a knowledge of essences. The social world, its structures and purposes, epitomized in the city state can receive direction from essential contemplation on universal forms but its maintenance as a material entity was the work of lesser social orders. In this respect theory is severed from practice. Aristotle can be seen to give a wider scope to theory's role in informing practical matters. Politics

was a slightly more legitimate form of applied theoretical activity scarcely less slavish than the task of rendering to matter. The quest for philosophy and politics was a mission and dialogue of ideas, and that this in turn was a conscious regulation of social and political life was considered worthy of the commitments of citizens.

Theory acquires a quasi-practical character once politics was recognized as an activity worthy of interest, as soon as knowledge is seen assuming a social and political function. Theory becomes practical in Greek society to the degree that it reduces enslavement to the material world. Aristotle living in an altered political structure in ancient Greece is driven to recognize that although theory and practice do mediate one another, they are essentially separable in the organization of the polis so that philosophers could not substitute as kings and the converse. Practical reason and theoretic reason become complementary in the life of the state. Yet the Platonic-Aristotelian world view still held that the highest elaboration of man's destiny was acquired through the theoretical life. Politically the nature of the theory-practice link was sustained by the structure of Greek society. This philosophical position combined as hegemony to secure the mode of production of Greek cities based upon castes of patricians, citizens and slaves. Each was anchored in part by the progressive debasement of human labour. Objects produced in Greek society usually acquired only a use rather than an exchange

145

value. Hence their worth was fixed only to their capacity to satisfy human needs. These products never became commodities in the sense of the contemporary capitalist West nor human labour a product to be valued, bought and sold. 2

The contemplative class considered production geared to the self-transformation of man, not to the domination of nature as the valued form of human activity - intellectual work. The social division of labour as an ideological and political ensemble could sustain the schism between contemplation and action, between theory and practice. Human nature, free activity, and the 'life of the mind' were associated in spiritual unison. The organization of work, of productive activity and political meaning systems corresponded to and were mediated in the Greek city states by a philosophical conception of praxis that mirrored the universe of eternal essences. The portrayal of this universe would at times reflect the social order that had unfolded as the social structure of the city states. I can go further to suggest that because ancient Greece constituted a slavery-based mode of production, its essential philosophical and economic categories were trapped in an ultimately non-expansionary or adaptive social-economic form. Hence the importance, for our purposes, of seeing how important a discourse of closure was for reproducing Greek society but also the brittle quality ideologically of this conception of practice. This appears to be true of most slave-owning

societies so that the relations between theory and practice, generically, have been ones of distantiation rather than explicit embracing of one another. The former conception of practice in societies such as Greece that has also made them vulnerable to technological change from outside cultures - and this disallowed the generation of political discourse that could respond to rationalizing forces in the event of economic transformations.

With the Renaissance in Europe and the rise of a nascent bourgeoisie the person was no longer considered as a passive object of the cosmos but as an active, subjective builder of the world. Human being was released through action rather than through contemplation. Reason, will, and action were considered motive forces in the transformation of material or external nature. Clearly, knowledge and its importance in transforming nature are linked to the development of the merchant and capitalist bourgeoisie. Theory and intellectual activity was actively used as a factor in mechanical practical problems and the new economic mode of production. Once again we can see how the organization of the social relations of production mediate with a formal, socially-latent corpus of knowledge in the development of science and technology directly instrumental in the forces of production. As the knowledge base shifts in its conception of theory, so the social division of labour and reward shifts dialectically from the repression

of slaves to the organization of free men with a commodity to sell. The shifts in social value that occurred in cultural practices such as philosophy, the mechanical arts, science and experimentation, arts and architecture all prefigure this change in the conception and redeemable value of practice seen for instance, in the work of Da Vinci, Bacon, More, and Descartes. Although according human labour an instrumental role in man's rise to the higher spiritual tasks, Thomas More in Utopia still saw contemplation as the pre-eminent labour.

Seventeenth and eighteenth century developments in the productive forces of European economies signalled a bourgeoisie ever more cognizant of the importance of science and technology as factors of economic expansion. It is argued that the Industrial Revolution (Bernal, 1969) represents a conjuncture of class interests, scientific shifts, and economic exigencies that reemphasized human labour's role in material practice. Rising global competition as a result of earlier mercantilist adventures intensified the need to dominate nature and free the social world of compulsions prejudicial to innovations in production and output. The focus, at this time, on the practical was how science and its derivatives of technology could hasten and intensify the technical dimensions of the production process. Virtually no concern lay with the effects or changes upon the social and cognitive organization of workers or craftsmen that arise from the scientific transformation of nature. To be sure some awareness amongst intellectuals, state officials and

entrepreneurs existed of the significance of the human transformation that paralleled an unconscious domination and commodification of nature, yet these effects upon the inner nature were never topicalized at the point of productive relations. The calculus of evaluation for economic or theoretic investment, effort and benefit was equally utilitarian. For philosophers, as for entrepreneurs, technology became the unity of theory and practice.

During the period of the enlightenment the growth of the positive sciences reflected a faith, particularly in France, that man's labour, the new sciences, and the perfectibility of culture would be expressed in technology. Rousseau was the exception in the mid-eighteenth century to the utilitarian Enlightenment beliefs in the material, productive and progress of nature as practical and theoretical culture. Human transformation through domination of nature yielded only a vile side of man that social labour coupled with mechanical technology led to the repression of authentic praxis. Human productive activity was the normative form of organization for groups such as the English political economists. Ricardo, Smith and others argued that the unseen hand of selfish industry guided by technological innovation would provide a measure of Commonwealth for all workers in the society. Human labour for this group was conceived as the generative force of all wealth and cultural practice. Yet it is due to their narrowed notion of human labour, and its social organization, that both Rousseau and the Marxist tradition were

to criticize ideologically and politically. Theory as a time bound perspective on the nature of man, and of knowledge, had not yet pervasively acknowledged the active, constitutive, social character of man's consciousness with its integral mediations in human labour. Nor would the new positive sciences admit of historical and class nature of their emergent theories; how their epistemological limits stemmed in part from the social interests preserved by particular conceptions of the world.

Marx's response to these conceptions of practice was two-fold. He attempts to answer in the more mature writings such as Capital and the Grundrisse that human labour, when confined to techno-economic activity, is reductionist of man's practice. He criticized the political economy school while incorporating its insights of human productive activity into a larger synthetic science of knowledge and society. By incorporating theoretic features of earlier ideological paradigms whether of economic production and innovation, or of consciousness and knowledge, or of social-strategic organization, he provides a more manifold, historical science reflective of man's creative, world-building interests that is self-critical of its own theoretic forms and of redundant social relations that fetter the necessity of human practice. By combining the socialism of St. Simon, the transcendental philosophy of Kant, and the political economy of Ricardo amongst other theorists, Marx attempts the recovery of a flattened conception of human labour or practice.

If we remember the Greek conception of the theory-practice link as emphasizing the contemplative subject of material forms, the philosophic correspondence with Kant can be made. If we remember the increased value placed upon material activity and technical proliferation of the late Renaissance and Enlightenment, the correspondence to political economy can be made. In both of these traditions the theory-practice link is, according to Marx, deformed and insufficient to account for the full historical and creative possibilities of human practice, that is man, as seen situated in society, in history. By uniting different theoretic traditions with their respective explanatory interests, Marx displays the moments by which man transforms material nature, social reality, and consciousness in an ever-present dialectic. Transcending the philosophy of Descartes, Kant and Hegel but not dissolving those theoretic moments, Marx establishes the subjective and objective worlds as distinct yet totally interdependent spheres of human relations. By assigning priority to the integrity and mutual dependence of subject and object, Marx revolutionizes philosophy to human science and restores a critical, creative tangibility to human labour. With a totalized conception of theory and practice or praxis, Marx can begin to ground ideological criticism to the nature of the progressive humanization of the species. Hence production and society-in-history become the correlates of subject and object in complementary unity.

So far what has been the upshot for philosophical or theoretical practice? The validity of any philosophy is secured if it retains the relation between its key problems and that of practical human activity. Philosophy's obstacles or problems are those of a human science and are as much theoretical as practical. For instance, both are involved in the resolution of collective practice of classes and persons needlessly deformed by the social relations of money, private property and the state. These obstacles to the progressive humanization of man require reflective praxis and material praxis such that their effects are understood, generalized, and strategically dissolved by all affected persons in a totalized, creative praxis. The historical deformations of exploitative economic modes, social class structures, and interest-laden linguistic practices maintain one-sided, reductionist conceptions of the theory-practice ensemble and hence what becomes the dominant organizing motif of different but unequal societies. I have argued this in the case of Greek city states, mediæval, renaissance and post-enlightenment Europe.³ Clearly, transformations of society or what passes as modes of social reform are tied to the prevalent notion of the practical in different social formations. This form of theoretic practice is, in its turn, mediated by relations inscribed within the specific economic mode of production as is the realm of cultural-ideological practice. Hence, violent, revolutionary transformations or invasion were the typical outcomes for change in ancient

Greek states while some bourgeois revolutions in Europe have occurred with less profound transformations, England, France, and Holland being cases in point. In our own time, however, extensive rhetoric, there is pessimism about the possibility of real social change through reformism and gradualism. The political-ideological porosity of the advanced capitalist societies obscures the tenacity and complexity of everyday life in monitored, organized economies. Marx was particularly critical of the reformism of social democracy under the Second International. He points to the delusions of a praxis based on vulgar economism where societal change emerges inevitably or to that based on political moral suasion typically expressed by the social democratic movement. Each tendency occludes man's role practically and conceptually in institutional reconstruction. That is:

... the most emphatic recognition of the revolutionary energy, revolutionary creative genius, and revolutionary initiative of the masses and also, of course, of individuals, groups, organizations and parties that are able to discover and achieve contact with one or another class.

(Lenin, 1964, v. 13, p. 36)

The role of theory in the above sense, then, is to portray historically the subjective and objective conditions under which radical social change can be achieved. For my purposes theory that addresses different fronts in this study of curriculum reform is immanently practical as well as practically informative or generalizable within projects.

of programmatic deliberation that are organized by different kinds of curriculum workers. I ask, too, how much longer the curriculum field can hold off examining the society it is situated within as economic, political and cultural contradictions deepen? Surely, a portrayal of our work in curriculum reform is called for as one instance of a wider social practice in order that we can truly recover and reassemble an historical consciousness of praxis. This requires as this study makes clear an opening to diverse intellectual traditions so that through their touching arcs, we come to see the spectrum of truth and practice in everyday life.

It is difficult to raise the question of praxis fruitfully in a time of immense but deceptive closure in philosophical circles and when the possibilities for radical change in our society seem unclear. But it is from working within a Marxist and neo-Marxist tradition, coupled with the recognition that political alternatives could emerge from organized capitalism, that reflective, material, and revolutionary practice could be raised as a primary topic of investigation. Practical, radical education projects of which this study points to are in the position of theory that anticipates the maturation of subjective and objective conditions for radical intervention before they present themselves practically. On the other hand in an educative field such as curriculum, the practical intervention requires this theoretic anticipation so that its strategies make sense with persons in deliberation, in schools, in writing groups as concrete

possibilities. Marx, in a long history of human ventures, apparently is the first to see the essence of man's theoretical-practical being, the nature and course of this being in world and self-transformation. Curriculum theory as a human science must recognize the unity of theory and practice and their relative autonomy if its participants, as social and historical beings, are to be granted a self-determining future.

Let us approach something of an outline of the dialectic in Hegel and Marx' method. Progress or development in the natural or social worlds, for Hegel, meant an act of overcoming of the immediately present signs of reality. Practices, forms, institutional, intellectual or political, were particular instances of reality that had to be overcome and so promoted to their higher stages of potentiality. The process of overcoming and promotion to the future, was a means of realizing the universal essence as reality. Rather than an uncritical acceptance of the world of immediate sense appearance as was the tendency of the positive sciences, Hegel posits the historical principle of transition. We see, too, in Marx that a distinction is forged between the appearance and the essence of social reality; that man, through inquiry, is to go beyond the prima facie density of social life, its forms and cultural practices in order to 'recover its historical presuppositions'. What this movement achieves is critique.

The forms and practices as resistances in the social world are explained in terms of their origins

and the mediations of persons in the course of the evaluation of these forms and practices. The everyday routine density is no less real as an appearance that confronts us and slaps us in the face as we 'do our washing' so to speak. The recognition and critique of this everyday but historically mediated process is accomplished but also its truth is seen as a 'world-historical' process promoted in Hegel's time by the state as an absolute construction and by the proletariat in Marx's time. Each accomplishes, if unfettered, the development of the 'universal society' of emancipation. The notion of a realized end-point of emancipation is problematic when interpreting the practical implications of a Marxist or neo-Marxist tradition. My position in this study is that no end-point is sensibly attainable politically or intellectually - only the conditions for organizing practical enlightenment can be prefigured. What is of interest to me is that the dialectical method elaborated by Hegel and by Marx has some obvious similarities which should interest those contributing to practical method. (The fact that there is a gulf of difference as to the ontological character of Hegelian philosophy and Marxist practice should not deter us presently.) What I find in parallel between the respective methods of analysis and practice are the four stages of embracing, negating, overcoming and reconciling immediate structures of reality. Both Marx and Hegel start off from an immediate apprehension critical of reality. Particular social forms are identified in the context and

function of a society. These forms are not
criticism or negation from external sources.
both Hegel and Marx then do in fact have
an understanding of these forms in a dialectical
comprehension of the social totality. This is
philosophical exercise since through criticism
able to overcome the partial determination which
have upon men's consciousness. This process
negation a freeing awareness of the possibilities
abilities of their own life projects. The
social reality is experienced as contradiction
relations, incomplete, deformed, such that if
intellectually and practically becomes a
relation. The partial relations of the world
need to be seen as only moments in a
process. Ideological linguistic practices,
or particular social relations of production
through shifts in self-consciousness and
praxis with Marx, or in the advancement of
to absolute knowledge with Hegel. Both are
social learning as both contain evaluative
rational knowledge, universality and human
progress. Each sharply differs in the kind
the shifts towards universal consciousness as
each difference in the political consequences
of the method. It is important to note,
particularly with Marx, that the implications
of his own practical analysis were simultaneously

scientific, philosophical and normative. The primary issue of praxis as a transcendent theoretic-practical inquiry is to reconstitute a human science that reconciles ideological perspectives of social science caught in past social formations with the practical organization of persons in pursuit of their global interests in economic, social, and psychological freedom.

Much has been said (Avinieri, 1969, McLellan, 1973) about the polemics against the proponents of an idealist criticism. These theorists insist that change in personal consciousness must accompany material and economic revolutionary activity. Marx was often skeptical of the young Hegelians' program that mass action in the absence of shifts in consciousness or attitude would result in the re-institution of dogmatism of the state or party in a new regime. Structural economic transformation has not dissolved the webs of animism, prejudice, and violence towards others that is found in socialist or communist regimes of the twentieth century. Early critical theory from Korsch, Adorno and Horkheimer onward has made much of the logical strategic importance of encouraging community discourse that is ethical, universal and rational. I make a case for seeing discourse and discourse shifts integral to cultural practices and as real as other material conditions of social life.

This study is relevant, in some measure, as a tradition of neo-Marxist inquiry. This tradition as has the study,

so far, argued that institutionalizing the social world is 'practically' constituted. Although Hegel's philosophy suggests that the circumstances of our world, and our knowledge of it, can be critically-practically transformed in congruence with the virtual, universal aspects of what they could become. Both Hegel's and Marx's point is that the higher stage of development (political, cultural, economic) is historically inscribed within the activities of persons' social and collective practice, that is, it is inscribed as a virtual becoming in the "ensemble of social relations." (Marx, 1970, p. 122). Theory, it is argued, must reveal the social world as sensuous, practical activity in order to promote radical change in circumstances, which is a revolutionary and qualitative shift. But it is self-consciousness and material practice that coincide in truly radical change in any social formation. It is only in this state of self-directed consciousness, organization, and material revolution that social planning becomes human and universal. Critical-practical activity invests participants with the historical legacy to act on their personal and collectively revealed interests. It is through careful inquiry and educative processes, that move persons to self-consciousness, that the historical dialectic of Marx and Hegel is realized as a rational, collective community or society. A limitation placed on the development of new social forms is the level of productive forces. In our case

time it is made more complex by the interpenetration of technocultural relations within the mode of production. Any debate on social reform must recognize these qualitative changes, since Marx's time, in the social formation of organized capitalism. As a collectivity and as individuals we are always in the position of throwing out "newly authenticated stages of development" so that truth and history are continually reposed as practical problems. I turn now to the contributions of critical theory for our understanding of practice; the core of the practical method.

This study considers that the Frankfurt school of critical social theory presently best exemplifies the legacy of Hegelian Marxism both intellectually and methodologically. The core of the practical method, and of the primary structure of this chapter is reflected in my practical synthesis for curriculum theory of the tradition of critical theory as embodied in three pre-eminent theorists of that tradition. I identify as first generation representatives, Theodor Adorno, Max Horkheimer and one second generation representative as Jurgen Habermas as the currently most-advanced expressions intellectually and politically of the transition to post-Marxist practice. The transitional nature of their work will emerge through my writings and their application as curriculum practice. This is not meant to imply a transitoriness or depreciation of their work but to suggest, à la philosophy of science, that it recognizes cultural, moral and structural crises in organized global capitalism. It is

prepared to examine these crises, and to prescribe the kind of normative life and theoretic collectives that natural and human scientists must struggle to build. The second generation critical theory 1930-80 in North America and Europe addresses the questions of the symptoms and anodynes of everyday life and inquiry for intellectuals and citizens of the late twentieth century. It offers no solutions, political or aesthetic, nor any schemes of global, ethical reconstruction. This requires the emergence and gathering of a new human science. Curriculum studies, in my view, are strategically placed to contribute to this project.

Accordingly, I will briefly characterize some of the theory and methodological interests of Max Horkheimer as a way of travelling this journey to a new human science. Horkheimer had been concerned, during the period 1930-1950, with the antagonisms and complementarity between what he identified as critical theory and traditional theory as two world theoretic views of practice. In a 1937 essay he portrays traditional theory in terms that descriptive, hypothetical, deductive social science would recognize today:

The phenomenologically oriented sociologist will indeed claim that once an essential law has been ascertained every particular instance will, beyond any doubt exemplify the law. There is always, on the one hand, the conceptually formulated knowledge and, on the other, the facts to be subsumed under it. Such a subsumption or establishing a relation between the simple perception or verification of a fact and the conceptual structure of our knowing is

called its theoretic explanation.
(Horkheimer, 1972, p. 192)

Horkheimer goes on to, in line with the socially 'promotive' tendency of critical theory, situate this bourgeois science in the context of the development of particular, in this case European, societies. Clearly, this was the knowledge and means of generating knowledge of the newly ascendant class in the eighteenth century. This was scientific theory that had the function of rupturing the socioeconomic status quo. It was promotive and transformative in disrupting older, redundant cultural-intellectual practices, the legacies of medieval, feudal, and theologically-monistic structures. It had an active, generative role in technological practice as English political economy of the eighteenth century demonstrated. Horkheimer warns that, similar to the 'consciousness' of earlier social formations, theoretic practice of one social formation can retard and obscure the necessary interests and developments of new social relations. The repressive, ideological function of cultural, material forms emerges in social life when persons 'forget' the origins of social knowledge and institutions. When theory becomes free-floating, or "absolutized" in men's minds, it obscures the relation between individual existence and social change. This latter theme is one that pre-occupies the second generation critical theorists, evidenced particularly in the work of Habermas (1975). In a society of extreme differentiation where a sense of community life as a moral

anchor has been disrupted, what principles and values of conduct are available for a person, for an individual, for a curriculum theory, and as citizens, with respect to the various categories of morality and responsibility, in the various practices of the good life? Horkheimer and Adorno, as well as others in the critical theory tradition grapple with these issues. As theorists they often embark from points of epistemological or methodological procedure and arrive at the political implications of this theory in the society at large. In the period of bourgeois ascendancy and the elaboration of the mode of capitalism, certain kinds of theoretical practices have progressively sedimented in the intellectual, formal, and cultural culture, then what kinds of civic competence or opportunity need be acquired in order to properly resist these practices of life (as politicized culture)? The question becomes a methodological and practical one for human science when persons acknowledge that science historically has confirmed the mode of existence of powerful groups in each social formation, but typically has only justified the position of one class at the expense of others. Hence, the importance of a science, which in separating its subject and object, methodologically becomes a reproductive force politically and economically once it has been diffused formally and popularly through culture. This dualism gives rise, according to Horkheimer, to a situation where individuals are abstract yet conscious.

107

in a 'society that is concrete yet blind'. The experience of society as a totally administered structure beyond the individual is one that is traceable, I argue, to the accent given by the theoretic practice of bourgeois science. The ascendancy, and consolidations of social relations based on radical dualism at the points of production penetrate the lifeworld sufficiently that the self-experience of persons is retarded to that of monads. Through this kind of analysis, critical theory has demonstrated its interest in conjoining theories of knowledge with theories of society.

Dualistic, descriptive social theory or what Horkheimer has called traditional theory expresses a definite conception of practice - one that corresponds more closely with what Marx and others had termed abstract materialism or even economism. It is world-creative in its material praxis and cannot be discounted as integral, Horkheimer would maintain to social analysis. Yet, despite its materially productive outcomes, in the domination of nature and in technical development 'traditional theory', it is an outcome of the social practices of definite groups in society having existed under certain political conditions. It is, in principle, a theoretic practice which if generalized, extended, and detached as popular discourse both limiting and regressive of alternative intellectual and political arrangements. As a theoretical activity, in its own right, it presents a more unified theoretical practice in the tradition of Marx and

Hegel exemplifies the distinction between
reason and objective historical development.
Theoretic practice carries with it a certain

tice struggles to become human science of analysis and
judgement concurrently. Society can "lack reason" (Horkheimer,
1972A, p. 208) when the

concepts used by men of the critical
mind always contain a tension between
recognition of the categories of soci-
ety and the realization that they must
also be condemned since the structures
they represent are not the creations
of a 'unified, self-conscious will'.
(Horkheimer, 1972, p. 187)

The role of critical theory within its research program is that of enabling and helping to citizens the technical, political and cultural possibilities that are suppressed but within the social structures we commonly inhabit. In this sense critical theoretic practice, and the practical method of this study, do not escape from but embrace the utopian potential that men's educational and political projects contain. Inquiry as critical theory, where organization permits has a three-fold task of portraying historical, structural tendencies, portraying these tendencies through a discourse that secures persons in their immediacy and understanding in a promotive, strategic organization of persons' interests. Critical theoretical practice is distinct in that through social research, as a form of dialectical logic, civic competence develops in persons who by virtue of being active, conscious, and collaborative in their projects engage in a continual reconstruction of their life-worlds secure in solidarity and historical consciousness. Its project introduces us as citizens and theorists alike to the "antagonistic whole of our life". (Horkheimer, 1972A)

It is this whole which at one and the same time in its alienated objectivity creates and sustains traditional theory, critical theory as Reason and the perennial possibility of greater rational self-determination.

(Kilminster, 1979, p. 194)

social reality. For instance, merely calling a teacher's training or curriculum project "critically reflecting" will not necessarily make it so, yet the traditional organization of content and pedagogy on key structural themes could well determine future practice. It is up to praxiological inquiry to become aware of the 'illocutionary force' of particular forms of discourse upon social reality. (This point will be taken up later).

Daily do I get more and more convinced that theoretical work achieves more in the long run than practical. Once the realm of ideas is revolutionized, actuality does not hold out.

(Hegel in Avineri, 1972, p. 68)

3. Persons doing curriculum or social inquiry in this tradition are faced with two classes of struggle that must be recognized and mastered in their theory and practice. One has to do with being open to the nature-like historical tendencies in society, for example the logic of capital investment shifts or state depoliticization strategies, given the basic structure of society. This means developing an awareness of how it affects you personally in your family, vocational, and political decisions and hence incorporating this awareness of the corrective dimensions in your research protocol. A second struggle lies with coming to embrace the kinds of relations and events that need to be sponsored in

Praxiological inquiry draws from linked but separate traditions in the history of sociology. Empirical, descriptive sociology has more recently been used as a social technology of human engineering and for administrative management. Critical sociology has been concerned throughout its varied career with ideological criticism and has organized practical-interpretive inquiry into social ends. In this respect, critical sociology is mobilized and organized by an emancipatory interest.

What accompanies this interest of critical sociology is a global program that grounds across disciplinary fronts yet is theoretic, practical, and political in its research character. This program has correspondent world-views of knowledge, society, and man which form its background contexts of discovery, theorization, truth-generation and social amelioration. These kinds of practical, historical connections are not made within a sociology of research based on logical empiricism.

Praxiological inquiry writes both of these historical lineages of sociology in a global, ethical program of research and social action. The kernel of praxiological

135
Theodor Adorno, Jürgen Habermas, Jürgen Habermas, and Jürgen Habermas, in particular, take upon themselves the two self-conscious complementary vocations of citizen and scientist.

Central to what we cultivate as a self-conscious praxiological community is the idea of practical reason. This is the usage of reason as Kant, Hegel, Feuerbach and Marx used in its progressively materialist refinement as the active, constitutive subject of institution and history. This notion of reason connects, as a deliberative force, with the praxis of conscious society-building. Social practice, following practical reason as a human-species interest, means the "reasonable conduct of life" at the same time as persons engage in progressively global, historical dialogue with divergent others. Practical reason, as a quality and motive force we all possess in an unsuppressed state, means that the development of a science of social affairs in principle is one that guides practical conduct. Husserl linked reason with the humanization or radical transformation of labour in full cognizance of the origins of our self-formation as of each others' collective and global formation. Habermas discusses the same process as being the "full transparency of man". Individual identity and autonomy are predicated, in part, on the idealized society, or fragments of its organization that will eliminate human misery or redundancy in work and consumption. Practical reason, then, informs a critical science that is simultaneously

revolutionary transformation of society
at a personal level. The praxiology
achieves an understanding of the
for theorists and practitioners in social
practical questions of particular interest. It
grates the questions this praxiology presents
communicative organizations of which individuals
acquire their identities. Praxiology becomes
urgency as a research program in that it
it theorises societal change, in theoretical and
ical formations, as a kind of practical philosophy. It
also harnesses these taxonomic and interpretive tools
in a projective urgency of what and why we should be
aware of and do in the future: to plan and act.
Hence, we struggle through praxiology to a new
consciousness, to relations of the fully-open world,
economic and cultural life, and to relations of ethical
ethical discourse. Radnitzky (1973) provides a concrete
example of praxiology intervening with social life.

If critical sociology shows that, say, social emancipation which is bought at the price of increasing regimentation is not the best property, then at the same time, emancipation is not the best alternative, then such a society is not the best society. It is its contribution to the best society that remains a question of praxiology.

(Radnitzky, 1973)

technically points to the popular but under-analysed symptoms of political life in advanced industrial countries that the Frankfurt school has written about (Marcuse, 1964 and Schroyer, 1973). For my interests, the overside of formal democracy in the open societies of Europe and North America is the ruddy-checked faith in the idea of science as progress; the hail-fellow-well-met syndrome at the level of culture and a verbal utopianism in political life. These features of organized life under advanced capitalism bespeak of a society in all its dominant forms and life-sustaining practices based solely upon an economic-technical calculus of ends and means. Curriculum reform as instance of social amelioration or adjustment is one expression of political contingency planning to control crises of dissent and credibility amongst different social classes in the population. Curriculum reform, naively or insidiously, becomes a process of wish-fulfillment on behalf of the clients and entrepreneurs of school environments. Repeatedly, the faith in the rhetoric and measures of reform comes crashing down often engulfing persons in resignation, 'system-cynicism', or indifferent opportunism as common responses to a milieu they live and work in but only partially understand.

Praxiology as a programmatic response to this pessimism presupposes that identity and autonomy as human expressions of emancipation are possible. That to distance or marginalize oneself, and to theorize, are important

means of criticism and opposition. The contradictory 'political participation' and 'intellectual tolerance' is descriptive in the capitalist states. The free flow of pluralist alternatives in the culture at large masks an inability for communication to touch ground with critical analysis, or radical strategies, or the nightmares of doubt that lurk behind the smiling personae of every day lives. The 'public language' of policy-talk or of popular solutions or considerations, as glosses on the possibilities for conceiving of radical social alternatives. The public language of conventional intellectual communities is rarely in evidence as a creative deliberative invitation to students, factory or office persons, union members, or neighbourhood groups to question the way of life they follow, or to connect for them their private troubles with an historical backdrop that could secure confidence in themselves. 5

... they have brought into focus the paradox of tolerance, the problem of the tyranny of the majority and of the idolatry of the Western style of life which tends to "deify" man, to reduce the individual to a functional task, and to depreciate "non-Western" forms of life. They recognize that technological and specialisation has led to a sense of estrangement which Marx could not have foreseen, that the Western capitalist and Eastern socialist systems have not yet adjusted themselves to their own almost technological alienation. Theology and natural science are not these the systems which have not yet solved problems. ... raising questions...

solutions.

(Radnitzky, 1973, p. 350)

Horkheimer, Adorno, Marcuse, Habermas and many others are important in that they demystify the political cultural relations reproducing social life in the administered societies. It still remains to be seen whether they have 'reconnected theory and practice' as the critical-practical, deliberative realization of the good life. Curriculum studies as a praxiology of desire is one vantage point that can take up these questions. I take up now a few considerations that lie behind the construction of practical method and which ought to be borne in mind by the community of readers of this kind of inquiry.

Susan Sontag in an 1975 interview in Salmagundi, said, "In my opinion, the only intelligence worth defending is critical, dialectical, skeptical, desimplifying" (Globe and Mail reprint, February 19, 1983). So it is with this study in its representation of social and curriculum inquiry that goes beyond the bounds of conventional social research and critical social science in its bravado, its practical, ethical syntheses, and I believe in its power to know and change curriculum practice. This means, too, that I break often with accepted methodological canons whether in exact social science or in the alternative practices of qualitative or materialist inquiries. In a single work, the practice of this inquiry, this practical method, is inconsistent,

uneven and contradictory in the way that it
embeds itself in the fabric of our
it borrows from, but not in the force of
contours of our societies, creating a
of our work in organized education. This
frequent analogies to history that we
make when extolling the virtues of the
that 'the history of man and nations is
lively, more subtle and more multifaceted
methodologist or best historian can imagine
complex of accidents and conjunctions that
followed by methodologists can ever capture.

This study argues, in its ongoing
practical method, that epistemological
condition in my attempt to understand
tical action in a primarily unknown entity -
of curriculum reform. Standard epistemological
deemed proper for the subject matter of
organization of decision-making do not
yielding of 'new facts' or some
chological principles. Monological
will not cultivate the educative
because it prevents our reaching
attitude. In part, this excludes
integration of personality
ship since monological consistency

By compression, like a Chinese lady's foot, every part of human nature which stands out prominently, and tends to make a person markedly different in outline....

(quoted in Feyerabend, 1975, p. 20)

I work in this study for a kind of scientific practice that increases psychological, social, and political liberty, simultaneous with the unearthing of the mysteries of the material and the social worlds. To the extent that it is necessary for problem clarity. I break with traditional procedures of social research protocol; I have rejected the systematic proliferation of assertion and evidence and the fetishism of disciplinary consistency and the linearity of singly hypothesis elaboration. This irreverence is a signal feature, I argue, of praxiological research and its internal division and context of labour. I quote slightly embarrassingly from a portrait of Niels Bohr's work and life:

He would never try to outline any finished picture, but would patiently go through all the phases of the development of a problem, starting from some apparent paradox, and gradually leading to its elucidation. In fact, he never regarded achieved results in any other light than as starting points for further exploration. In speculating about the prospects of some line of investigation, he would dismiss the usual consideration of simplicity, elegance or even consistency with the remark that such qualities can only properly be judged after the event.

(in Rozental, editor, 1967, p. 117)

If we are to embark on new global philosophy and new human science, organized in part by collectives of practical

method, we, as divergent communities, in our struggles to describe and understand new relations encounter the tyranny of sedimented speech in which no discovery and no progress is radically possible. Feyerabend (1975) discusses the difficulties for a historicized scientific practice to penetrate the 'traditional categories' of everyday speech and that includes scientific thinking that portray 'false thought and action' of a technicized praxis. He proposes 'dialectic thought' as a means to 'dissolve into nothing the detailed determinations of the understanding' that formal logic convenes.⁶ Closely connected to the struggle of historicized science for linguistic-political renewal in conceptual and popular structures is the meaning that we assign the idea of progress. Progress according to Feyerabend takes on multiple meanings according to different methodological fashion. It is important to recognize it is a word that must be given key political and cultural content and to realize the unstated historical sediments it has for most persons. Progress as in progressivism suggests a view of society, of knowledge, and of the person that is historically and structurally specific. We must be prepared to reconsider explicitly the utopian and political contents of progress in any conceptual or cognitive shifts that accompany praxiological inquiry. Progress, for instance in the history of science, has often connoted to grim-faced, hardened men of natural science that parsimony in theory and the exclusion of speculative alternatives brought assumptions

closer to empirical reality and hence success - that is, the truth about nature. Feyerabend points out that instead,

suspicion arises that the absence of major difficulties of normal science is a result of the decrease of empirical content brought about by the elimination of alternatives, and of facts that can be discovered with their help.

(Feyerabend, 1975, p. 43)

Theory in these circumstances is successful because no case can be made that could falsify its assertions. 'Success' as ideology is achieved by the self-sustenance of the theory citing its own evidence as support for its correspondence with reality. Political implications arise when scientific, social and economic decisions are based on this body of myth which has reached deliberative and justificatory closure.

Much of Marxist historiography, and the small uneven part this study plays in it, is impelled to recognize that science is a contradictory historical enterprise that perhaps is both elegant sophisticated system, diffuse speculative cosmic anticipation of physical or social tendencies, and redundant encrustations of outdated theories. The yield from scientific practice comes from the exchange and contrast of these conflicting positions and the 'unevenness' of their development. The notion of Marx, in The Poverty of Philosophy, concerning the lag and the leap of cultural practices in contrast to the modes of material production suggest parallels between the development of capitalism in

different societies and the contradictory nature of scientific revolutions. How is it that advances in cybernetic, or high energy physical theory can co-exist along side the moribund structures of empiricist social science, or pedagogic philosophies - particularly in the advanced global economies? Why are measures of social control, or social reform in our societies articulated through the social thought or natural philosophy of the seventeenth and eighteenth century? These considerations imply that it is not science itself in its 'unevenness' that must do self-inquiry but that a world view of science-in-society-in the global community must be a root image for doing self-reflexive, ethical science. At this stage our inquiry can be nothing but a 'verbal gesture', an invitation to participate deliberately in critical theoretical practice. And to those teen-aged positivists of traditional social theory and falsificationism who yearn for the 'absolute certitude' of a dubious and falsified epistemic past Horkheimer admits that

There are no general criteria for judging the critical theory as a whole, for it is always based on the recurrence of events and thus on a self-producing totality.

(Horkheimer, 1972A, p. 67)

It must be remembered that the cry for an empirical correspondence and hence 'theoretical adequacy', with an imagined other society, and which it is critical theory's commitment to realize can only occur when that imagined new social order emerges through human praxis - as partial a realization

as this alternative social formation might become. Yet it is only in this transitory period, when the imagined order emerges that there is likely to be equivalence between theoretic criteria and the state of a present society in a traditional theory-fact unity. For to follow the developmental logic of critical theory, new social and historical tendencies emerge as conditions shift always in anticipation of fuller self-determining, rational societies - here theory, in the critical sense incorporates the theoretic essence of the older, superseded forms while it promotes a practical-theorisation of the future.

RUDIMENTS OF THE PRACTICAL METHOD (AS GROUNDED THROUGH THE THREE NECESSARY PHASES OF ENLIGHTENMENT)

This section of the methodological development of the study delineates the methodological core of the practical method. This will entail a specification of its structure and procedures, the functions to be assumed by the investigator, and the capacity of knowledge and action that can be generated through the practical method. In my formulation, based in the tradition of Marxist philosophy of praxis, I outline three essential methodical elements that I argue must occur for participants in any inquiry into cultural forms and practices - in this case the organization and planning of curriculum reform. The elements are freighted with ethical, epistemological, conceptual and practical leanings. The creative dimension of this practical method is the particular synthesis and accent I give to it as a

methodological procedure for reconceptualist curriculum work. I identify the three phases as immanent criticism, negative dialectics, and public discourse as analytically separable phases of theory and action. In practice this method expresses an organic unity bound up with participants and the selected problem for study. One could initiate the process of inquiry with immanent criticism although starting with other moments of the method is conceivable. The latter situation is more likely if it is a case of stepping into ongoing research or criticism, practical action, or consensus-formation in the research, development, or citizen groups. Immanent criticism I suggest represents the existential and structural identification of a problem as a problem in curriculum inquiry. Negative dialectics as a second phase inquires critical - ethical interpretation of the problem in its conceptual and ethical dimensions in the attempt to cultivate personal and collective familiarity with the problem in shared social contexts. A value position is declared regarding the historical fate of the curricular problem as expressive of retarded or progressive social relations. Finally, the latent energies of participants in this critical-practical inquiry are mobilized discursively, politically, and possibly collectively as a grounded action laden resolution to the curricular problem under study. I am intellectually indebted to the early Marx, to the early Georg Lukacs, Karl Korsch, Max Horkheimer, Theodor Adorno, and Jurgen Habermas for the elements of this

formulation. The practical synthesis is mine alone, particularly for curriculum studies, but I still stand on the shoulders of giants in doing so.

The Idea of Practical Method

Figure 1

In characterizing Horkheimer's contributions to this synthesis of practical method I draw primarily from the early period or first generation of critical theory work; that is, the period 1930-50 wherein the Institute for Social Research was established and the exile to America occurred. I do this because of the fertility of Horkheimer's ideas of those years for the practical method. After 1950, a number of critical theorists returned to Europe, the pace of their intellectual work shifted, and the emergence of a second generation in critical theory was evident. Throughout the history of the Institute and Horkheimer's writings there is a strain that seeks to connect philosophy and science, fact and value, criticism and objectivity in reconceived ways.

Horkheimer's project in this light was first and foremost as a sociologist in the tradition of Marx. He draws

extensively in his writings on Hegel's work on dialectical thought. Concerned with a critique of knowledge and society Horkheimer indicates that these activities must be grounded in a context of historical and human interests. It is Hegel's contribution in the Phenomenology of Mind, to see a particular relation between subject, object, and reason in history. Consciousness, as the subject, is defined as the motive force of world knowledge. The mundane, object world is set off as alien to consciousness. Yet through historical progress the subject as a process realizes it is implicated in the object world as one part of its own construction. While the socio-historical world, hence constituted, requires the moment of subject and object constitution as an interdependence, these same realms are in practical opposition to one another. There is both identity and antagonism between subject consciousness, and object world as materiality. By materializing Hegel as do Marx and Feuerbach we find that the totality formed of subject and object in world praxis is composed of a complexity of relations in continuous reconstruction. This finds institutional expression in the elaboration of consciousness in persons, in classes and in knowledge forms as it does in the material objectifications of human labour. Instances of the latter are the economic organization of production, the social and material appropriation of nature in institutional forms. It is the sense of determinate negation or the motive principle of the dialectic

in contradiction, transcendence, and resolution of personal and collective antagonism toward cumulative sediments in forms of higher social learning and material appropriation that interests Horkheimer. For with the possibility of development of a more generalized reflective attitude in world cultures persons are bound to knowledge or ideology critique. Since subject-object relations are historically mediated knowledge forms become open to our understanding through criticism and hence to their supersession in new forms - mediated by changing loci of relations. New forms of consciousness embedded in the cultural practices of knowledge generally correspond to new social formations in which new antagonism reside - whether political, economic or cultural.

Horkheimer takes Hegel to mean that knowledge critique, as one project of transformative activity points up the essential limitedness, partiality or dogmatism of particular concepts, ideas, or practices in the current social totality. Each fragment of conceptual tradition is superseded in itself but incorporated in a new organicity of relations, concepts, and intentions. Hence history is being made continually present. The progress of the subject object or materials and dialectic while ongoing is not pre-determined in terms of social-political ends by 'history' nor can we vouch safe the abolition of contradictions, of suffering, or of the increasing self-determination of persons. What critical practical inquiry must recognize

is that progressive emancipation from redundant conditions is a continuous project but men can exert some control over the social and cultural practices of reproduction. These possibilities are never once and for all clear to persons in the role as active subjects. Criticism and practice must clear the opacity that history leaves and restore the awareness and confidence amongst persons that they can begin to appropriate their personal and collective destinies. Practice not only sponsors the cultural organization of persons together but allows the question of how to act and what to build as socio-historical projects against the tendency to self-estrangement in the world of social and material objects. To conclude:

Concepts like theory and knowledge must, of course, at any given time have a clear meaning, since only when they are described or defined, however inadequately, can they be understood and applied. But dialectical materialism takes such meanings to be abstractions formed within the context of the contemporary situation out of materials supplied by the past, and not fixed, changeless elements on which the future is to be built. ... The application, therefore, of definitions constructed in the context of the contemporary situation or, what comes to the same thing, the contemporary signification of these concepts can some day become meaningless. ... the image of an endless process involving the simple realities "knowledge" and "object" proves to be an hypostatizing of abstract significations. Such absolutizing is the other side of the exaggerated relativization of science by many Kantian and other idealist trends.

(Horkheimer, 1972A, CT, p 31)

HORKHEIMER'S CONTRIBUTION AS A MOMENT OF IMMANENT CRITICISM

It should be noted in the context of this methodological portrayal that there is no one conventionalized approach for understanding and appropriating the relations between subject and object, particular and universal that this kind of study convenes. The methodological procedures remain for re-searching each complex of intentioned relations whether in curriculum reform or other social relations. The historical work, arising, socio-empirical results and action vary with each case.

1. It is the breach between word and deed, concept and object, theory and empirical reality that is to be investigated as part of immanent criticism according to Horkheimer. The presence of this hypostatized duality is not to be collapsed, nor is to be seen as infinitely fixed. What we refer to here would be critical theory's interest in occupying the tension between the historical reality of an institution, or practice or event and the conceptual structures that are meant to demarcate it. The intent is to identify this historical-empirical-conceptual schism, to understand the relations between the two but then to supersede these relations. The gaps between word and deed take on specific historical-political meanings in a recognized societal era - in our case the bourgeois formation of monopoly and organized capitalism.

Immanent criticism is particularly important for knowledge critique of dominant ideological practices as they have sedimented the popular culture and consciousness of everyday life. Immanent criticism in our era is intent upon revealing the false claims to universality that reside in the symbolic and economic practices when in fact the partiality of popular claims is manifest upon "deeper" criticism. For instance, institutions such as law, wage labour, the market economy, the idea of individual pursuit of freedom formally 'represent' universal principles of justice, equality, and freedom - echoes of the earlier liberal era of an ascendent class - which now have no practical, political content. The class-ridden partiality of these institutions in the capitalist state is expressed in the finely-manicured hegemony of capital. Through identification and structural appropriation of these concepts and their empirical correspondence in society, we discover not universality of access to justice, equality or freedom through institutions such as the public media, curricula or labour markets but the mass participation in practices that reproduce suffering, political stupidity and pseudo fulfillment of needs through consumption neuroses.

A praxiology that relies for one of its moments on immanent criticism needs theory that recognizes the social world in tendential movement. It does this by taking target concepts of the problem under study, examines their logical structure, appraising the relations and their outcomes

Concurrently it examines the object-as-institution or as-practice in its implications. Through internal criticism the practical method deduces the political-epistemic connections between words and objects/institutions constructing a portrait of the internal contradictions and limits of this relation - in its own terms. A similar propaedeutic occurs with Marx in his analysis of essence and appearance in capitalist commodity relations. Immanent criticism can demystify the taken-for-granted image of a social object, I could say a new social studies program or the in-service approaches used in its introduction, by its internal dissection into a set of revealed political-cultural relations. The object emerges in relief while the contradictions between those practices reveal the split with the conceptual practices that advance the object in routine formal or informal life. The conceptual practices themselves are shown as contradictory in their partiality in portraying the social object. Immanent criticism can yield to practitioners the rhetorical nature, limitations of its language practices or of their essential misidentity and difference with objects in question. Ideological de-mystification of cultural and linguistic practices opens reform efforts to a possibility of radicalization. A propos, here, is the 'ruddy-cheeked' language of curriculum innovation and evaluation projects that offer extended claims to the possibilities for unlimited happiness and wisdom of their program planning. Negation as a methodological device works here to question prima

facie the word-deed relation of specific, organized social settings. In anticipation of Adorno's further elaboration, negation indicates the limits of sets of symbolic resources locked within the present social order but equally reveals the converse of symbolic-practical possibilities within present or unrealized alternative social formations.

Philosophy (negation) rejects the veneration of the finite, not only of crude political or economic idols, such as the nation, the leader, success, or money, but also of ethical or esthetic values, such as personality, happiness, beauty, or even liberty, so far as they pretend to be independent ultimates ... basic cultural ideas have truth values, and philosophy should measure them against the social background from which they emanate. It opposes the breach between ideas and reality.

(Negation) confronts the existent, in its historical context, with the claim of its conceptual principles, in order to criticize the relation between the two and thus transcend them. (Negation) derives its positive character precisely from the interplay of these two negative

(Horkheimer, 1974, p. 199)

Immanent criticism in the service of the practical method criticizes cultural forms, discloses hitherto relations, reconnecting them in our awareness to the social totality. By revealing the connectedness of 'fixed' institutions to their historical ensemble, we can see how class relations and class knowledge can limit or sponsor change. In this way immanent criticism is a moment that sponsors a change in practice as well as a moment that shares with it.

Of particular import for understanding curriculum reform is the extent to which its language or constructs are ideological. That is, do the practical language or program orientations, for instance, represent teaching and learning situations as harmonious rather than the possibility of their being conflict-ridden; do program rationales assume uniformity in instructional objectives, that technicization of evaluation protocols promote the general interests and social learning styles of all children regardless of background rather than the political sponsorship of particular class and ethnicity of children? We can consider that immanent criticism can reveal ideological practices, then, that are materially real in their effects as they channel interpretation and action in social life to particular directions. Ideological practices, as cultural practice, can cause social relations to take on a reified, nature-like quality in the minds of participants thus accenting particular "modes of existence." Each project, in curriculum study, sponsoring these questions will use different protocols yet each is committed to dwelling in the tension between the performance of reality and its formal 'competence.' This tension is sustained by particular social relations that are, in principle, empirically knowable.

For instance,

... subjected to such an analysis, the social agencies most representative of the present pattern of society will disclose a pervasive discrepancy between what they actually are and the values they accept. To take an example, the

media of public communication, radio, press and film, constantly profess their adherence to the individual's ultimate value and his inalienable freedom, but they operate in such a way that they tend to forswear such values by fettering the individuals to prescribed attitudes, thoughts and buying habits. The ambivalent relation between prevailing value and the social context forces the categories of social theory to become critical... (reflecting) the actual rift between the social reality and the values it posits.

(Horkheimer, (1941) quoted in Held, 1980, p. 187)

Here then is an instance of the kinds of questions, immanent criticism promotes through a praxiology. Although only one moment in the practical method, it is both normative and descriptive work.

2. What then is the situation of knowledge appropriated by the activities of immanent criticism. Horkheimer, as have indeed all the members of the Institute of Social Research, insisted the critical was to be open and in sympathetic coincidence to the advanced thought forms of the global intellectual critique, through philosophy, was to ally itself whenever conceptual bridges permitted with the progressive advances in social empirical analyses, social psychology, economics, literary criticism and so on. This meant as well that the moment of criticism would draw from and incorporate traditional theory as well as the progressive 'critical' forms of radical, alienated groups. This occurred in

Marx's work particularly on political economy, its criticism and supersession. What this suggests is that traditional theory contains points of view that, in situ historically, had their 'moment of truth' and must be incorporated into the progressive formulations of the present nexus of social relations. Hence battling with positivist apologists, as we are so wont to do in contemporary social theory, has its value as a tactic only so that attention is drawn to the partiality of traditional positions, the fact that they are rooted historically, yet generalized politically and ideologically and this to be transcended in a new totalization of society and in new method. Often conventional criteria of methodical adequacy, and systematic reflection is preserved when working in the methodological categories of traditional social science. Horkheimer saw the schism between social science and critical theory as one wherein the inert facts of traditional science were presented generationally to students or to other scholars so this knowledge was merely diffused or transmitted to larger circles of believers. Research then constitutes naming and diffusing facts. Critical theory, instead appropriates the facts of empirical inquiry and re-presents in research and in pedagogy their connective relations to a past social formation. It uses conventional research outcomes as part of the material for understanding segments of socio-historical reality. But it also integrates those

'facts' into a research program of a higher level of complexity - contextualizing or re-contextualizing facts, concepts, principles from its own progressive method as well as the residues of earlier intellectual work.

The research practices become a re-totalization in interdisciplinary terms that incorporates the old and the new concepts secured by a sense of the problem under study in its particular and universal aspects. This representation of the diachronic and synchronic aspects of social phenomenal analysis had not occurred in any systematic inquiry prior to Marx's work on alienation and capitalist production. The search for transcultural principles of human universals is conducted alongside the immediacy of social life. As a result what evolves is not merely a more totalized understanding of social and cultural phenomena, previously partialized, but a re-conceptualization of conceptual structures, methods of procedure, and the unlettering of societal tendencies held in check. As the different mediations of a social phenomenon are revealed one sees a kind of historical accounting so that new possibilities of learning, man's nature, lifestyle, societal organization and research practices emerge. As the bases of social learning shift, our understanding shifts from the immediate to the universal global experiences and back again. Immanent criticism as a moment of practical method allows inquirers and citizens to inhabit that tension between the results of

other persons' labour as history, and the possibilities of a future in the critical appropriation of the present (see Johns, 1978).⁷

In the more recent literature of curriculum research, much attention is given to re-attaching theory, development, and evaluation to the concrete human practices that sustain them. To do 'deep' program evaluation can mean to practice an immanent criticism of say, school members' language and work, program outcomes and the latent significance for social mobility or professional autonomy et cetera. Taking the presentations of members, investigating the gap between rhetoric and performance, and then resituating these performances in a large social and professional context constitutes a structural withstanding of selected innovations in schools. Consciousness-raising is a potential outcome of a research theory of practical method. Under the democratic organization of evaluation procedure and dissemination, participants can develop those horizontal shifts of consciousness into the logic of their pedagogy - something traditional vocabularies have not promoted. To the degree that consciousness shifts of particular types amongst school and curriculum people is 'successful' (that is, empirically correct, mobilizing, forging the sense of particular-universal dialectic), then the conceptualization of progressive educational acts will be seen as both possible and necessary.

What is underdeveloped, so far, in my discussion of Horkheimer's contributions to practical method is the praxical

or power to act that can infuse immanent criticism with life. I will refer to the problem of action repeatedly in this chapter as method and throughout the study. This is the most chronic blockage that faces curriculum reform today on three counts: failure to act reflectively, failure to know when one is acting progressively, and failure to overturn the illusion that one is acting at all. It should be noted that I refer to progressive or promotive action - action that advances a generalized interest of all participants in a definite social formation. This of course has to be specified with each curriculum project. (Traditional theory is a practice of sorts since as an activity conceptually, and technologically it sustains redundant conceptions and outcomes in social life.) The works of Horkheimer, Adorno, Habermas, with whom I build this text, invite members to take up criticism, negation, and discourse as forms of progressive, theoretic practice that restructure the illusions of the epoch leading to a necessity to act generally and historically. This is not beyond the interests of curriculum workers but integral to their projects for the good life.

Horkheimer realizes that a position on practical mobilization of persons must accompany theory that critically restructures itself. He notes via Marx, Lukács and Gramsci that any philosophy of praxis entails the verification of theory in real persons' concrete projects or praxis. He recognizes that despite the pessimism of the 1930's in Europe, equally so under current organized capitalism, that theory

and practice must be consciously united to change 'reality' and to change consciousness. A propos Hegel to see the subject appropriate reason differently is necessary but insufficient since 'reality must be changed so it no longer distorts consciousness'. Understanding curriculum change, and its determinations, need not alter the alienating social structures in which it is embedded. Practical material action must achieve the result of consciousness and reality shifts so that a continual restructuring and humanization of the general and the particular is achieved. Practice for Horkheimer, is a political, epistemic, and historical category underwritten by the organization of collective energy.

The verification and confirmation of ideas, which relate to men and society, does not consist in laboratory experiments or in the search for documents, but in historical struggles, in which conviction itself plays an essential role. The false view that the present is ... harmonious, forms a moment in the renewal of disharmony and downfall ... itself becoming a factor in its own practical refutation. The correct theory of the prevailing circumstances, the teaching of the deepening of the crisis and of the imminence of catastrophes are, to be sure, constantly confirmed in full detail, but the picture of a better order which is inherent in it and by means of which to claim for the evil of the present is oriented - the immanent representation of mankind and its possibilities - is determined, corrected and confirmed in the cause of historical struggles.

(Horkheimer, quoted in Held, 1980
p. 192)

What about the organization of participation of Who is to

become theoretically and practically mobilized for projects in the general interest? Horkheimer suggests that theoretic criticism and the practical projects that accompany it, in a society of chronic differentiation, often fall to the hands of "progressive social forces" that are small, isolated and marginal. This is likely to be a practice short on participants but necessarily conducted in the general interest for emancipation that anticipates later popular participation. Because of the relative isolation of the reconceptualist community in curriculum theory it finds itself in such a strategic yet marginal niche. The 'correctness' of its theory, of its curriculum projects, as generalizable interest, is only vindicated in the steps all participants take toward political and professional autonomy.

As the new needs of character, intimacy and social interests of persons are fulfilled in discourse and action organized in progressive collectives, rational forms of social learning become more plausible.

The awareness of the self as an autonomous individual with his own goal is giving way to the corporate mentality; I might almost say that the earlier self-awareness is now being unlearned. The phenomenon is not wholly negative in its implications. The movement away from the self-awareness of the ego to the self-awareness of the community, and the negation of the individual which is certainly part of modern life, do have as one element a turning from egoism and from self-love as such. The meaning of the whole process will depend on whether in a regulated world the ego will be

raised to a higher level or simply forgotten.

(Horkheimer, 1974, p. 157-8)

ADORNO'S CONTRIBUTION AS A MOMENT OF NEGATION

Theodore Adorno, another core member of the Institute for Social Research and who has now popularized what the Frankfurt School wrote in the period 1930-1969 in both Europe (including England) and the United States in the areas ranging from cultural sociology, epistemology, studies of contemporary consciousness, and the nature and role of philosophy in society. Adorno once suggested that his lifelong inquiries were primarily a means to get to know the norms of commonsense since they would provide a natural control over thinking that merely classified and registered mundane facts. Instead, to consider everyday facts as relations of 'infinite mediation' was the understanding through which commonsense could be transcended. The latter for Adorno, and for most of the Frankfurt theorists was an essential normative premise in their work in what could be called - their philosophical methodology of cultural analysis. Adorno in attempting to redeem the critical promise of philosophy in society since Kant sees

His essential effort is to illuminate the realm of facticity - without which there can be no true knowledge - with reflections of a different type, one which diverges radically from the generally accepted canon of scientific validity.

(Adorno, 1981, p. 7)

In our context, in this study, we ought to be concerned with the complementarity that exists between the work of Horkheimer and of Adorno. As each other's thought matured in the 1930's and 1940's and their respective statures became independent of the Institute, we can see divergences within their general concern with the redemptive power of philosophy in social reconstruction. In many respects, Horkheimer, through his writings on the methodological differences between traditional theory and critical theory, the symptomatic spread of instrumental reason, and the functional relations between forms of social science and state or bureaucratic authoritarianism in the advanced societies of the West, have not served to oppose him in intellectual interests to Adorno. Instead, like a prism, the social totality as the constitutive object of both their analyses captures and refracts many dimensions of structure, culture and consciousness that both men helped to illuminate.

Adorno, among his arrays of interests within a neo-Marxist tradition of discourse that included Lukács, Korsch, Gramsci, Benjamin, and others in the period 1920-1940, was particularly concerned with how forms of knowledge caught and reflected the nature of society within their methods and objects of analysis. That is, not how did social problems or value conflicts become topics of study in a research agenda in human or natural science, but how did the dominant relations of the social totality express themselves

procedurally and substantively in what becomes philosophy for the age? In other words, how is it that in the reading and practice of a liberal economics text such as Samuelson and Scott's Economics - Canadian edition (1968) by students and researchers are the social forms of an organized way of life reproduced - again, not as self-evident topics of Canadian economic life such as regional disparity, or fiscal transfers, or the theory of secular inflation but how it is that these become constituted as problems, at all, and that we act intellectually on them and materially through them in a certain way? Clearly, the implications of this interest of Adorno's for curriculum research are enormous - or for what some have called a sociology of educational knowledge. (Young and Whitty, 1977; Gramsci, 1971). I rephrase one point of Adorno's interest for us to be how the mode of productive organization and dominant opportunities for cultural practice are embedded as truth statements in protocols of curricular knowledge. To learn more about how the society is constituted and the nature of its impingement on our consciousness means, in part, to examine the internal structures of curriculum protocols and rationales as a particular kind of dialectical criticism. This suggests that Adorno's interest in renewing philosophy as criticism through dialectical negation is a way of revealing the material force of cultural meanings and their roles in social resistance, change, and reproduction. The origins and forms of this philosophy of cultural criticism can be seen in works such as Prisms (1967),

Negative Dialectics (1966) and the Authoritarian Personality (1950). As the imminent revolutionary transformation of society by the proletariat, and the challenge of progressive social science to state orthodoxy did not materialize, members of the Frankfurt Institute drew closer in their pessimism and community. An increasing focus on the problems and practice of human science research, and on the systematic deformations of cultural and intellectual awareness were self-conscious choices by Horkheimer and Adorno seeking to transcend an increasingly administered reality. Each, intellectually, complements the other in a subject-object dialectic between philosophy and society.

What is it about Adorno's mature views (1950-1970) that should interest us as an element of the practical method? In order to answer this it is necessary to present some of his first views for philosophy.

Adorno contends, as would Horkheimer, that the history of philosophy since Plato has been the history of underdevelopment in subject-object relations. That is, philosophy has either led to the atrophy of subject relations or object relations. Where it has made explicit the world constitutive role of each, it has paid inadequate attention to their interrelationships — as, in the career of praxis, for example. Hence we have a history of philosophies either concerned with a hyper-subjectivism or equally, with an all-reductionist objectivism. This study has made frequent reference to the methodological effects of either development in understanding

human practice. Typical forms of these philosophical exaggerations are idealism, platonism and select existential-phenomenologies or materialism, empiricism, and experimentalism in research - each form expressive of specific periodized economic organization and ideological necessities. The Frankfurt group in lineage as a neo or post-Marxist tradition, dealt severely with the omissions of vulgar 'Marxist' materialism as a whole. It is the work of Adorno, Benjamin and Horkheimer that deals integrally with the presence of idealist thinking in research practice and in the popular consciousness of the Western societies in their politics, economics and culture.

Adorno is concerned to show idealism in bourgeois societies as a form of identity thinking. Identity, endemically used is the mode of subsuming theoretic and concrete or practical objects under unitary concepts of self-sufficient rational systems. That is, an action, or attitude or practice as an object of interest is assigned unambiguously under a general schema or plan. This kind of thinking prevalent, in western societies, is found as the dominant cognitive-practical mode of organizing corporate life, social policy, intellectual labour, cultural practices, and common-sense understanding. Adorno argues that this kind of identity thinking as an idealist or materialist hypertrophy results in the maintenance of ideological relations in that the conditions of dependency are named but are not historically affirmed. Such thinking is typified, I suspect, by the ideal

type methodology of Max Weber wherein particular cases are subsumed under the sense of the empirical universal. The particular case, in question, is seen as self-sufficiently explained with this procedure. No mutual address of the grounds or origins of the particular are possible once subsumed under categorial universal - whether of social science or of physics, say. Despite the problems of conceptual contradiction with such reductionist sciences, the further import of such thinking is the severance of any critical questions that address the social existence of the object, in question. In such situations a wild sociological relativism has often emerged in an area of inquiry - with the absence of any grounds that could judge the 'power' or 'truth' of competing explanations. Adorno is concerned, then, that there be a standpoint upon which to press the worth of social science research for its qualities of self-renewal and initiation of progressive humanization of group life. Interestingly enough, the grounds of this transcendent renewal for Adorno are found through the understanding of the mundane life practices of individuals and collectivities. It is from within the 'things' themselves, from the subtle unfolding of interdependencies of subject and object that his analysis is centred - as a form of internal criticism of concept and of object. As a weapon of ideological criticism Adorno continually seeks to show how non-sequiturs, illicit contradictions, one-sided arguments, reductionism, glib subsumptions in the materiality of thought essentially express

the structure of society. It is common of identity thinking to confuse the desirability and possibility of single standpoints that conceive and subsume development under an objectivist category. Such thinking, as was the paradigm case for curriculum theory prior to 1971, has its practitioners operating in theoretic self-sufficiency forgetful of the historical circumstances under which their theorising is a reproductive labour. Theory or thought is always a form of praxis, historically situated dependent on physical labour to reproduce the object world as the latter depends upon the distribution of meaning in social forms for its representation or reality, accent of the world. This position realizes that both subject and object relations cannot be dissolved practically or intellectually. Theoretical revolutions or embodied criticism has an obligation recognize the grounds of its object world and hence its limits. Philosophy for Adorno cannot embody, or lead structural transformation but can establish pre-conditions and a reflective remembrance throughout the struggle.

David Held suggests some of the formative influences upon Adorno:

... first his acceptance of aspects of Marx's critique of Hegel's notion of history; second his concern with Benjamin's criticism of conceptual thinking, Benjamin's stress on the impossibility of universal history, the importance of the particular and the difficulties of comprehending it; third, his adherence to Nietzsche's views on the absence of ultimate foundations

in epistemology, the falsity of identity thinking and the importance of method and style.

(Held, 1980, p. 203)

This patchwork of influences gives Adorno's work a contradictory but powerful quality for showing the complexity of social life at the levels of everyday consciousness and of structure. It was important for Adorno, as it was for Hegel, to account for the formative conditions of particular and typified consciousness in societal culture.

If we examine the history of typified or periodized consciousness in society, diachronically, we discover the passage of different conceptual systems served, usually tacitly, an interest in control through class rule. The Hobbesian sense of disorder in the polity became of increasing concern to a bourgeoisie that became ascendant through violence and revolutionary science. The interest in control of economic production, of social planning and of cultural practices has become a chronic pre-occupation with capitalist societies and the organization of a world economy. With the risk of sounding too-Orwellian, philosophy is the organization of social science, and by implication, school knowledge is effective as a system of control from without, structurally, in the materialization of meaning and representation, and internally through consciousness. The question which pre-occupies Adorno and to a lesser extent, Horkheimer, is the 'congruence' between conceptual systems and empirical phenomena; that is, between the concept and the object or subject.

and object adequacy. If grand systems theory, for instance, claims to represent through its totalization the sum of cosmic relations, its vulnerability lies in its brittle rejection of alternative premises and scaffolding that claimed even marginal non-identity with empirical conditions. It is the mind set and flawless assumptions of exclusive conceptual mastery characterized by systems theory or by ordinary-language philosophy that invite investigation by Adorno and the critical theorist. Each of us as investigators is encouraged by Adorno's precedent to look at the particular empirical elements or objects whether they be ideas, text, action, artifacts or relations first of all as non-conceptual objects and then as sets of subject-object relations. It is this tension between the category or concept and the thing names, with its place in specific historical relations that characterizes non-identity thinking. For instance, in Dewey's pedagogy the concepts of interest or discovery, or autonomy, or progressive organization embody a set of subject relations which in turn pre-suppose a set of object relations each of which in turn mutually determine one another theoretically, practically, and pedagogically. Each set of relations, in turn, limits and promotes possibilities of consciousness, of deep understanding, and what is taken to be pedagogy, within the school and in the wider community. Each can support critical analyses of its practices and of the mediations of one with another in conceptual, political, and professional contexts. I could proceed, for example, with a

project that examined the conceptual underpinnings of the idea of interest and perform internal criticism. Equally, I could see how the claims of this concept 'squared' with the practice or object relations that intertwine with the interest idea in the classroom, or in the community. Does the concept "interest" connote more or less than the field of its object relations - what qualities does the conceptual field express or illuminate - does not the nature of the object remain unexhausted by the intellectual structures that claim to predicate it practically and theoretically? Further, what about the historically - situated interdependencies that pertain between the Deweyan notion of interest and its pedagogical practice? That is, how do teachers' consciousness and professional 'vocabularies of motive' mediate the intellectual system with the practical choices of their work - in the ongoing process of materializing curriculum? These types of questions and others dealing with formal educational system conceptions, their commitment to sustain 'equality of opportunity', for example, inside school programs and outside in occupational access and civic participation, can each sponsor analyses of 'factitiously real' practices whether of concept or object, subject or object. Non-identity thinking for Adorno means beginning the material, heartless, task of demolishing the arrogance and mistrusts of established intellectual practice and its role in the embodiment of evil in society. We may note:

...Auschwitz demonstrated irrefutably that culture has failed....That this could happen in the midst of the traditions of philosophy, art, and of the enlightening sciences (sociology, education) says more than that these traditions and their spirit lacked the power to take hold of men and work a change in them. There is untruth in those fields themselves, in the autarky that is emphatically claimed for them. All post-Auschwitz culture, including its urgent critique is garbage. In restoring itself after the things that happened without resistance in its own countryside, culture has turned entirely into the ideology it had been potentially - had been ever since it presumed, in opposition to material existence, to inspire that existence with the light denied it by the separation of the mind from manual labor. Whoever pleads for the maintenance of this radically culpable and shabby culture becomes its accomplice, while the man who says NO to culture is directly furthering the barbarism which our culture showed itself to be.

(Adorno, 1973, p. 367)

CHARACTERISTICS OF THE NEGATIVE DIALECTIC IN ADORNO

1. One of the legacies of Nietzsche's influence upon Adorno has to do with the importance the latter placed on the form-content relations or style of his written texts. Adorno felt it necessary that not only his topical content but the structure of its form be crafted in such a way as to reflect everyday and intellectual life in the advanced societies. He was concerned through his writings to display the subtleties of inconsistency, and contradiction that plagued all rational conceptual

217

systems of our time. As the social structure influenced the possibilities of theoretic activity, and its conditions of labour, so too should thought through form and texture display something of the lived experiences of bureaucracy, capitalist production relations and the culture industries. To the extent that those object relations display hypertrophy, one-sidedness or repressive tolerance, so must the text show their non-identity with the concepts, or ideological representations that stand for them. Adorno is interested in not only mirroring the deformations or non-identity of subject-object relations in culture and society, but also in restoring a sense of particularity and 'at-homeness' to object life. In knowing society as a nexus of subject-object relations through the pre-dominance of object particularities means to know the social totality formatively and particularly; as it were in the minds of men. Given that the texture of everyday life for many persons is experienced as contradictory, mystifying, and incomplete in our understanding of it suggests that textual forms must display the relations similarly not as a descriptive act but as a generative-interpretive act. It is within the recognition that persons as readers experience in these texts that the possibilities exist for a provocative transcendence of the relations depicted and analysed.

Adorno's use of literary techniques, omission, irony, idiom, startling comments, vignettes, essays, formal theoretical argument and other devices are found across the range of his writing. Texts such as Minima Moralia (1974), Prisms (1967), Negative Dialectics (1966), Dialectic of Enlightenment (with Horkheimer, 1972) and Jargon of Authenticity (1973) and others display a wide range of arguments whose stylistic constructions in their often fragmentary incompleteness were designed to jar, and provoke readers into a remembrance of their social life experiences. Adorno attempts through these texts a provocation of critical thought in the community of readers. It is important to see how these characteristics of his critical analyses are not chosen for the purpose of mere titillating effect. Methodologically, the non-identity thinking of the texts serves Adorno's first premises of renewal in philosophy. The reader is intended to less introject and more actively reconstruct meanings and relations that occur cryptically in the text. The reader struggles to make sense of the evidence, allusions, and relations of a social object in the way of a literary 'praxis'. Methodologically, the reader seeks to dispense with the conventional, closed, totalized categories of earlier social science and popular wisdom as their incompleteness, and dependency-provoking functions are unearthed. It is essential, for Adorno, that his texts, others' critical philosophy challenge the insular self-sufficiency of earlier

scientific and popular discourse acting as the bulkheads of consciousness of an administered, reified society. The title Prisms suggests a multi-sided search and display of historical perspectives, often in conflict, can refract the deformities and possibilities of the social totality.

Clearly, then, Adorno's textural style is not meant to entertain the reader or community, first, but is a dimension of his critical methodology. He both provokes, and raises the reader in self-generative criticism at the same time as he provides social and philosophical relational theorizing. Chosen themes, as I mentioned in a prior section on Adorno, serve to give a normative and historical unity or transparency to these prismatic adventures of text. Form and content as methodical devices in their own right form part of a practical method for intellectuals in emigration.

The specific approach of *Minima Moralia*, the attempt to present aspects of our shared philosophy from the standpoint of subjective experience, necessitates that the parts do not altogether satisfy the demands of the philosophy of which they are nevertheless a part. The disconnected and non-binding character of the form, the renunciation of explicit theoretical cohesion, are meant as one expression of this. At the same time this ascesis should atone in some part for the injustice whereby one alone continued to perform the task that can only be accomplished by both, and that we do not forsake.

(Adorno, 1974, p. 18)

2. It was both Adorno's and Horkheimer's growing sense of pessimism about the possibilities of emancipation in a

technical-industrial culture that drew both of them to re-focus their inquiries to research practice, to the methodological and to the particulars of the mundane consciousness. Hope had faded for proletarian revolution and the promise of a public challenge through progressive social change had never materialized. As I have argued, the influences of Hegel, Nietzsche, and Kant can be seen to express themselves differently as objective conditions changed and his pessimism deepened. The idea of the transcendent, as something beyond concept and cognition, has also occupied a part of the political-culture vision of the Frankfurt school. Adorno, in particular, can be seen to couple this interest with his methodology of subject-object relations. He comprehends the possibility that the concept, as in utopian thinking, extends beyond mere empirical referents as in the organization of civic culture. It can point to conditions imaginable but not yet realized and use the transcendent moment as a lever of hope for those persons who can begin, through discourses, to identify common human interests. Adorno retreats then to the idea of the question, not as a point of political or intellectual escape but as a refuge within which to reflect and inquire in anticipation. Joining in the symbolic violence of the dominant order is always laden with risks that threaten to dull critical perceptions. Received thought, whether formal or commonsense, must be subjected to a

critical dissolution as a way of breaking its hold on the minds, imagination and activity of persons in concert. Curriculum planning is a case in point where the naming of the world is generally grounded in closed, ahistorical conceptual systems that prevent the discussion or imagination of origins, or of changes in our naming protocols. Dependency in consciousness and sclerosis in practice occur as the object relations are prevented through symbolic manoeuvres that convey the object relations of social historical world as fixed, atomized, calculable objects. The necessity of social life is the constellation of object relations and subject-object constitutive relations that must be made transparent and intimate to participants. I do not suggest that persons in the community begin to master first premises of philosophy but that responsibility for civic cultural forms, their production and distribution, be made the political property of all citizens. What Adorno seeks through the negative dialectic is an openness to critical junctures in personal or collective movements and that a practical vigilance be maintained through one's writing, one's inquiries and remembrances, and presumably through chosen ways of living. For instance,

As the thinker immerses himself in what faces him to begin with, in the concept, and as he perceives its immanently autonomous character, he clings to the

idea of something beyond contradiction. The antithesis of thought to whatever is heterogenous to thought is reproduced in thought itself, as its immanent contradiction. Reciprocal criticism of the universal and of the particular; identifying acts of judgment whether the concept does justice to what it covers, and whether the particular fulfills its concept - these constitute the medium of thinking about the non-identity of particular and concept.

(Adorno, 1973, p. 146)

Is there a way of proceeding methodically, once more, in our projects that would instance our work as a dialectic of negation? Adorno has argued that in order to understand a social object, it requires that we recognize its historic positional value, or context, and its constellation of relations with other objects within and without its institutional universe. To know an object means to work out the 'inner history' of that object that has been constituted. Through its social-political mediations so we are able to some degree prefigure its transcendent potential and its limitations for us in our projects. We can see that if the social objects were re-conceived and re-experienced, it may become a motive and action-forming source. In order to unlock the weight of tradition around us that saturates our lives, our concepts, and our visions so that it works for us as a history of and for humanity, Adorno employs negation or non-identity thinking. This becomes a means of exploding convention as a coercive, non-progressive form. In our case, with the later Adorno, we are particularly concerned with

textual negation. As I have argued, this kind of analytic-theoretic practice serves to wedge a gap between the supposed correspondence or concept-object, appearance-essence, if you will, that identity thinking assumes. Using negation, a means of exploiting the inner tension or energy between the traditions of naming and the actual historical practice, the theorist explores the unredeemed norms that the object construes or carries immanently. By freeing the object from being caught in an historical redundancy, its possibilities as grounded alternatives in a constellation of multi-textured relations in the world become accessible to persons. The project of inquiry under non-identity thinking involves as analytical-empirical exploration, then, of this gap or tension between concept and object - a tension or contradiction that identity thinking glosses over. The exceptional importance of language use and evocation is necessarily underscored with negative dialectics. Two items that become central to this kind of analysis are possibility and object. They acquire, as do others, a methodological status as procedures that reveal for and empower participants in the practical method. As Adorno says,

We can see through the identity principle, but we cannot think without identifying. Any definition is identification.... Non-identity is the secret telos of identification. It is the part that can be salvaged; the mistake in traditional thinking is that identity is taken for the goal. The force that shatters the appearance of identity is the force of thinking; the use of "it is" undermines the form of that appearance, which remains inalienable just the same...

(Adorno, 1973, p. 149)

The notion of rational identity is a methodological and normative standard that Adorno considered to reside in unredeemed objects. Rational identity is an organizational ideal, that can emerge, but conventional thought has failed to perceive. The typical charge of this kind of thinking is that utopian elements are abstractions of the object, in question whereas non-identity thinking reveals the utopian projections as but aspects unseen or suppressed by linear, conventional thought. Another approach is to start out from the concept, as Adorno indicates at one point in Negative Dialectics, so that an interpretive and evaluative rendering can be made of the object. In a discussion of the equivalence of exchange principle or the bourgeois free market ideology

The barter principle, the reduction of human labour to the abstract universal concept of average working hours, is fundamentally akin to the principle of identification. ... Once critical theory has shown it up for what it is - an exchange of things that are equal and yet unequal - our critique of the inequality within equality aims at equality too. ... If no man had part of his labor withheld from him any more, rational identity would be a fact, and society would have transcended the identifying mode of thinking.

(Adorno, 1973, p. 146, 147)

I refer, as well, to another example of Adorno's use of negative dialectic in connection with the concept of freedom. Here what he seeks to display in his section on method is the concept - object rift that pertains to freedom under current bourgeois hegemony. Adorno does not merely state an incongruence between the two object fields, in the sense of a

logical non-sequitur, but traces the organization symbolic expression or naming of freedom to the (unequal) power relations of a late capitalist society; that is to the reproductive sites of naming practices. He is then able to couple this part of the dialectic to an empirical analysis or survey of what conditions obtain for men and women civically and economically in our society. By then bringing the two parts of his analyses, subject relations and object relations together, he partially completes the dialectic of negation. He thereby enables participants to see the historical interdependencies of subject and object - out of which practical activity may be organized. Depending upon circumstances a project of practical social inquiry informed by a negative dialectic can begin on a subjective or objective moment. Each, however, must recover the other. I would like to illustrate this approach further by citing Adorno's discussion of freedom. (It should be remembered that he talks not of abstract notions of freedom but of something that we as persons living now, in our industrial culture, invest in and expect from, concretely).

The concept (freedom) says not only that it is applicable to all individuals defined as free; it feeds on the idea of a condition in which individuals would have qualities not to be ascribed to anyone here and now.... The concept of freedom lags behind itself as soon as we apply it empirically. It is not what it says, then. But because it must always be also the concept of what it conceals, it is to be confronted with

what it covers. Such confrontation forces it to contradict itself.... The individual is both more and less than his general definition...this day, he will experience this "more" as his own negativity.... The potential of freedom calls for criticizing what an inevitable formalization has made of the potential.

(Adorno, 1973, p. 151)

3. Because socio-cultural and philosophical inquiry can begin, for Adorno, on different fronts, even though subjectivity or objectivity cannot be known as a pure datum, certain methodological concepts have a general significance in negative dialectics. These are useful ways of determining the particular (i.e., unique historical character) of a concept or object and help trace the internal subject-object relations of a social or physical phenomenon. It is important to convey this dynamic between subject and object, not only for the critical theorist, but for the wider participants in certain cultural practices for this theoretic work shows the 'push and pull' of creative-regressive relations lying behind the particular character of the object in our society, in our subculture and, in our school or program or scientific tradition. To begin to know how and what to resist means to recognize what determining marks the society we reproduce for, makes upon the object of our interest. I am speaking here about the everyday appearance that say, 'freedom', or 'individualization', or 'competency based teaching',

or 'formative evaluation' or 'affirmative action' have for us routinely coping in our society and institutions at their stage of productive development. This is another way of saying that although objects are not known directly, they have primacy as an ontological field for Adorno, and for critical theory. Methodologically, as questioning persons we approach the object field from within ourselves - seeing each pole as points of energy. Yet, the recognition that needs to be re-achieved continually is that our reciprocal constitution is a reflective-formative process irreducible to mechanical or subjective centres.⁹ Each shift in the history of social science methodology has tended to leave one or the other relational field obscured.

Other methodological concepts which need mention as composites of an approach in negative dialectics are those of constellation, essence-appearance, particular-universal, and synthesis. I have treated some of these obliquely in the earlier discussion and examples.

Constellation(s), suggests Adorno, is a means of "illuminating the specific side of the object, the side which to a classifying procedure is either a matter of indifference or a burden" (Adorno, 1974, p. 162). The analogue for this kind of thinking is that of language conduct. It is suggested that language is so much more than a sign referent for its concepts and their objects.

Its primary function in appropriating the world is not by naming it but by revealing concepts, centred around an object through a relational network impregnated with intention. In coming to know the object field, the constellation connotes and evokes far more than the concept in its bold singularity can possibly indicate. Concepts that may subsume, or pretend, or correspond, 'excise' far more practically than they achieve politically through a spurious clarity. Adorno cites Max Weber's sensitivity to the difficulty of defining historical concepts. In attempting to compose a scientific practice adequate to historical sociology Weber illuminates his concept of capitalism relationally. Profit-motives are seen as emergent 'principles of lucrativity' and market relations. The axis of the latter is 'capital and interest calculation'. This is generated through the exchange, freely, of work-centred wage labour. This organization of production requires a 'rationalistic legal system' to account for cost, price, work flow, not to mention the separation of responsibilities "...and a pervasive governing principle of rationality at large" and so on. Nothing less than this kind of treatment restores the object field, capitalism in this instance, to its particular identity within history. It, too, can become the social totality to the particularity of other objects.

The paired ideas of essence and appearance have played strong methodological roles in the work of Marx, Hegel, Lukács and others in their investigations of capitalist

social relations and of the contemporary consciousness of those relations. Adorno incorporates this paired idea within negative dialectics as part of a methodical arsenal for determining instrumentalist practices and for disclosing progressive states of rational identity that lie within the objects. Adorno argues that essence is not the rather more Hegelian notion of a "hypostatized, spiritual being-in-itself." It is rather that which is undisclosed behind a "facade of immediacy." Although it constitutes what the facts are, their roots in an essential constellation of categories are denied or obscured by contemporary scientific practice. Factual representations in both our formal and popular thinking as intentioned projects help recede the essential into a 'background' world. Essence is the *bête noire* of a social life set up to reduce men to the anaesthetized routines of their existence. Appearance, then, is a way of describing the subject-objects relations of a "world that curtails and threatens their life by reproducing it and making them believe that it has this character so as to satisfy their needs" (Adorno, p. 167). Like the larger method of non-identity thinking essence - appearance posits the contradiction between the 'way things are and the way they purport to be.' Above all the hostile primacy of an object world is what confronts and stands over against men. Marx's analysis of capitalist society, is among other things a macrosociology, is paradigmatic of work that

unveils the fundamental relations of this society and shows how facts, or appearances are a material part of our totalized relations. Even as ideological representations they partially determine social and economic production but they also actively "deceive us" about the laws of society. As Adorno says,

Essence (in our society) is what must be covered up, according to the mischief-making law of unessentiality; to deny that there is an essence means to side with appearance, with the total ideology which existence has become.
(Adorno, 1973, p. 169)

What this study has pointed to in the context of curriculum reform, is reflected in the essence-appearance idea on several levels. Substantively, we have much difficulty in recognizing what curriculum development work actually is progressive, reformist, or reactionary. We have difficulty separating out, as practitioners, what it means to appropriate a theoretic tradition, critically, and commit ourselves to the practical transformations that follow its use. It is not only in worlds of research discourse that 'the levelling of essence and appearance' is felt. Adorno contends that subjectivity within persons is arrested. The knower as an emotive being has a reduced capacity to feel suffering and happiness, to 'separate essentials and in-essentials', and 'to know cause and effect.' It is not that the universal sense of essence is lost but that it is covered over in a hypertrophy of ungrounded cultural and political

practices. Criticism of the sort being assembled here can begin to denude the prevailing generalities of the social world as somehow necessary appearances in a natural order.

In subject-object relations, that is in critical practical inquiry, we see a tendency amongst theorists to conflate each pole to basic equivalence of one another - a pointing to 'in-here' and to 'out there' at the expense of each others' qualitative differences. Particular or particularity as part of the object pair particular-universal is a methodological concept that is used throughout Adorno's work to sustain a knowledge of social and cultural objects. He argues that to use the concept of the particular in pointing to objects necessarily means its negation at the same time.

It narrows the presence of the vivid object and what in fact lies, nameless and looming behind the object. This negation is a limited but necessary moment of negative dialectics. We live through and convene constellations of particulars in our lives. Yet we know more than we can name since "the particular would not be definable without the universal that identifies it, according to current logic; but neither is it identical with the universal" (Adorno, 1973, p. 173). In order to understand and act within society means to favor it from inside formatively - as within the particulars of consciousness and the symbolic practices (curriculum) of a particular social formation (society). Thus to participate creatively in society means to know, if not dwell, on its

social forms and cultural practices. For Adorno identity thinking, as thought reified, means the inability to dissolve the opacity of appearances in capitalist society to see how, for instance, equivalence exchange as a distributed meaning is examined, in itself as a symbolic form, and to what it, among other social forms, opaquely about the relational dynamics underlying this society.

But what about the converse of identity thinking? Is there not a promise that arises out of the workings of the negative dialectic? In order to convene critique, or a discussion of essence and appearance, or the particular and universal means we suppose or know of the possibility or presence of another realm of relations where emancipatory interests can be achieved. Adorno argues that the methodological concept, rational identity, preserves a 'true consciousness' or 'objective reason' over against ideology, false consciousness, appearance, or identity thinking. This supposes that the subject-object suppression, at formal and popular levels of our society, masks the idea of the object as containing ideal properties unrealized and unthematized. The concept for the object contains utopian relations that under different social relations could be met by the object in question. In social inquiry the questions of validity and origins of our knowledge, or truth, accompany the organization of a rational society. Negative dialectics, then, is both a method and normative materialization - up to this

point still unfulfilled. It inserts itself self-consciously and methodically in thought and in physical material reality and recognizes each as contradictory. Yet, these contradictions are particulars (capitalist commodity society) which are dialectical relations in their own right. Inquiry begins with these points. No interpretation of these contradictions is exhaustive. Negation seeks their transcendence through the force of its practical questions.

Society, if it is understood as the functional context of human self-preservation, 'means' this: namely, that it aims objectively at a reproduction of its life which is consonant with the state of its powers.... As soon as it were no longer retarded by societal or scientific authoritative orders, the subjective reason of the ends-means relation would be transformed into objective reason, which is contained in the axiological moment as a moment of knowledge itself. Value and value freedom are mediated dialectically through one another. No knowledge orientated towards the mediated essence of society would be true if it desired a different state of affairs. To this extent, it would be an 'evaluative' knowledge. Nothing can be demanded of society which does not emerge from the relationship between the concept and the empirical, which is not therefore essentially knowledge.

(Adorno, 1976, p. 62, 63)

The practical method that I develop through this study tries to unite the fragments of inquiry, into curriculum reform, from several different fronts. I am concerned that the notion of rational identity is brought a bit closer to us, as a community of readers doing curriculum work. Different

aspects of the study methodically emphasize and recover the subject and object relations of practices in curriculum reform in a way reminiscent of Adorno's critical philosophy. In itself, as a study, it is necessarily incomplete and fragmentary.

HABERMAS' CONTRIBUTION AS A MOMENT OF PUBLIC DISCOURSE

As I approach this third moment of the practical method I want to remind the reader of what he and I have been embarking upon. The practical method that I construct here and reiterate throughout the study is operative on at least four levels. By combining immanent criticism, dialectical negation, and public discourse I assemble firstly a critical scientific theory for explaining the phenomena under study; namely, curriculum reform as a social political practice and its special case in social studies education in North America. Secondly, the practical method is to have been taken as a way of reaching this text as a research discourse in a reflexive manner such that the structure of its arguments, its conceptual-methodical features, its political prejudices and the life interests and lifestyle of this researcher are continually made problematic as these relations impinge upon others who practice human science and research in the progressive paradigm of curriculum studies (circa 1970-1982). Thirdly, the practical method is to be seen a form of ideological criticism, prima facie, in that it orients its analyses of curricular text, conventional pedagogical relations, bureaucratic educational

vocabulary and school-society-world relations against a normative background of the anticipatory good life - post-Marxist socialism. Fourthly, the practical method contributes to a movement in this transitional phase of neo-Marxist thought, to secure the conditions for the organization and embodiment of political discourse and action in public institutions such as schools and universities and in the community life of persons not formally studying problems of discursive will-formation in civic and educational participation. Each of these four functions of the practical method is emphasized at different points of this study. Elements of each can only mediate with one another in a research community that gives it a home. The authenticity of this community is at test in responding unequivocally to these four levels of my study. The test of the practical method, never unequivocal, resides in the discourse and action of participants who challenge and appropriate it as a tradition of political philosophy.

Jurgen Habermas, now the most prominent representative of the Frankfurt School, demonstrates through the range of his writings on social evolution, social science methodology, analyses of the state, language and moral development a concern with the idea of the public sphere. Habermas sees the public sphere, an ideal of civic participation developed from early bourgeois society, as a normative and organizational standard to assess everyday, political, and

intellectual life under organized capitalism. The public specifically refers to an arrangement of social life whereby citizens could assemble, discuss, and form opinion freely and robustly - concerning issues of social life.

It was seen as a means by an emergent, enfranchised mercantilist class to contain the influence and caprice of established authority traditionally emanating from state, court, or church. The bourgeoisie as a social class was interested to secure a political foothold in the civil life of society in order that their commercial - economic interests could thrive in a social and political climate unhindered by dogma or the weight of precedent. The free and full expression of articulate opinion, as organized through relations of formal democracy, became one means of securing cultural-political hegemony of an economically ascendant class. The procedures of free argument became the justifying force for legitimizing public opinion. Hence discussion in order to have warrant and significance in the society is to proceed by force of critical reason. The bourgeois ideal, although now recessive in its particular class connotations, of the discursive formation of will has become a cultural institution under liberal and organized capitalism of considerable ideological and political force. This sphere, as the idea of public opinion, has been considered historically to express the general interest. This belief has prevailed despite the observations that it is affluent 'well-connected' persons who carry, formulate, and

project authoritative opinion. The popular assumption, then in our society, is that certain classes of persons represent the 'reasoning public' by virtue of their capital and property.¹⁰

However, despite its historical career, it is important not to forget the rational, critical impulse that lies embedded within the idea of public opinion as a process of discursive will formation. The possibilities that lie with this social institution in contemporary technical-rational society have never been fully realized in either North America or Europe for civic or educational participation. It has been argued by Habermas (1975) and Offe (1972) that the potentiality of the public sphere as one organization of public discourse and action has lessened under 'progressive' epochs of capitalism. In the context of everyday relations in the advanced capitalist democracies, the public sphere as a critical and rational organization of opinion in civic practice has been distorted and shrunk to resemble 'media' and 'public relations' work. The possibility of the organization of discourse and action in the general interest in public life has correspondingly lessened. It has been noted (Habermas, 1975; Touraine, 1968; Bell, 1976) that relations between the state and civil life or society have become progressively more intertwined as the sector seeks to stabilize capital accumulation, investment crises, and popular anxiety through intervention in economic and social benefit decisions. Additionally, natural science

and its technological derivatives is now considered a productive factor in the economic subsystems of society - losing its formerly quasi-independent and critical position in socio-cultural life. These tendencies Habermas contends reduce the possibility of the popular organization of will and decisions over issues affecting public life.

As the social system restructures itself, the form of social integration and class-based social interest shift from an economic organization based upon equivalence exchange, at least ideologically, to one based on organized corporate-state sector concentration and 'securement' of markets, pricing and investment structures. As a result the nature of intervention in everyday economic life shifts, as do the expectational profiles of work. Legitimation becomes a problem of fixing 'mass loyalty' to a system that still organizes social production for private interest.

One gambit the state uses to secure the bases of legitimation and motivation of the remainder of citizens is the 'depoliticization of practical issues.' The social value of popular and educational knowledge is defrayed by its sublation to instrumental thinking and technical problem-solving. Organized capitalist societies seem to be drifting toward a 'negative utopia of technical control over history' (Habermas, 1975).

Such contradictions can no longer be designated accurately as antagonisms between classes, yet they can still be interpreted as results of the still dominant process of the private utilization of capital and of a specifically capitalist power structure.

(Offe quoted in Habermas, 1970, p. 108)

Class distinctions persist in the form of subcultural traditions and corresponding differences not only in the standard of living and life style but also in political attitude.

(Habermas, 1970, p. 109)

In his work on the social evolution of societies and consciousness, Habermas attempts to reconstruct Marx's own method and analysis of historical materialism (see Habermas, 1979, c. 4) to take account of the structural shifts in organized capitalism occurring in the late twentieth century—something Marx apparently did not foresee. The effects of these shifts upon the normative structures and ego development of persons living in these societies is the most current interest developed by Habermas (Habermas, 1981). For the purposes of this study, it is Habermas' recasting of earlier historical materialism from productive labour as practical activity to work and interaction (or language) as the twin reproductive interests of human social organization. Habermas argues that neither Marx nor contemporary social theorists effectively recognized work and interaction as the material-historical struggles that constitute the project of the social work and hence social evolution. Hence, a

humanized praxiology must concern itself, according to Habermas' criteria with not only productive, material transformation but also with transformations in institutional and identity structures. In a study, such as this one, concerned with curriculum reform, as a cultural practice, the particular organization of symbolic interaction, and of cultural tradition is of primary importance.

The practical method which assembled, here, contends to have the capacity to accomplish analytic, interpretive, and critical or enactive inquiry concurrently. I achieve this by thematizing a particular cultural object or practice, curriculum reform, and begin to reveal the social meaning and possibilities of this object, often hidden, through the three moments of practical method: In one important sense, although the practical method contends to be human science and critique concurrently, it does so or unfolds only through revolutionary practice - anything less suppresses its encoded possibilities as a human project. In order to unfold in the general interest, as it were, means that explanation, interpretation and critique must be situated in self-conscious public discourse. This can be equally materially momentous as revolutionary research discourse, paradigmatic of human science or it can also be the revolutionary organization of enlightenment in public communities, and in school-based instructional settings where issues and decisions of real general interest (see Goss, 1981) have emerged in the minds of affected citizens.

What becomes of concern for curriculum workers, organic intellectuals (see Gramsci, 1971, p. 6) and, ironically, social policy bureaucrats in the state sector is the nature of self-understanding of citizens under successive re-entrenchments of capitalism. That is, what outcomes for social learning are associated with structural economic shifts in mediation with dominant cultural forms that would be significantly different generationally for citizens' latent interests in practical action? As Habermas shows, in his reconstruction of social evolution shifts in productive forces at the societal level imply necessary shifts in social learning so that changes in work relations, for instance, either lead to incorporation within a docile population or so that the population acutely challenges the shifts in their macro social reality; that is, as the principles of social integration within a society shift so do its relations of moral order and consciousness (see Bernstein, 1971). Although underdeveloped by Marx, Habermas develops the realm of symbolic interaction on both subjective and intersubjective planes. Social learning incorporates relations of moral insight, imagination and practical knowledge within the communicative organization of action. Within the universe of social learning communicative action is a means society introjected whereby conflict, consensus, and action are regulated in the course of everyday life. Clearly, as the complexity of the economic subsystems, and with that new productive relations occurs the more mature

forms of social integration-develop. Using the notions of socialized labour and socialized consciousness in this context, it could be argued that more mature social learning could occur. Hence, the possibility of superior moral insight organized around language and interaction could be realized through crises events in organized capitalism. A central insight of Marx had to do with the progressive developments that often emerge from crises of contradiction. In Habermas, the "dialectic of forces and relations of production" as a potentially revolutionary relation is extended and elaborated to include communicative organization; that is, as a motive-forming interest.

Human language, as an outcome of intersubjectivity, brings together subjective needs and feelings, cognitive ability, normative motives, and transforms them into an intentioned project of action and desire. Percepts and values through utterance are transformed into projects of general and particular validity. Such action, normatively bound, reflects stages of economic and social development as well as it does stages of ego and moral development. The later work of critical theory has been to demarcate these stages, more fully, giving it the ability to name social psychological factors behind often paradoxical social movements (e.g., return to fundamentalism, neo-conservative politics and social acquiescence). The risk for those of us as educators who work in 'social reform' as a vocation is that the other side of the dialectic of maturity and regression, under an

organized capitalism, can occur. It is equally possible that the dominant institutional framework we all labour under "will gradually absorb communicative action" (Habermas, 1970, p. 106). In considering all our friends in this, I wonder if

Sociopsychologically, the era is typified less by the authoritarian personality than by the destructuring of the superego. The increase in adaptive behaviour (that we witness) is, however, only the obverse of the dissolution of the sphere of linguistically-mediated interaction by the structure of purposive-rational action.

(Habermas, 1970, p. 107)

In his more recent work on communication and evolution, Habermas (1979, 1981) suggests that social theory may be in a position to tie the development of technology (one level of the productive forces) to stages of formal cognitive development. In large measure he draws from Piaget, Kohlberg and the history of technological developments (see Freyer, 1965) in demonstrating how linguistic-cognitive structures mediate with productive forces. What Habermas inserts, analytically, between identity structures and economic organization in explaining the contradictory development of each is the world view of persons and of groups. Early work on communicative competence (Habermas, 1971) indicated the generative role (action and understanding) that shifting world views had in concert with both the semantic properties speakers held and their social setting of

communication. If these relations are elaborated in the directions research in critical theory proposes then world views of persons, of texts, of institutional expressions become one more access point for curriculum studies in understanding the deficits and possibilities of social reform programs. Since curricula encode social representations of the world, to more deeply investigate, using negative dialectics as prototype method, the concatenation of ordered world views, these 'grand suppositions' of particular rationality structures, also means disclosing the practical force of these particular mediations.

Habermas in his earlier works (1970, 1971, 1974) has relied extensively upon Freud to give projects of critical-practical theory its normative and emancipatory zeal. Through combining Marx and Freud, or characterological and social structure, individual development, at the level of persons is given collective, historical content at the level of institutions. For Habermas, as it was implicitly for the aforementioned, it is important to appreciate and thematize the mediations between the two levels of movement. Critical theory has come to accept that the therapeutic and psychodynamic investigations of Freud into consciousness, its style, origins, and functions also have implications for understanding collective social organization - not, however, as a mere transposition of insights to a collective level since the insights of analytic therapy for the person are causally organized. Freud's applied psychology

construed conceptions of normality, and deviance as 'disturbances of communication, behaviour, and organic function.'

However, what wants as a normal or deviant self-formative process can be defined only in accordance with the institutional framework of a society, then this society as a whole could itself be in a pathological state, when compared with other cultures, even though it sets the standard of normality for the individual cases it subsumes.

(Habermas, 1971, p. 274)

The extent to which there is homology of function, but not identity, between the structures of consciousness and those of societal forms according to Habermas' interpretation of Freud's metapsychology, if we accept it, secures the importance of communicative organization in the promotive tendencies of persons' political projects. That is,

the reality which the ego comes up against and which makes the instinctual impulses leading to conflict appear as a source of danger is the system of self-preservation, that is, society, whose institutional demands upon the emergent individual are represented by the parents. Consequently, the external authority whose intrapsychic extension is the superego has an economic foundation. ... The same configurations that drive the individual to neurosis move society to establish institutions. What characterizes institutions is at the same time what constitutes their similarity with pathological forms. Like the repetition compulsion from within, institutional compulsion from without brings about a relatively rigid reproduction of uniform behaviour that is removed from criticism.

(Habermas, 1971, p. 275, 276)

Habermas sees the tendencies of purposive-rational action in society to be embedded in an interaction structure that is carefully mediated by cultural forms such as media, community life, schools, and local civic expression. Since the communicative action organized in these structures must serve the interests of social labour, these linguistic and cultural resources are available to express group interests aside from reproduction. The latent contradiction in the deployment resides in the fact that this normative cultural system of interaction, embedded in the above forms requires to be 'institutionally stabilized' for the prevailing economic interests, yet this normative structure of interaction although it accomplishes a restless pseudoconsensus among persons also can become the means, the expression of transcendent interests. Not all expressed social and instinctual needs find gratification through the dominant social organization of everyday routines. Yet these action motives are not countered, Habermas argues, cognitively or discursively, as much as they are through affective forces. That is, the

...institutional framework consists of compulsory norms, which not only sanction linguistically interpreted needs but also redirect, transform, and suppress them.

(Habermas, 1971, p. 279)

The argument can proceed the following way. If social repression is partly achieved through organizing distorted

communication within cultural forms then as economic conditions shift and ego development occurs then the institutional framework of the society requires less ideological and political repression and more progressive forms of gratification can be tolerated. This is one dimension of the implications between styles of consciousness and the particular level of organization of social-cultural and economic development. Clearly, if I refer to progressive or mature forms of development it refers to the personal appropriation of freedom by those who experience suffering, suppression, or the failure of their projects. Radical change of this kind presupposes that we abandon the commodified transmission of help from centres of expertise and research. These changes must emanate from the articulation of locally recognized and expressed conflicts - in our case from the inner and outer boundaries of the school community.

It is important to remember how Habermas recasts Marx's historical materialism. By extending Marx's ontology of nature and social labour into a developed categorial framework the importance of work or labour and interaction or language is emphasized. Using Freud's model of psychoanalysis as a prototype method for critical theory's projects, Habermas has us understand the appearance and durability of power and ideology as relations of distorted communication. This suggests that in order to understand the problems of resistance, domination, and human praxis for social reform

and hence curriculum reform means that linguistic, cognitive, moral, and psycho-sexual development become formal topics of research in praxiology. Although no formal research or private opinion at present suggests a qualitative, progressive shift in our institutional frameworks, it is to the organization of communication in formal and informal settings that curriculum inquiry energies could be put and if we accept Adorno's dictum on the unredeemed object, that is, the bringing to public consciousness the possibilities of personal and collective development. To be sure this is no mere idealism but the laying of a basis for critico-formative projects in which human praxis is understood as the reconstruction of speech, cognition, and action - as modes that re-express intimacy, necessity and nature with others. Habermas (1979, C.3) has recently delineated the stages of moral consciousness and relational capacity that can accompany these ideal shifts in speech and action.

It is in Theory and Practice (1974) that Habermas suggests some of the important methodological caveats for a critical inquiry that seeks to inform political organization.

The theory thus encompasses a dual relationship between theory and praxis. On the one hand, it investigates the constitutive historical complex of the constellation of self-interests, to which the theory still belongs across and beyond its acts of insight. On the other hand, it studies the historical interconnections of action, in which the theory, as action-oriented, can intervene. In the one case, we have

a social praxis, which as societal synthesis, makes insight possible; in the other case, a political praxis which consciously aims at overthrowing the existing system of institutions. Because of its reflection on its own origins, critique is to be distinguished from science as well as from philosophy.

(Habermas, 1974, p. 2)

In partially dissembling this quotation, what the reader is admonished is that inquiry that seriously seeks and risks an understanding of radical curriculum reform will investigate the origins and context of the research problem as posed within a particular research community at the same time as it recovers the motives and interests of those doing inquiry within their personal structures of opportunity and commitment. Secondly, it maintains the former insights as it prepares for political action emergent from particular cultural and interactive fields in full recognition of the coercive limits, 'cooling-out' strategies, and interactive opportunities of state-society relations. In addition, this kind of inquiry, Habermas indicates, must be cognizant of the history of how political power has been used; and that of its distribution and appearance. It is within these kinds of constitutive contexts that we can attempt substantive projects of radical political criticism.

What then can be said about the organization or retrieval of power over practical questions in the form of public or practical reason? It is within the context of the public sphere that practical questions show their manifold implications

for reflection and action. The public sphere as I have argued earlier was a cultural form for the text, expression, and rejection of public opinion or normative perspectives on issues in the lifeworld. For the mercantilist class these were norms that were oriented action and could be validated or dissolved only through critical reason(s). Cognitive support, in the way of intellectual inquiry or theorising entered the structures of discussion of the public sphere to be integrated within communicative practices, in situ. Such theorising, as I have assembled, throughout this study for instance, leads not directly to correspondences in political struggle - it contains an explanatory and interpretive function for persons' interests, which are often latent or non-symbolized, in 'the reflexive formation of volition.' Hence, theorising through public discourse practices is reconstructive, clarifying, and anticipatory in that it sets the institutional and psychic preconditions for the organization of political action. In a real sense, it is through the public discourse that we, as self-interested groups, begin to recognize social domination in its density, as it corrodes our self-confidence and solidarity. It is through public discourse that we can see how resistance can be formed to those relations that play upon our guilt complexes and our sense of deficit at not holding expertise in understanding society. Political action requires that practical discourse over questions of real interest (see Geuss, 1981) be institutionalized within

publics prior to more collective¹¹ action. The objective within interested publics¹² then is the generation of a practical discourse that convenes the open, unconstrained, non-technical discussion of community problems - that is, by freely selecting participants. As I have argued in earlier sections what is key to public discourse as a practical accomplishment is the dissolution of distortions and compulsions in communication which are lodged in the social structure, in textual forms and traditions of interaction and in persons' consciousness. In broader terms what emerges through public discourse is the "general discursive formation of public will" (Habermas, 1974, p. 5). This structural organization of communication has become increasingly difficult as public issues are absorbed and depoliticized in the logic of technical hegemony. Public discourse, too, has the vital function of recovering the cultural contents of a class, ethnic, and vocational consciousness that aids in reforming a public tradition.

The university, under assault presently and contradictory at the best of times, ideologically committed as it is to critical scientific research, can serve as an advocate indirectly of the organization of viewpoints and political organization that would run counter to dominant state-corporate perspectives. Its history as an institution provides some precedent for internal and public 'discursive will-formation.' In our time the role of the organic

intellectual in Gramsci's sense, is typically more evident in groups allied around ecology, labour, and civil rights issues. The womens' movements, certain labour and ecology coalitions exemplify the possibilities of a practical discourse rather than most educational organizations or electoral politics. One difficulty, for those of us involved in curriculum planning is to recognize the important differences in organizational approach between those in the society who passively withdraw their consent from primary practices and those who are in a disguised, but virtual position for political action on concrete community issues. Symptomatically, the appearances of dissent are similar; practical methodology can begin to clarify the potentiality in different strata of consciousness.

The historical and political importance of curriculum work should not be undermined as epiphenomenal cultural practice. By re-institutionalising new patterns of discourse through school organizations, teacher education and development, the contradictions of liberal reforms in education can often be exploited. In severing curriculum development from its original authoritative bases in church and class, program content is relativized and laid open to discipline intervention. With a professional vocabulary of 'openness', 'individualization', and 'integration', content and form is vulnerable to counter-ideological influence. Bernstein (1971) has pointed to the contradictions

between psychologized social control and cultural alternatives of the 'new' curricula. The unboundedness of cognitive contents of interdisciplinary programs can affirm a kind of practical discourse in the planning and the pedagogy of such programs. For teachers and learners this would represent an extension in social learning patterns as themes mediate with organization/pedagogy in the formation of will. The underside of this contradiction best seen in the light of curriculum reform efforts is how 'affirmative' curriculum philosophies and their progressive vocabulary, often do little to ensure a practical discourse within classrooms and within the regions immediately outside them nor to generate new knowledge forms. The phenomenon of 'no-significant-difference' in implementation and development project history attests to the material power of appearances, as legitimation devices, in the organized economies of the capitalist state. Curriculum reform can be likened to the

"bold fiction" of liberal democracy which was shattered . . . by the restrictive conditions of production, a polarization of forces resulted . . . (and) a tendency has set in to reject as illusion the claim that political and practical questions may be clarified discursively, and to deny, positivistically, the truth value of such questions.

(Habermas, 1974, p. 26)

Public discourse can occur and become a practice-creative force if we consider its movement to be composed of at least three interests. One of these is constituted through the

moment of immanent criticism or the generation of critical scientific analysis of societal processes (see Horkheimer, 1940) - projected and historical. A second interest consists in the interpretive analysis of subject-object relations where text, event, and speech are subject to self-formative and conceptual analysis of their inner limits and possibilities as historical sediments in social-political time, or negative dialectics (Adorno, 1981). Thirdly, these two interests and their respective insights and thematizations need to be embodied in a progressive, public normative structure whose deliberations are conducted and resolved as the practical organization of communicative action directed toward political struggle, or public discourse. Public discourse contains the prior systematic insights on structural developments, the contents of consciousness and cultural text and the strategic and tactical planning of political action in reflective-discursive relations. As Habermas terms it, the organization of discourse within publics possessing real interests aims at the production of prudent decisions - (understood in its original sense). Practical method, as normative analysis and method, convenes these interests organizationally and publicly (understood as C.W. Mills usage) in substantive practico-creative projects of curriculum planning, development and evaluation.

Only to the degree that organized enlightenment and consultation lead to those groups toward which this is directed actually recognizing themselves in the interpretations actually become consciousness, and does the objectively attributed situation of interests, actually become the real interest of a group capable of action.
(Habermas, 1974, p. 32)

This is a reminder to those social reformers amongst us who, even in good faith, will use the clout of electoral social democracy or the gentle expertise of teacher consultancy models, or progressive methods of curriculum decision-making as the appearance of rational consensus unsecured in the hearts and minds of participants in a project. The truth of functional analysis and negation, in a practical method is never independent of the wills of those persons in resistance. It is in publics acting self-consciously in some semblance of solidarity over common interests, that have been arrived at through discourse they have convened, who can act humanely and critically, temporarily outside of ideology. Such groups whether intellectuals, lay organizers, or interest groups act on the understanding that the risks and outcomes of political action are considerations generalized as the responsibility of all participants as speakers to their shared discourse. In the heat of public discourse a group that considers the posture of its political action must reconcile any 'divergent' perspectives virtually within organized action.

Every 'theoretical' tendency or clash of views must immediately develop an organizational aim if it is to rise above pure theory. (Each tendency) is a tangle of individual deeds on the part of individuals and groups.... This tangle, confused in itself, can only acquire meaning and reality if it is comprehended within a historical totality... By gauging the situation, by preparing for action and by leading it such an analysis attempts to isolate those factors that lead from theory to the most appropriate action possible. (Lukaćs, 1971, p. 299-300)

Lukaćs implicitly refers to how preparation (public discourse) for political action is not only a test of theoretical insights and organizational finesse. It is above all a test of the limits of the motivational contents and moral insight possible for a particular public over a particular issue. How it assembles its inner relations in order that participants have purchase on the design and 'validation' of the inquiry so that they "know what they're doing" is indicative of the limits of its consciousness.

Such consciousness is carried forth and achieved through discourse. Discourse must be distinguished from mere reflective action since the latter seeks an automatic correspondence between experience, opinions, and outcomes. Reflexive action envisages participants exchanging experience, judgments and acting tentatively but compulsively in the light of these sequences. Discourse, however, seeks to argumentatively justify and marshal motive and insight in the validation of norms and opinions. It tries to express the speech-laden interest in consensus or understanding under conditions

of maximal freedom for deliberation. One objective of discourse organized around problem complexes is the achievement of an understanding of norms, events, ideas as to their actual and potential existence in the social world. Discourse recognizes that human speech, under conditions of political equality, presupposes that four orders of validity could or would be met ideal typically in the construction of intersubjective consensus. Discourse differs from reflective action in that it explicitly raises the question of the achievement of these tendencies in all speech oriented to true understanding. It is by recognizing these promissory tendencies in speech that communication organized as discourse can reflexively approach and secure the true or rational consensus - so important for public, political conduct. Discourse imputes "the idealization of pure communicative action" as the justifying norm that lies outside of all other norms of justification. It is upon this that the authenticity and praxis of "speaking and acting subjects can be judged." This is not only a normative-linguistic condition, for discourse, but a structural-political condition to be achieved in publics. Consensus through discourse is achieved if the four different orders of speech claims are realized. In any communication between speakers and hearers or participants in a focussed group (see Goffman, 1963) in which say, issues or problems or sentiments are being discussed, each person presupposes through the very act of speech the possibility of attaining

consensus amongst each other 'vertically, and horizontally.' That is, with each speech act come four suppositions or orders of claims that have to do with "the comprehensibility of the utterance, the truth of its propositional content, the correctness and appropriateness of its performatory component, and the authenticity or sincerity of the speaking subject" (Habermas, 1974, p18). That this speech carries cognitive or normative content means that the topics of deliberation are filtered through a network of deliberative, justification. It is the organization of communication as discourse that permits the testing and securing of these speech claims. If they are redeemed, so to speak, participants can infer that rational consensus has been achieved - or, the discursive, constraint-free formation of will. Clearly, this achievement represents a kind of communicative action suitable for the deliberative organization of conduct for political struggle or critical inquiry. These communicative norms are reformed only implicitly in reflective action, information exchange, monological or instrumental decision-making, and communiques - the possibility of actually achieving misunderstanding gross or subtle amongst participants is unclarified as are the political and prestige conditions which impinge upon or deform the structures of interaction that convene this talk. In the case that unreflexive talk is the mode of relations between participants, we can say that there is distorted communication sustained. Relations of ideology and domination are the

'essential' concealment of distorted communication and are thus action-laden or of material consequence in the world of their participants. Habermas indicates that we can project stages of moral-social autonomy and ego development from their bases in the experience of rational consensus with others (Habermas, 1979, C.3). Hence the degree to which discourse on themes of structural and existential significance, is consistently virtualized corresponds to shifts in world views of persons and thence to their cognitive-moral relations with others in the world around them. Reason organized practically and discursively is rich in implications for social praxis and world reconstruction.¹³ The historical importance of discourse for achieving rational consensus, or the frank dissolution of common interest is that the subculture of technical expertise and planning, we live with, operates unself-consciously in pretence of communicative action such that there is no self-correction possible, amongst persons who 'behave strategically.' There is an importance here for curriculum reform that should not be lost. In any social formation, such as organized capitalism in Canada, the constellation of interests in educational practice, say, inevitably obeys a "logic of force." The communication of interests that run counter-ideologically to dominant traditions cannot be easily or massively thematized as themes to organize. As a result what passes for 'public participation' and 'political discourse' in curriculum policy is mere appearance. It is important to note that

Marx understood that the bourgeois democracy of liberal capitalism 'had to remain as ideology and as false consciousness.' In part because of the contradictions between the organization and relations of production programs of democracy and reform could never be realized but were the idle, naive dreams of well-intentioned men. So, too, is the case of curriculum reform, as it is practised, in our time under organized capitalism. As legitimation and compensation measures are injected in to more remote corners of the social structure in the attempt to defuse and depoliticize dissent and withdrawal the appearance of critique and political partisanship grows. Yet, what seems to happen instead is the institutionalization of quasi-public traditions of debate and problem-solving secured in a "natural manner" but unreflexively. Citizens are treated to the orchestration of 'natural discourse' that suggests opportunities for their progressive rationalization. Two examples, that come to mind are the form of professional and community representation on provincial curriculum policy boards, and the kind of bounded allowances for critical exchange and debate allowed opposition electoral parties during the question period in provincial legislatures. In the first case the actual selection of representatives is severely contaminated, particularly as to what constitutes vocational excellence; and in the second case, there is such a dearth of structural support for the tradition of negation and opposition with no reasonable financial resources for issues research that in

these two examples the kind of activity that passes for critical, political constraint-free discourse is a sham - the form of the proceedings in effect merely ideological. I mention the second case, a typical one in most provincial legislatures where third party presence is a new event, since the parallels with alternative curriculum reform are striking in terms, for instance, of the thicket of procedural, legalistic subterfuge that persons must pass through and manipulate strategically to be "heard." Hence, I express faith in what has been called "radical reformism" as a communicative initiative at certain historical-political moments in our society. This represents, as both Marx and Habermas maintain, a faith in the capacity of ones' opponents to contend with you in dialogue where argumentative justification may be a serious option for deciding on policy and action. Changes in the general structure of education under organized capitalism make it increasingly difficult, however, to sponsor this kind of public communicative action let alone to couple the forces of opposition for revolutionary struggle. Both marginal and electoral parties show a dearth of political education in cadre training, and formally democratic decision-making structures that easily close under the press of opportunism and personal advantage. Notably, curriculum reform is paradigmatic of reformist, cultural practices where persons in organizations act toward expressions of progress encoded

within strategic-theoretic protocols which practically and cognitively render the organization of their enlightenment impossible. It is the practical organization of reason and commitment reaching toward "adult autonomy" and which must figure in all rational discussion that could begin to secure cultural-political projects transcendent of ideological deformations of human interests.

... reason as controlled insanity gains an oppressively acute sense under technological domination over a praxis,.... The motive of reason was already central and determining in myth, religion and philosophy; there it had the function of laying the foundation, within the manifold of shapeless phenomena, for the unity and coherence of a world; this motive lies on in a perverted manner in insanity. When the sciences, within a flux of phenomena in principle devoid of world, seek to wrest from contingency that which is empirically uniform, they are positivistically purged of insanity. They control but they do not control insanity; and therefore insanity must remain ungoverned and uncontrolled ... this way reason falls between two stools. Accordingly, the danger of an exclusively technical civilization, which is devoid of the interconnection between theory and praxis, can be clearly grasped; it is threatened by the splitting of its consciousness, and by the splitting of human beings into two classes - the social engineers and the inmates of closed institutions.

(Habermas, 1974, p. 282)

In sum, public discourse gathers together the other two moments in order to develop a dialectical criticism which actively embodies attempts at reconstruction. The tradition in which discourse is legitimated assumes, as

is the case of the public sphere, that moral and practical questions ultimately have a rational foundation and that their claims to "collective rightness" can only be settled discursively and in public discourse. This argument then overrides those of cultural relativism and technical-strategic decision - a relative of probability theory. This "cognitive ethics" suggests that the procedures for offering binding reasons for the acceptance or rejection of moral-practical and propositional claims can be found in the relations of discourse. Discourse can purchase these expectations because as a practice it thematizes persons' expectations for attaining consensus, and bespeaks for an idealized common interest, generalizable, and conducted under constraint-free conditions. Hence, there are two interests of socialization at work in discourse-achieved consensus: the tendency to understand personal interest as derivative of common interest or generalizability, and the politically-established access to free and horizontal communication. This is seen as secured historically through the humanization of democratic cultural forms, and ontogenetically as a transcendental interest of speech (acts).

A core element in my notion of public discourse is communicative competence (Habermas, 1971; 1979; 1981). The latter project is a practical-conceptual formulation that intends "to identify and reconstruct universal conditions of possible understanding" (Habermas, 1979, p. 1). What is significant about this for the study's purposes

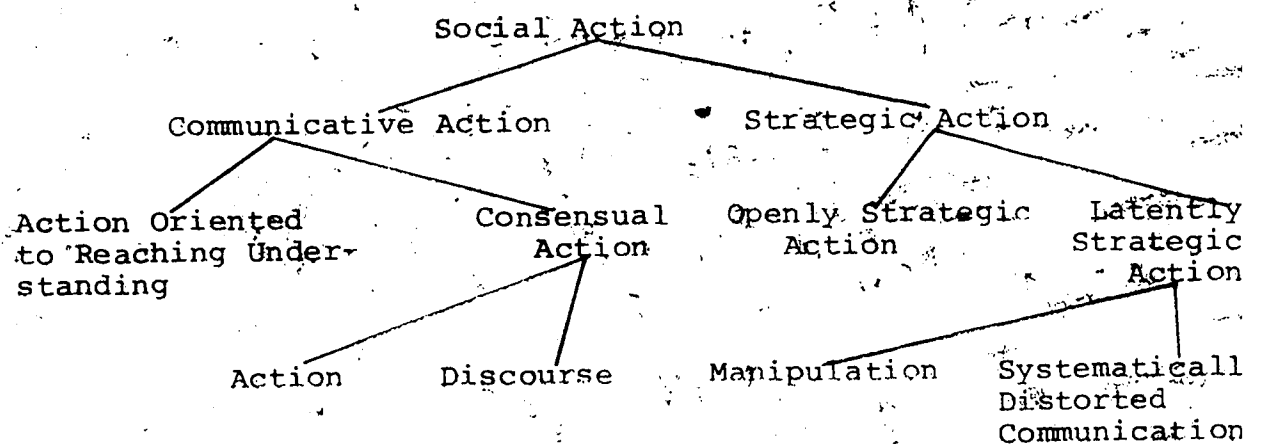

is that conflicts, strategic action, social action are all derivative of action designed to reach communicative understanding since each involves a virtualization of interests endemic to speech. To look to the organization of political conduct only outside of language is to deny key human traits and to fail to see speech, in its fully redeemed state as a social praxis - not of the mind but of material forms. Clearly, as is the direction in reconceptualist curriculum theory, gestural, bodily, and non-verbalized relations can form part of a critical, communicative praxis (see Pinar, 1983). These human relations, historicized, must become part of a broadened agenda of research in curriculum studies and radical curriculum reform.

Of the three moments of practical method that I dwell on in this study, none can prefigure the ultimate conduct of political struggle whether it occurs in our formal research communities, our schools and communities, or with focussed groups of publics. I have discussed in earlier sections the form and boundaries of the 'organization of enlightenment' through our knowledge of critical philosophy, of self-reflection, and of the organizational dynamics of capitalist society. I am unable to compose directly the form of political struggle. This can be justified discursively as a moral-practical action, in situ, by participants affected by such action. Only idealistically or dogmatically does it provide strategic recipes. What cannot be rationalized is the extent of personal and collective risk involved by those

who are engag . The degree of organicity, of inner subject-object relations of each moment of enlightenment can be read indexically by the presence of repressive or distorted communication norms. In reading these norms participants or researchers can determine only through discourse whether there is a systematic application of critical science theory, and self-reflexive and textual analyses productive of insight so that their testing is one of authentic confirmation. In a sense, like indices that can be read off, certain structural features appear sequentially in conversation if rational consensus and communicative action is accomplished. The following figure helps to organize the discrete possibilities of a social praxis generated from a practical method:

A Typology of Possibilities for Social Praxis Emanating From Practical Method

Figure 2

(adapted from Habermas, 1979, p. 209)

Each of the above discrete classes of action can be investigated empirically as can the generative socio-political conditions that give rise to each within focussed interaction settings. What I am proposing is that research protocols can begin to assess the extent of repression or distortion in patterns of speaking and hearing in concrete settings. It can also specify the formative and political relations that act upon participants in communication. A normative, cognitive ideal of communicative competence is used as an ultimate justifying norm against which 'processes of enlightenment', reform movements, institutional political democracy, and quality of lived program life might be assessed. The following section takes up some of the practical, empirical possibilities for curriculum and pedagogy.

It must be remembered, however, that such utopian blueprinting occurs against a particular normative horizon in organized capitalist society. Once outside the curriculum laboratories and seminar rooms are we as persons who reproducing ourselves, daily, able to resist, confront, or mobilize against the dangers of our cultural traditions, our civic and political autonomy being absorbed by extraneous planning? Part of our bulwark against this are the living connections our cultural lifeworld has with our means and relations of economic production. This practical reason which is an emergent practice of these relations cannot be severed from a concern for public, discursive justification. Habermas has suggested (1975) that structure of "bourgeois

consciousness" is undergoing changes which nonetheless are ambiguous. It is uncertain as to whether we are seeing the bluff of bourgeois civic culture being called unable to deliver (as Marx suggested) its political and economic dividends to the mass of persons, or whether school curricula patterns have shifted systematically enough that mature ego development has become regressive and persons' capacity to put forward and recognize practical interests has totally eroded.¹⁴ The efforts for renewal in curriculum reform, however, must preside strategically over these junctures in its social organization of research discourses.

CREATIVE HISTORICAL POSSIBILITY

As I have presented in earlier portrayals, one of Habermas' major projects has been the reconstruction of Marxist historical materialism. Human emancipation, for the former, becomes a practical activity and not one bound up solely with the level of technical development of productive activity. For persons, individually and collectively then, self-realization is both a self-formative process and a productive material process. In an era of political economy critique, class, was a major category of analysis. In our later era of sociological critique, ideology also becomes a second methodological concept of particular importance in the analysis of domination and social organization in organized capitalism. As a result of the recognition that domination proceeds as much from social psychological compulsion

as it does from economic deprivation, a broadened dialectic of political-economic critique and self-consciousness is called for. Clearly, work has begun on these needs; one that brings us closer to home in these projects when we recognize that our domination is conducted in terms of the manipulation of private needs as well as class position. When our labour and practical interests are in part directed to dissolving the dependence of consciousness on, or the recovery of consciousness from reified controls, our research, as practical renewal, must seek to understand language use and its role in creating possible objects of knowledge. The goal is the development of normative prescriptions from empirical research.

What are some of the structures peculiar to constraint-free communication that practical method is interested in portraying in order to understand more directly the creative possibilities resident in speech and in society? Habermas (1970) suggests constraint-free communication shows a non-contradictory correspondence between the three levels of non-verbalized communication. That is, in the acting person, verbalizations are found to match with behaviour, which in turn matches with gestural moves. Hence, no contradictions in meaning or intent, latently or explicitly can be detected in persons' performances. This suggests that praxical movement is embodied in a horizontal project that unites desire, reason, commitment and self-consciousness.

Constraint-free communication within which discourse falls partakes of an implicit intersubjective agreement of speakers in a community such that significations made by speakers are recognizable and shareable identically by all persons in this community. This feature speaks to interest in real consensus as one in which deliberation and event are geared to their redemption in the generalizable interest.

Constraint-free communication logically and practically implies that participants are conscious of the methodological distinction between subject-object, concept-object, essence-appearance, form-content, possibility-facticity as dimensions of social-historical space and time which they resist and produce. Speech operating under this recognition displays these distinctions explicitly in discourse with others over "issues" or "attitudes" or "conceptions" and, in textual formulations, pedagogy or curricula. Constraint-free communication does not simply will away these distinctions, if indeed the empirical work of researchers has revealed them.

In line with Adorno's views on subject-object or concept adequacy constraint-free communication preserves the importance of the particular, or the uniquely historical, in a constellation of relations of reflexivity and materiality. That is, language use is seen as a way of maintaining the face of personal identity structures and intersubjectivity. Equivalent levels of class and structure, region and state, or action and tradition reproduce this notion of the

irreducible particular as a starting point for interpersonal relations or formal research.

Constraint-free communication demarcates the verbal (often research) protocols for categories such as causality, time, history, explanation, resolution, and fact. Clearly, the kind of decision-making shifts if it refers to natural-physical events or historical-interactive events. The outcomes for discourse and action are altered considerably if historical time or social space are not used in accounting and planning for human action.

These properties of constraint-free communication, if actualized, work toward rational consensus in participants. When the properties analytically decompose, they become a normative standpoint that allows us to evaluate processes of communication (distorted or constraint-free), and institutional or societal structures. That is, practical method which builds upon this normative-linguistic core allows inquiry to reconstruct intrusions in communicative action, to reconstruct 'world-building' practices, and to materially challenge the bases of legitimation of the current social order. This method rests on criteria which reside within the actual structure of speech and within the subject-object constellations of society. It reveals the creative historical possibilities of this dialectic of resistance and possibility while it dispels the reified appearances of reform.

What is it within the internal structures of speech,

itself, that compels us to understand its potential for creative historical possibility? The issue of understanding is key to seeing the creative, dialectical core of the speech act. Understanding can simply refer to the commonsense agreement that two speakers have over a linguistic expression or turn of phrase - the boundaries of their shared thought fixed simply by that single semantic unit. Rational consensus or structural understanding implies a totality of agreement, not identity, in dimensions of action, intention, meaning, and reciprocity. Typically, such consensus is keyed to one issue, or policy, or attitude the social and epistemic significance of which is protracted and grounded through discourse. In many respects, the appearances of simple understanding and rational consensus are similar. In analysing the structure of socialized speech we are able to reconstruct the suppositions and conditions in general understanding. In ordinary communication, and even in formal verbal protocol in research circles, these presuppositions are assumed but never tested or explored. In such circumstances political conditions, internally or externally, and speech usage could determine misunderstandings and repressed communication would become the norm.

According to Habermas' particular formulation (1970, 1979), persons' sentence use in utterances is 'rule bound' in its relation to provinces of reality. Each sentence in use attends to the domains of physical-external reality, social-normative reality, and subjective-intentional reality.

The speaker attends to each domain concurrently and attempts to demarcate the boundaries of each; in other words, the speaker in utterance with others take up and accents each reality domain. Hence competence in communication represents the virtualization of claims, embedded in speech to representation, expression or subjectivity, and interpersonal action. (Linguistic philosophy conventionally ignores these kinds of considerations and concentrates on issues of conceptual usage and syntactic consistency in order to establish competence, see Chomsky, 1965; Hare, 1972; Wilson, 1963; Derwing, 1973; Taylor, 1960). Although these generative features are considered in Habermas' formulation of competence they are only a partial account of what is involved in the virtualization of speech acts.

In the recent work linking critical theory (Habermas 1979, 1981) with speech acts theory points to underdevelopment of our knowledge of the expressive and interpersonal dimensions of utterances. The parallels with the development of social science methodologies are clear. For critical theory it is the interpersonal function in utterance that is the more vital to be developed. Speech act theory as developed by Searle (1969) and earlier by Austin (1962) is essentially interested in the analysis of how it is we say something is in fact a doing. It represents the achievement of some relation between persons; that is, between speaker and hearer. Both Austin and Searle consider that the achievement or dissolution of the speech act resides in its

illocutionary force. This means that the nature of the speech act entered into by a speaker carries with it a normative obligation to call out in the hearer a particular relationship intended by the speaker. There are both general and specific conditions that must be fulfilled for the successful realization of a speech act to occur. I refer here to cases where speaker and hearer are in institutionally unbound or non-ritualized settings such that might occur in critical-practical projects, revolutionary situations, or in rational research discourse. In this settings the bulk of the warrant, its particular transmission, and its acceptance or not by the hearer are primarily accomplished by the participants to an action. These are cases in which tradition, institutionalization, or dogmatic precedents in language and meaning are relatively non-contingent upon communicative action. Although latent properties of all native speakers, it is only in the attempt to accomplish dialogue and to participate in discourse that the other modes of speech with their range of validity claims rise to the surface of interaction. Discourse provides a kind of 'bas relief' upon which to ascertain these claims discursively. The following figure helps to summarize the range of points discussed.

Discourse and the Progressive Humanization of Conduct

Figure 3

<u>Domains of Reality</u>	<u>Modes of Communication: Basic Attitudes</u>	<u>Validity Claims</u>	<u>General Functions of Speech</u>
"The" World of External Nature	Cognitive: Objectivating Attitude	Truth	Representation of Facts
"Our" World of Society	Interactive: Conformativ Attitude	Rightness	Establishment of Legitimate Interpersonal Relations
"My" World of Internal Nature	Expressive: Expressive Attitude	Truthfulness	Disclosure of Speaker's Subjectivity
Language		Comprehensibility	

(adapted fr. J. Habermas, 1979, p. 68)

In order to come to a point of true consensus or understanding speech as an utterance between persons must display what is called its "double structure" of reflexivity (Habermas, 1979, p. 41). This means that a sentence aiming for consensus, rather than, say, a command to someone to do something, communicates propositional content and it communicates how the communiqué is to be taken by the hearer; that is, it indicates as an expectation the role the hearer should assume interpersonally within a particular utterance. Commonly, ordinary speech assumes the double reflexive structure but does not pursue it thematically as a topic between participants. Often, formal language, particularly, that derived from instrumental thinking often communicates or 'transmits' propositional content or representations of an

external, possibly reified world. Most of the validity claims pre-supposed in some way by this communication are either unchallenged, ignored, or non-discursively sustained. That is, relations of unequal power intrude upon participants' communicative practices. Clearly, this kind of analysis would continue in a number of directions such as the implications understanding language use in this way has for personality, interpersonal relations, styles of discourse, carries with it an assertion and a promise utterance by utterance. It asserts the intention and reality demarcation claims of the speaker, or text, or tradition and makes to the hearer/reader a promise of entering into a certain kind of relationship with the speaker by virtue of this communication which he/she will reciprocally honour. This illocutionary force of redeemable speech acts builds up a level of intersubjectivity which can be acted on one way or another by the participants. Either the claims put forth by the speaker are received unexamined by the hearer; or the hearer declines the relationship that is promised; or the hearer accepts the interpersonal force of the utterance and extends their incipient intersubjectivity in a discursive redemption of the claims that the speaker promotes. If these are found through dialogue or discourse to be unjustifiable claims, then the opinions, decisions, or actions that are part of the discourse are rejected. It is important to see the speech act, its contextual conditions for justification, and the upshots of the critical and practical discourses; if

sustained, are concurrently political, cognitive and emotive activities. Each utterance received and interpreted in the nexus of participants becomes a specific claim because of its content and feelings but also it is a general claim because of the conditions under which it is debated and resolved. That is to say, hearer and their participants in a dialectic circle can be "rationally motivated" to accept the assertion and promise of the utterance. Discourse, in this process, goes beyond rational assent because it touches upon and thematizes the different levels of reality such as subjectivity and expressivity such that they are integrated formally in the decisions and actions of participants. To the extent that speakers and hearers make explicit the four claims to validity and achieve some joint congruence of the four 'domains of reality' demarcated by speech in their project-specific utterances, then they approach a state of communicative competence. This, then, is one sense of the idea of 'discursive will-formation.'

Utterances can be 'cashed in' at two primary levels of action. Either speaker and hearer have the obligations to discharge the expectations for understanding in an immediate sense (that is, an immediate affirmation is what is wanted) or in a mediate sense where the speech obligations are extended in a series of actions. The mediate extension and redemption of mediate speech acts is of particular interest to this study and its interest in the analysis of curriculum

reform. For in this case speech claims, verbal or textual, are often made about the truth value of curriculum (cognitive attitude), or, the appropriateness of particular theoretical or developmental strategies are often claimed (interactive or expressive attitude); or, the sincerity or authenticity of competing conceptions, or analyses of curriculum, or planned reforms are often raised. Each of these claims when made problematic can be tested and justified through theoretic and practical discourse for its truth value, its appropriateness, its authenticity, and its comprehensibility as a curriculum object embedded in the social-political constellations of the society we live in.

In the final analysis, the speaker can illocutionarily influence the hearer and vice versa, because speech-act typical commitments are connected with cognitively testable validity claims.

(Habermas, 1979, p. 63)

This means moral-practical claims, cognitive-propositional claims, as well as claims to political conduct can all be investigated in principle. Speech acts

are embedded in relations to reality in such a way that in an acceptable speech action segments of external nature, society, and internal nature always come into appearance together.

(Habermas, 1979, p. 68)

According to Habermas (1970) idealism and the counter-factual nature of the speech act is sustained primarily, only, by

world views that become barriers to will-forming communication. Ideological practices at the institutional level have their practical correspondences in the neurotic disturbances of the individual. This I believe is an admonishment for each of us doing research in pedagogy and curriculum.

Discourse, as practised ideal typically, implies that decisions-made, theories developed, attitudes and actions that arise as topics in publics or other interest groups depends finally on the stronger and more elegant argument. It suggests that ethical, political and material actions are ultimately rationally and discursively settled; that is, no other criteria ultimately can be standpoints by which to organize enlightenment internally and collectively. Discourse, as in the public discourse of the practical method, has been conceived to be a "radicalization of argument" in topics that become claims, which tested or justified, altered, accepted, or discarded and enter the stream of participants' political wills. Theoretic discourse as an analytic distinction from practical/discourse would initiate its process with representational statements and sequentially arrive at a knowledge and ideology critique. Practical discourse initiates its processes with motive or normative expressions and sentiments which produces sequentially critical-practical will. If the internal validity claims of the object 'statements' have been met, and the situated political relations have been neutralized, then a rational consensus can emerge reflective of the lifeworld interests and

intentionalities of the collective project. At the same time it can be assumed that because of validated knowledge of the structural conditions of the society within a perspective of species global history that participants are in a position to consider questions of political strategy. It is the anticipated situation of justice, equality, and truth grounded as it is in the ideal speech situation, that permits the connection between discourse and action or progressive emancipation to be seen as a transcendental species interest. The construct of the ideal speech situation allows those in human science to do the necessary evaluation of intellectual-cultural production, of distorted or ideology-laden or neurotic communication and to organize for the legitimacy of critical-practical action. Clearly, there is a dialectical, yet not dialogical relation between individual development and social evolution, shifts in the structure of formal and practical thinking, and the volitional capacity for theoretic and practical discourse.¹⁵

I can imagine the attempt to arrange a society democratically only as a self-controlled learning process. It is a question of finding arrangements which can ground the presumption that the basic institutions of the society and basic political decisions would meet with the unforced agreement of all those involved, if they could participate, as free and equal, in discursive will-formation. Democratization cannot mean an a priori preference for a specific type of organization, for example, for so-called direct democracy.

(Habermas, 1979, p. 186)

In summary, the practical method constitutes itself normatively and analytically as an anticipation of the good life - one that is grounded in its criticism of prevailing social arrangements. Each of the three moments interacts one with another in a practiced-creative project. Embedded within these relations of research practice is the core of a communicative ethics.

Immanent Criticism

This represents a way of identifying an alternative organization of societal and human resources that promise a progressive humanization of material and learning capacities based on a criticism of present forms. This has taken the form of functional critique and utopian theorising, that is traditional versus critical theory.

Negative Dialectic A

The former category overlaps with negation in the sense that in both cases assessment through criticism are made of the necessary pre-conditions for revolutionary human transformation. This would refer to the presence of rational social learning forms and levels of moral consciousness appropriate for the discursive formation of democratic organization.

Negative Dialectic B

So that material and human resources, social learning and consciousness structures are plausible as alternative

forms in socio-cultural transformation then must the internal relations of self-knowledge and formal knowledge represent a concept-object adequacy which develops the possibilities in each. This involves the thematization through concept-object relations of possible historical tendencies meaningfully portrayed and discursively apprehendable. Adequacy of the inner relations of objects is significant, too, for the action that such understanding will promote.

Public Discourse

This involves in the broadest sense of practical method the reflexive capacity to situate participants biographically and structurally, in the conditions of domination and resistance of their society. Communicative action allows persons to experience these conditions as "socio-historical relations." Liberation, choice, and action discursively grounded become possible in the projects of publics.

It typifies a conception of freedom that analyzes the content and form of existing struggles within the context of their historical genesis and development ... modes of reasoning, interpretation, and inquiry develop a critical capacity to the degree that they pay attention to the flow of history

(Ciroux, 1981, p. 117)

One of the most significant developments in educational theory over the last decade has been the breaking-free of curriculum theory from the slavish orthodoxy of mainstream social and behavioural science research and their practices of social

apologetics. At this point at the end of much fruitful alternative intellectual stance-taking in curriculum, it seems that we ought to embark on a second generation of scholarship in the field and begin to do the research and development tasks that our well-cultivated positions have called for. The risk if we do not is that our language and our actions will lapse into that same kind of opaque blindness and sclerosis that our ten year project in intellectual pluralism and neo-Marxist adventures has so vehemently criticized in earlier, instrumentalist versions of "doing curriculum". If we do not engage in a kind of 'de-exoticization' of our theoretical projects and relate these cultural topics to the other real questions of resistance, intimacy, competence, and community that are bound up with understanding curriculum phenomena, then we merely exchange one form of arrogant elitism for another; that is, substituting the phenomenologist for the salesman of the medicine show. What we are faced with, as Henry Giroux (1981) has said, at this point of our intellectual and political history are the tasks of self-renewal and self-criticism. He argues that in order to understand the essential underdevelopment of curriculum as a field means to see how ideology, dominant institutional interests and our theoretic object relations interpenetrate one with another. In another sense this means that our modes of inquiry and discourse become hollow ones lacking the potency to penetrate our commodified vocational and civic existence. Moreover, although current curriculum language

'talks a good show' about contradiction, injustice, and repression in classroom, through curricular text and pedagogy, and in macro-structural relations, its capacity to rationally and compellingly motivate us to act politically as citizens and researchers is not apparent. One of the arguments I make through this study is that as participants interested in new horizons or comfortable niches, we do not really know the realities we inhabit and reproduce. We have forgotten or never known depending on the mobility circumstances of our careers what in social reality confronts persons like ourselves in our deepest anxieties that incites forgetfulness and disavowal of struggle and intimacy with others. Hence we are not positioned existentially, intellectually, or politically to sponsor, 'with a good heart', the only kind of theoretic and development work that curriculum for human possibilities is warranted to pursue. This kind of position can be pursued infinitely but as an overall research strategy I have proposed that our concerns must be directly concerned with coming to know the textures, structures, and symptoms of routine human life in our culture. This involves coming to know the phenomena

...that reproduce and support forms of mystification and ideology that conceal the essence(s) of reality.

(Giroux, 1981, p. 117)

I am attracted to posing the phenomena of curriculum reform of our own vocation and of social reform of our own society as key issues for research and practical renewal in the opening cries of the second generation in curriculum theory. We

must 'search for truth beyond the false harmony between subject and object' or between biographies and history. A task of curriculum theory, too, is to generalize the conviction for those who receive the formal products of curriculum work that the social world may not in fact be arranged as they see it.

Practical method as an historical and intellectual formulation, if organized as a generalizable interest, has strong implications for the conduct of future curriculum research, for the development strategies of the field, for pedagogical practice, and for our intimate relations with others as private persons, co-workers, and citizens. These latter concerns we should never forget for they so often carry our tangible sense of how the dominant reality is experienced by us conditioning our intellectual efforts and affecting whether we relate important issues through communiqués with our students and co-workers or whether we seek conditions of discourse. We embody in our actions and speech the substance of disavowal and promise in curriculum reform and social reform that I argue are the necessary grounds for moving paradigmatically to a second generation.

What generalizable practical method does for the organization of curriculum theory is to hold out promises that can only be redeemed by those participants in the field as researchers, teachers, and students committed to other visions.

Practical method supplies the understanding that schools, curriculum, and pedagogy ought to be examined in a context of history, understanding, reproduction and production. As a method it seeks to show the multisided determinations of particular cultural objects linking our knowledge of them with specific normative interests.

Practical method forces us to think relationally about knowledge, classroom social relations, values, and between school and society. It attempts to raise common sense consciousness to new, globalized levels of understanding.

Practical method is committed to a view of the unfolding, creative subject. It is through a radical pedagogy featuring critical dialogue and non-authoritarian social relations that we can re-establish our intimacy with the creative, caring centre in each of us. Practical method though its conceptual categories can reconstruct practically for teachers and students the formative conditions of the hidden curricula and school evaluation arrangements in terms of their own experience.

Practical method contains in each of its moments a transcendent quality referred to obliquely by Adorno and Marcuse as the negation of the negation. Transcendence in those terms means to refuse to participate or assent to problematic or duplicitous practices in everyday life, in vocation, in political and civic endeavours that sustain a 'radical evil' in personal and collective relations with transcendence, to deny a validity to social forms that arrest

us developmentally means that its denial once accomplished is refused as well. Contained within the structure of criticism is a reconstructive core that 'emancipates our sensibilities, imaginations, and reason' in subject-object relations.

Practical method sponsors as the duplex of negation the ideal organization of human communities as a reflexive social learning. Curriculum planning informed by historical materialism, reconstructed, means that the 'development of productive forces can proceed in conjunction with the maturity of forms of social integration so that there is development of learning ability in two dimensions - progress in objectivating knowledge and in moral-practical insight' (Habermas, 1979).

Kosik reminds us to make a personal project of identifying the particulars of the pseudo-concrete.

The world of reality is not a secularized image of paradise, of a ready-made and timeless state, but is a process in which mankind and the individual realize their truth; i.e. humanize man. The world of reality, unlike the world of the pseudo-concrete, is a world of realizing truth, a world in which truth is not given or pre-ordained, and as such copied, ready-made and immutable, in human consciousness, but rather a world in which truth happens. This is why human history can be the story of truth and the happening of truth. Destroying the pseudoconcrete means that truth is neither unattainable, nor attainable once and for all time, but that truth itself happens, i.e. develops and realizes itself. (Kosik, 1976, p. 7)

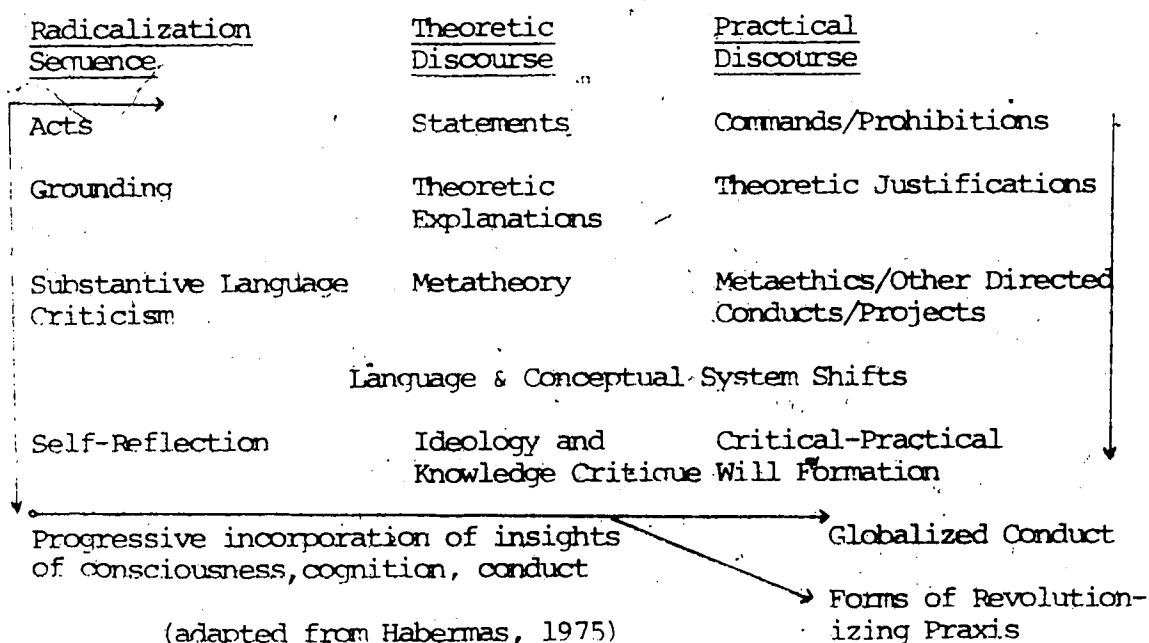

FOOTNOTES

1. Professor Herman Tennesen, University of Alberta suggests the definition of praxis given in Klaus' and Buhr's Philosophisches Wörterbuch is as historically comprehensive as any. This study borrows partly from this definition. "The word praxis is a philosophical, sociological and political keyword with a somewhat loose and variable use. The standard definition could be rendered roughly as follows: "Praxis" denotes the total societal process which consists of the transformation of the objective reality by the humanity. Praxis is the objective activity, all the doings ("das ganze Tun und Treiben") of the societally united human beings in their effort to change their natural and social world ("Umwelt").
2. For an exhaustive treatment of the relationship between the organization of science, modes of production and social control outcomes in history consider the work of J. D. Bernal's Science in History 4 vols. (1969); C. C. Gillespie's The Edge of Objectivity (1960); I. Zeitlin's Ideology and the Development of Sociological Theory (1968), S. Hughes' Consciousness and Society; J. Habermas' Knowledge and Human Interest (1968); I. Meszaros' Marx's Theory of Alienation (1970) amongst others.
3. Varieties of conception of theory and practice are given extensive historical review in N. Lobkowitz' Theory and Practice: History of a Concept from Aristotle to Marx (1967); A.S. Vazquez' The Philosophy of Praxis (1972); K. Axelos' Alienation, Praxis and Techne in the Thought of Karl Marx (1967); J. Hoffman's Marxism and the Theory of Praxis (1975).
4. Radnitzky refers to Karl Popper's distinction within his criticist frame of reference to open societies and closed societies in The Open Society and its Enemies (1945).
5. The conscientization work of Paulo Freire in Chile, Brazil, and Guinea-Bissau comes to mind as instances of radical pedagogy that leads to humanized, political action. Culturally and intellectually the problems of consciousness and enlightened political participation differs in the metropole countries of organized capitalism. Structurally, of course, we are linked ironically as brothers and sisters and, as exploiters in a global network. The possibilities for political education in

North American education must come through curriculum networks elaborated around our own regional and community expressions of global underdevelopment. Practical method in part draws from theory and practice of critical social theory founded on the terrain of Europe and America. Curriculum workers in Canada can draw from these traditions yet must structure their work methodologically in such a manner that they are open to our own dimensions of colonized space, time and symbol and to the intellectual and political resources of our regions. See P. Freire's Pedagogy in Process (1978), and M. Novak's Living and Learning in the Free School (1975) and A. Burton's The Horn and the Beanstalk (1972) as early attempts at cultural-political transformations through the schools. Counts ought to be alive to comment on these projects!

6. I make analogy here to the distinction found in Chomsky's (socio) linguistic theories between a subject's capacity for linguistic performance and language competence in social settings. Habermas (1971) takes these distinctions and builds a normative model of communicative competence which can be indexical for the political repression resident in speech acts. I take up this issue in a later section.
7. See R. W. Johns for particular curricular and pedagogical contours of a social studies for global citizenship based upon a non-Marxist view of human nature and social-cultural development in the world in Theory and Research in Social Education, 6:2, 1978.
8. I use practical, here, in the special sense of achieving worldly and relational awareness through thematically-inspired degrees of heightened intersubjective encounters with others. Curriculum deliberation would be a possible instance where the re-examining of themes can bridge the persons' mutual estrangement. Practical as used here galvanizes structural understanding and restores competence to act insightfully in concert. It is similar to Ricoeur's notion of giving a home to interpretative activity.
9. I refer here to the tendencies of social science, rather than human science, to posit the development of social forms in either mechanistic metaphors (eg. vulgar materialism, systems theory) or atomic-subjective centres of meaning (e.g. idealism, transcendental phenomenology, linguistic analysis.)
10. For an elaborated discussion of the public sphere and its civic organizational potential in organized capitalist societies see in English, J. Habermas (1975), (1974) intro. c. 6, 7; (1970) text; (1970) c.5 and Strukturwandel der Öffentlichkeit (1962) text.

11. See R. Geuss (1981) for an acceptable view from an analytic philosopher of the concept of 'real' interest in critical theory.
12. I rely upon the sense of 'publics' that C. Wright Mills employs in "The Structure of Power in American Society" in Power, Politics, and People (Oxford, 1963).
13. It is, I feel, quite unfair and more than annoying to continually charge Habermas with practising a form of cognitive idealism or 'talk as purity' detached from the concrete world of everyman, etc., etc. What is alarming in my experience is that presumably serious intellectuals take not the time nor the interest in understanding the core assumptions of Habermas' sense of communicative competence and their solid grounding within an historical-materialist dialectic. The motive of the former seem to be a fear of systemic thinking that may entrap their glorious narcissism preventing it from being admired.
14. Habermas in Legitimation Crisis (1975) p. 141 offers only tenuous projections about the fate of the individual and historical consciousness under the structures of advanced capitalism. One knows not on this account whether to fall into chronic despair or to take more decisive action - first, of course, at the level of personal lifestyle.
15. The organization and sequence of discourse developed through practical method has distinct parallels with Habermas' notion of the "radicalization of argument" in J. Habermas (1975) 'Wahrheitstheorien' in Fahrenbach, ed.

PART II
HISTORIES OF DISSENT AND
RESTRAINT IN SCHOOLING

They, the people. - The circumstance that intellectuals mostly have to do with intellectuals, should not deceive them into believing their own kind still more base than the rest of mankind. For they get to know each other in the most shameful and degrading of all situations, that of competing supplicants, and are thus virtually compelled to show each other their most repulsive sides. Other people, particularly the simple folk whose qualities the intellectual is so fond of stressing, generally encounter him in the role of those with something to sell, yet who have no fear of the customer ever poaching on their preserves. The car mechanic, the barmaid, have little difficulty in abstaining from effrontery: courtesy is in any case imposed on them from above. If, conversely, illiterates come to intellectuals wanting letters written for them, they too may receive a tolerably good impression. But the moment simple folk are forced to brawl among themselves for their portion of the social product, their envy and spite surpass anything seen among literati or musical directors. In the end, glorification of splendid underdogs is nothing other than glorification of the splendid system that makes them so. The justified guilt-feelings of those exempt from physical work ought not become an excuse for the 'idiocy of rural life'. Intellectuals, who alone write about intellectuals and give them their bad name in that of honesty, reinforce the lie. A great part of the prevalent anti-intellectualism and irrationalism, right up to Huxley, is set in motion when writers complain about the mechanisms of competition without understanding them, and so fall victim to them. In the activity most their own they have shut out the consciousness of *tat twan asi*.¹ Which is why they then scuttle into Indian temples.

(Adorno, 1974, p. 28)

1. 'Thou art this': mystic panteist formula of the Upanishads.

CHAPTER 4

PAST & PRESENT PROGRESSIVISM

A CRITICAL HISTORY

A BRIEF OVERVIEW OF THE FIELD

Theodore Brameld, second generation leading representative of the 1930's social reconstructionist movement and a figure determined not to preside over the demise of that politically conscious variant of progressivism, argued in 1971 that part of the public school's task was to strive for

a new articulateness, a new sense of collective strength, a new wrathful but righteous indignation, a new hope for the achievement of worldwide democracy for mankind - all of these are mingled together. In this vast, rumbling, clumsy infinitely powerful mass of hundreds of millions of human beings lies the great reservoir of strength for tomorrow's education. Here, indeed is the fountainhead of all utopian potentials presently emerging. The immediate task before the (teaching) profession is to draw upon this strength and thus to strengthen control of the schools by and for the goal-seeking interests of the overwhelming majority of mankind.

(Brameld, 1971, p.356)

Some have argued, as does Charles Bowers (1969), that with the exception of Theodore Brameld and the lesser known philosopher of education, Isaac Berkson, (1958) no direct conceptual links or transpositions of the 1930's reconstructionist position can be found in contemporary curriculum or educational theory. Although this study disputes that view, particularly with reference to the social

studies, the lineage from 1930 to 1978 is difficult to detect conceptually and practically. Though much of the flamboyance, public rhetoric, and optimism of the position has dissipated, it is now articulated, I feel, most cogently in the curricular and instructional proposals of certain schools of thought in social studies education. (Shaver, 1977). Historically and currently in the social studies, and in educational theorizing at large a profound sense of malaise, disillusionment and cynicism concerning the nature of institutional life, of knowledge and of social purpose prevails. (See Mehlinger, 1977). In more specific terms those representative of the 'reconstructionist' position make the assumption that a sector of the education establishment, such as the schools, is obliged to organize actively for radical institutional and social change.

Systematic social reform proposals were being articulated as early as the late nineteenth century in North American education. Progressive education reform proposals either directed their attention in broad terms towards social amelioration strategies for the poor and dispossessed children of North American society or focused their efforts on a 'humanization' of the institution of schooling through revisions of method, content and teaching style. The period after 1920 saw a distinct crystallization of these tendencies, each derivable to some degree from John Dewey's pragmatist philosophy. Both a child-centered wing and a radically reformist wing emerged. An uneasy relationship that persisted

between the two schisms was institutionalized with the appearance of the Progressive Education Association in 1919. Until at least the mid 1930's the child-centered wing which emphasized creativity, learner interest and integrated curricula was the dominant fraction that held professional and public attention. (See appendix VI for a more extensive discussion of these intellectual-political cleavages in progressivism).

In a context of economic depression coupled with political cynicism in North America (and the western industrial world) the reconstructionist group clustered around faculty at Teachers' College, Columbia University. This group revisited some of the larger concerns of the early years of the century in which teachers and related practitioners were exhorted to take the lead fashioning a 'new and more humane' society. This plea transcended early notions of progressivism that dealt with individual development and student acquisition of social coping skills in the face of rampant change. George Counts and other Progressive Education Association members such as John Childs, William Kilpatrick, Harold Puga and Jesse Newton, developed through their publication, The Social Frontier, a plea that teachers, qua professionals orient themselves and their students through the schools to actively combat social injustice and to systematically strive for political and institutional change.

The cluster of educators from Columbia University congregated in the late 1920's to discuss the relationship of the schools to an industrialized society. They considered how education could become a more effective instrument in

humanizing society by equipping teachers and students with the intellectual tools necessary to understand and direct social change. Lawrence Cremin (1961) quotes from the writings of William Kilpatrick who argues the task of education was

to prepare individuals to take part intelligently in the management of conditions under which they will live - (and) to equip them with the intellectual and practical tools by which they can themselves enter into direction of (social) forces.

(Kilpatrick, 1933, p.269)

Such an outcome was to be partly achieved by revising professional training. By placing more emphasis on history and the social sciences, it was felt that teachers would be better informed on pressing social issues. By altering the educational system, teachers and students could play a much more central role in school management. (Cremin, 1961). It is important to appreciate the central significance George Counts played in the reformist educational program. Although the reconstructionist movement extended far beyond this individual to bodies such as the National Education Association and to the legislative level, in the United States, Counts historically seems the most politically salient and eloquent spokesman for the movement. Counts was prompted to action by an assessment of educational practice characterized, as he saw it, by class bias and ideological subservience to the interests of liberal, competitive capitalism and

individualism. This position could be contrasted with the collective mass welfare notion for all citizens. As Counts wrote in 1932:

There was consequently a great and fateful cultural lag. Almost everywhere (the school was) in the grip of conservative forces and (was) serving the cause of perpetuating ideas and institutions suited to an age that was gone.

(Counts, 1969, p.28)

His earlier arguments were based on the inseparable relationships of educational institutions to political and economic activity. He argued that no educational institution could be completely impartial or without bias and value assumptions since "the school must shape attitudes; develop tastes, and even impose ideas,..." and "accept full responsibility for its acts". (An accepted purpose for education was to prepare the individual as a future citizen to contribute to the direction of social change.) As early as 1932 Counts enunciates some of the progressive criteria of reconstructionism by saying

...it must emancipate itself from the influence of this class, face squarely and courageously every social issue.... establish an organic relation with the community, develop a relativistic and comprehensive theory of welfare, fashion a compelling and challenging vision of human destiny, and become less frightened than it is today at the boogys of imposition and indoctrination.

(Counts, 1969, p. 259)

Counts' comments on schooling support the contention

that there are present-day educational and curricular descendants of the field who at least partially address some of the elements in this reconstructionist stance. Donald Oliver, in a 1976 treatise (Education and Community), argues extensively for a revival of authentic community structure wherein species-given primary bonds and relationships are sustained. The school, with a narrower function than presently, is charged to integrate its practices and roles with those of the primary community.

Coupled with these general prescriptions for educational organization, reconstructionists urged the formation of militant teacher organizations closely allied with labour unions and political interest groups. The journal, The Social Frontier, was a forceful medium for conveying these exhortations and illustrating, in explicit terms, the reciprocal relationship between politics, the economy and educational theory and practice. Theodore Brameld, in 1935 in The Social Frontier, suggests to practitioners that

...realistically minded teachers might profit, therefore, by greater acquaintance with Marx than most of them made through classroom channels. If they do so they will find that several of his basic postulates are likewise those of a considerable group of progressive educators and liberal political philosophers today. (He includes Charles Beard and John Dewey in the former category).

(Brameld, The Social Frontier, 2:4, p. 53)

Brameld proceeds to sketch some guidelines of classroom method:

implied by the Marxian approach by which progressive teachers can to some extent be effective while living in the midst of a capitalist society.

(Brameld, The Social Frontier, 2:4, p.58)

Such advocacy ranges from dissolving the notion that there is any philosophy of neutrality, the problem of student internalization of value freedom, the ethics of civil disobedience to teachers' identification of themselves as class workers in common with non-professionals. Not only were teachers to radically restructure curricular content, methods, and community learning experiences, but also the need for "persuasive and revolutionary" opposition to capitalism is important, (and)

that word and deed are functionally mutual phases of the general task.

(Brameld, The Social Frontier, 2:4, p.56)

The interrelated notion of word and deed, or theory and practice, are concepts to which I will return in a later section of the study. In a general sense here Brameld as we interpret him takes these terms to be integral, in a politically critical sense, to educational practice. Indeed the argument can be made that such concepts can be developed as criterial to a critically-reflective or emancipatory social education. As such it could contribute to ideas about knowledge, truth and validity if teachers were to develop a critical, social studies curriculum. In the development of this section I will tap something of the ethical and philosophical intents of the reconstructionist movement as it

pertains to contemporary exemplars in the social studies.

Despite the apparent paucity of reformist views within the reconstructionist movement, a number of competing schisms or sub-paradigms co-existed during the 1920-1935 period. (See appendix VI.) Harold Rugg, a social educator, during this period developed and introduced the first nationally-used set of composite junior social studies texts and monographs. His curricular intent was to equip students in the decision-making skills in a time of rapid social change. However, both Rugg and William Kilpatrick showed considerable opposition to Brameld's polemical stand regarding teachers' involvement in class struggle. Further opposition to the extremist position came from John Dewey, once it had been codified in a 1933 Progressive Education Association article entitled, "A Call to the Teachers of the Nation". This article contained the same strident tones as Brameld's later article in The Social Frontier. Considerable reinterpretation of Dewey's experimentalist legacy was occurring at this time amongst the partisan interests within reconstructionism. Although this legacy of pragmatism and experimentalism lent considerable 'theoretic justification' to the developing reformist position that "education is the fundamental method of social progress and reform" (Dewey for Social Frontier, 1935), it was modified by the sentiment of the child-centered faction (men such as Parker, Kilpatrick, Childs, Rugg) that the schools were not instrumentally in the position of building a new social order by themselves. Original experimentalist postulates denied the use of indoctrination-type teaching styles in opposition to Counts'

and Brameld's felt needs to do so.² Moderate or child-centred reconstructionists such as Kilpatrick, Dewey himself, Boyd Bode, and John Childs demonstrated more fidelity with the spirit of Dewey's philosophy and contributed toward a theoretical framework for integrating politics with education. Their argument appeared in The Educational Frontier (1933). This work essentially involved sketching a model of school-community relations and ideal typical program features that would ensue from the basic reconstructionist position. The school was to be seen less as a forum for knowledge acquisition, per se, but more as an ideal community wherein people engage in cooperative problem-solving and self government regarding social problems and value issues of the community. These issues would compose the core of the curriculum. Although, understandably, some confusion surrounds the Deweyan-derived form of instructional method to be used, there was general agreement amongst the extremist and moderate schisms that "the teacher could (was to?) provide leadership in remaking society according to his idealized conception of man...". (See appendix VI for further discussion on teacher autonomy and Dewey's legacy.)

The issue of whether experimentalist premises and the so-called (physical) scientific method, from which the instructional design arose, necessarily avoided classroom indoctrination toward a new social order did constitute a symbolic political struggle in itself, subject to historical misinterpretation. In fact, throughout the early and ensuing generation of reconstructionists pervasive criticism

was directed against the movement by the child-centered faction, which until 1947 had been the dominant group within the Progressive Education Association, and from conservative theorists and liberal apologists in the educational community and wider political public. The political and intellectual shift toward a more radical posture in reconstruction coincides with the renaming of the original association to the American Education Fellowship. The essence of the criticism in each case lay with the role of environmental manipulation might play in the release of creative energies in students and, with the narrowly based conception of citizenship that was akin to the later life adjustment theorists of education. What was common ground to this group of critics was the almost zealous belief that both teachers and schools were not competent, nor morally obliged to challenge the status quo of institutional and political life.

Bowers, in his discussion of the 'middle period 1930-40' of progressive and reconstructionist challenge, senses the ambiguity and uncertain grounds upon which the grand arguments of the moderate and radical or extremist groups were built. He notes, particularly, how the theory of Deweyan pragmatism served, albeit invalidly, to justify a host of implausible prescriptions for educational practice. Dewey himself appears to have struggled with the ambivalence of strategies for social reform and organizational re-arrangement suggested by his position. Bowers illustrates the problem of practice inherent in 'experimentalist' theory by citing Dewey in The Educational Frontier:

The philosophy of education must discover and ally itself with the social forces which promote educational aims, as well as uncover and oppose the vested interests which nullify and reduce them to mere flourishes or to phrases on paper.

Further on he admonishes:

Admit that education is concerned with the development of individual potentialities and you are committed to the conclusion that education cannot be neutral and indifferent as to the kind of social organization which exists...education must operate in view of a deliberately preferred social order.

(The Educational Frontier, 1933,
p. 38, 291)

The significance of this ambiguity with the idea of practice lies in its suggestion that, if legal, economic and political conditions are such as to deny the learner and teacher the development of individual capacities, in the general state, the social conditions should be overturned structurally by the teacher and by implication the schools. As Bowers suggests then, there is an appreciable difference in practice between this position and that enunciated by Counts in the article "A Call to the Teachers of the Nation". If this point is granted then the historical importance of the reconstructionist lineage for educational practice and social change cannot be overlooked given the effect other elements of the experimentalist framework have had upon classroom organization, pedagogy and curriculum. I speculate that because the full theoretic significance of the pragmatist epistemology has not been drawn and developed at an institutional level,

the history of recent reform efforts in social studies education, for instance, amount to a status of 'no significant difference'. Equally, if I adopt a qualitatively different epistemology, theory of education, and theory of social relations, I will be obliged to debate or assess the worth of the scientific tradition that grounds reconstructionism in social studies. By way of whether the 'experimentalist' mode, even if fully incorporated into school practice, could ever empirically achieve its political-educational goals of a renewed, dynamic form of critical citizenship. Arguably, given the political and educational importance of the issues and outcomes debated within and around reconstructionism, and coupled with the semantic and epistemic confusions of their public manifestations, the critical educator cannot overlook a rigorous analysis of contemporary exemplars in the social studies aimed at their conceptual consistency and possibilities of implementation.

By the mid 1930's sufficient 'ideological uncertainty' had crept into the Progressive Education Association so as to feed each of the constituent schisms, yet not allow any form of unified position on the role of the school in social reform nor for a total re-organization of the public school curriculum. Such divisions had led to a kind of intellectual status in the organization that paralleled Dewey's classic abhorrence of the split between theory and action. By 1935 some evidence (Cremin, 1961) indicates that the curriculum reform question was one which could unite the different groups in

some kind of ideological rapprochement. That is, some form of merger between Count's orientation towards radical social reform and V.T. Thayer's orientation towards curriculum reform was possible. The galvanizing concept for these groups was that of schools for democracy - a notion that overrode many of the ideological gaps paralyzing the linked P.E.A. to this time. Embedded within this idea were implications for social policy, for methodological and curricular revisions and for a philosophical underpinning. Smith, Stanley and later, Shores (of Fundamentals of Curriculum Development, 1950, fame) presented the idea of "participatory democracy" which could incorporate within it the notion of an organic community of co-operative relationships, strategies of group communication, "democratic deliberation", qualitatively distinct social studies courses in high school civics, (Ruggas an instance) and the embellishment of 'democracy' "as elements of an inclusive rationale for social reform" (Graham, 1967). Whereas such justification as was generated for these individual pedagogical elements in the early progressivist period rested on ad hoc reasoning usually reduced to the individual child the mid - and later periods, when the radical reformists achieved hegemony, saw a coalescence of philosophy, policy and methodology justified by reference to the concept of "social democracy". It was but only a short step to the idea of co-operative group 'projects' which would take social education beyond the boundaries of the classroom, in the service of democratic reform in the wider world. 3

In 1938 a P.E.A. resolutions committee recognized this professional convergence (or compromise). The committee laid a basis for realizing these schools of a democratic order, borne of a period of economic and political dislocation, by noting that school reform must work:

...for those learning experiences effective in developing insight, attitude, and skills essential to directing the evolution of our democratic culture.

(Report of the Resolutions Committee,
in Graham (1967) p. 80)

Graham summarizes the specific directions the P.E.A. felt it should recommend to achieve their social policy ideal. This included support for research on 'democratic values' methods, new formats for teacher-training, alliances with other organizations supporting 'welfarist' programs instrumental for social change, the denouncement of emergent political authoritarianism, - a project incorporating the idea of the "basic unity of mankind". (Graham, 1967,)

Whether conceptually I can derive all of these, somewhat vague, programmatic tenets from the philosophical base of reconstructionism, is debatable. It is clear that the rather more radical elements do become evident with these proposals. I also ask what it is within the historical profile (beyond a subjective attachment to a new social order) of the reconstructionist philosophy that would allow commonality between social educators of the 1930's and those of the 1970's who are considered to be engaging in a socially

critical form of teaching and learning? Additionally, I ask, as previously, whether these metascientific questions and epistemic forms embedded in the philosophy are capable of generating a critical social practice that stems from the classroom? (The latter question I will deal with more extensively and with greater programmatic focus in a later section). For the moment it may be useful to elaborate partially on some of the features of method that are taken to be common to reconstructionist Social Education and to the "New Social Studies." The latter I characterize as the new wave mentality associated with the Brunerian and Fenton programs of the 1960's (Fenton, 1967; Lawton and Dufour, 1973)

Historically, the pragmatist-reconstructionist principles, such as can be identified, have a number of implications for the curriculum:

1. Knowledge is construed as a means for improving upon personal and collective experience as opposed to its classic formulation as an intrinsically valuable end. Equivalently stated, the generation of theory is inseparable from the practical uses to which it is put.
2. An active, reflective image of sociality is implied in a theory of learning whose essence is self-directed, intelligent and consequential decision-taking. This is in contrast to the passive determined, asocial image of man implied by faculty psychology or behaviouristic regimens of learning and development. That is,

the former recognizes the authentic possibilities for transcendence of experience and the redundancy of earlier psychology theory.

3. A related feature of this method is a conception of the individual or classroom student as having, in principle, control over the structuring of pedagogical and social events and of the capacity to be reflective over the possible outcomes of personal and collective acts - beyond those prescribed in the contrived rationality of decision-making situations of conventional instruction theory based in cognitive or behaviorist psychology traditions.
4. Experimentalist method conceives of the inseparability of intellect or reason from one's subjectively emotional states. This position contrasts strongly with the endemic separation of cognitive and affective schedules in teaching and learning arrangements.
5. i) Such a form of method has a conception of curriculum that inextricably relates school knowledge to 'everyday knowledge'.
 ii) A corollary to this is the grounding of all school and curricular practice in the notion of desired social order and lifestyle.

(Through this method and quasi-epistemology the validity and meaning of an (educational) proposition or representation (curricular) is 'tested' against the success of its intended implementation or action).

6. That concept of "democratic deliberation" in use during the later reconstructionist period is paralleled by the

concept of 'discursive publics' wherein social knowledge is penetrated through a group assembly in which each participant, politically and psychologically unhindered, seeks to achieve a state of 'uncoerced consensus' with the other; the intent lying behind this being that of truth, justice and equality in communication and in social life. The argument, then, is that political, legal and social arrangements at the institutional level interpenetrate with one another at the level of group publics and of self-formation. Such structured arrangements, then, clearly have a bearing upon the outcome of authentic dialogue or uncoerced, deliberate communication.

7. The notion of truth operative in this tradition relies, in part, upon an achieved consensus in an uncoerced, critically-skillful public. That is, the validity of, say, curricular representations of salient social realities is true to the extent that an uncoerced agreement is reached by a majority of affected participants.

(Note that this conception of truth conditions seems to have been widely misinterpreted by curricular theorists and social educators in the reconstructionist period and during the recent revival of critical citizenship programs in the 1960's and 1970's. Its most obvious danger lies in not recognizing the historically mediated quality of ideas by dominant institutional infra-structures such as the economy. This could lead, in effect, to a total technical-conditionedness of many symbolic-conceptual systems by outmoded, historically-

redundant forms of life from earlier societal eras.

A person in a very real sense cannot be 'critically' reflective or even 'reconstructive' if this awareness is absent from teaching and learning. Put quite simply, the pragmatist reliance on 'the scientific method' must take note of its specific origins in a definite historic space and time. There is precedent for the misuses of an over-developed voluntarism in method particularly as Bower (1969) demonstrates with reference to the application of group discussion method in social problem resolution. He discusses the striking functionalist parallels that emerge from the radical extremist Brameld's curricular experiments and that of the later life-adjustment movement of the period 1945-1955 (containing such educators as Alice Miel, 1952, and Florence Stratemeyer, 1957). Clearly, the curricular intents of this later group of developers did not coincide politically or programatically with the radical reconstructionists, yet it is conceivable that a pervasive un-critical faith which associates the scientific method with a vision of the democratic order played a significant role in ideologically and practically neutralizing the intents of the later reconstructionists. I refer to the period 1944-1955 under the aegis of the American Educational Fellowship and the revitalized P.E.A. (See C.A. Bowers, 1969 and appendix VI for a more extensive profile.)

Of direct interest is how the contemporary Harvard Public Issues Program of Oliver and Shaver (1966) and their jurisprudential model of classroom learning, the "New Social Studies" advocates such as Fenton (1969, Massialas (1967) and

Hunt and Metcalf (1969) show almost boundless faith yet historical 'amnesia' in the uncritical adoption of notions of neutral, open-ended epistemologies of inquiry as a modern reconstructionist position.

The nature of the dilemma for those engaged in curriculum criticism is to determine to what extent certain elements of the experimentalist philosophy are necessary, but insufficient conditions for their capacity to realize critical reformist ends. My view is that these experimentalist ideas are hopelessly overdetermined with respect to their capacity to achieve educationally-inspired political change. Moreover, the experimentalist bias limits speculation on the nature of those epistemic features that could be synthesized in a form of inquiry congruent with the history of radical reconstructionist aims.

Some examples of pedagogical elements that were developed in the later reconstructionist period for the classroom teacher intent on "transforming the classroom into a center of direct social action" appeared in 1948 and which consequently became 'official' policy for the American Education Fellowship. The article entitled, "A New Policy for a New Times", (Progressive Education 25 :4, 1948) listed sixteen methodological elements.

Of the eight that Bowers reproduces at least three or four of the elements, according to my experiences, are likely to be found as content features of the vast majority

of secondary social studies programs in the ten major educational jurisdictions in Canada (and presumably the United States). At least two of the elements have been adopted as innovative components of social studies and humanities programs in secondary schools or at least received the blessing of officially sanctioned rhetoric at the diffusion stage of program development in Alberta in the late 1970's. Notably, two other components have been associated with progressivist reforms and open classroom experiments in elementary schools across the country on a mass scale in the U.K. A final element has achieved special program status for intellectually gifted students in a handful of high schools in urban centres in Canada. The table/chart appearing in appendix II suggests a number of alternative interpretations as to the political and educational fate of these once-coveted reconstructionist tenets of method and content.

Several different directions of interpretation seem warranted.

One could argue the position that those reform measures have been successfully 'incorporated' in the orthodoxy of schooling arrangements and conceivably neutralized; or that the adoption of these pedagogical elements, in as pure a translation from the progressive tradition as is institutionally practical, has led practitioners to the conclusion that the theoretical premises of these innovations have not been vindicated in practice; or thirdly that 'ad hocery' in school experimentation destroys the essential unity or gestalt of the reconstructionist tenets. That is, anything less than full scale adoption of all proposals at a school-wide level is bound

for failure or will lead to negligible differences in instructional outcomes.

It is interesting to note which of these earlier reconstructionist proposals of classroom method are taken, by contemporary proponents of reconstructionist doctrine, in the social studies (Newmann and Oliver, 1967; Oliver, 1976; Newmann, 1975), to be congruent with their own conceptions of methodological designs for communitarian and citizen action programs or conversely which proposals are taken to be repressive features of method. In identifying the above mentioned social educators as at least partial reincarnations of the 1935-45 reconstructionist period in its moderate and radical expressions, I will argue that current day public issues educators will show some receptivity to the forms of teaching and learning advocates for a critical citizenry proposed over 30 years ago. Recognizing this association also compels the astute observer to note that these very educational forms have been institutionalized to a large extent - albeit under varying organizational conditions in many elementary and secondary schools in North America. The impressionistic evidence suggests that few radical educational outcomes of the type envisaged thirty years ago have come to pass despite the recent process of institutional incorporation of counter cultural forms of the 1960's.

The preceding thoughts are a means of raising a warning about the uncritical acceptance of models of educational innovation for radical ends at face value. If I am committed to a radical educational practice, I am obliged to examine, through a form of critical analysis,

once again, the conceptual and methodological parameters in which political socialization and citizen action programs are situated so that contradictions in theory and practice may be overcome and re-synthesized to a higher unity.

In this study it is not my intention to develop any of the subsidiary questions surrounding the obstacles to organizational adoption of these innovative arrangements nor to elaborate upon the motives or possible recalcitrance that practitioners exhibit, through the logic of their actions, to radical reform projects. A more modest intent of this research is to begin to raise questions through conceptual analysis of the structural adequacy of inquiry models displayed by latter-day reconstructionists in their quest for a renewed democratic order - as grounded in the teaching and learning arrangements and dialogue patterns of a critically-reflective citizenry. To this end, then, I am merely turning the method of social criticism exemplified by the tradition of Dewey, Beard and Counts back upon itself.

As I proceed gradually to the next section where more contemporary illustrations of reconstructionism in the social studies are discussed, I will insert at this juncture a concluding yet transitional section that considers the form that some social reconstructionist thinking has assumed in Canadian education over the past decade. As a concluding point I will note some of the recurrent ethical and political features common to this tradition in Canada and North America as a whole.

Reconstructionism in the 1930's has shown itself to be a complex social, political and educational movement. At one point in its history, it was primarily articulated as a social and political policy that educators felt they had a responsibility to formulate. At another point in the career of the movement, reconstructionism was more coherently expressed as a set of school-centred goals regarding the restructuring of liberal democracy. As the movement struggled for legitimacy and professional survival, a series of confrontations between moderates and extremists gave it expression through designs for curriculum and instruction at the level of classroom activity. As an educational philosophy, its association with a discipline or subject area has never been historically or theoretically explicit. There has been, however, some agreement among practitioners and observers of the movement that the social sciences and hence social studies are the most fertile pedagogical base from which to give institutional meaning and organization to the movement at a school level. Certainly, 'curriculum developers' such as Harold Rugg, Theodore Brameld, Charles Beard, and more recently the Harvard School of social education, confirm the closeness of conceptual and political association of pedagogical social science with the development of a critically-minded citizenry. But the links between a discipline base, its practice and a social-educational movement have not been thoroughly explored or justified. Indeed, the assumption that reconstructionism should be identified

with a solitary base or discipline cluster could well violate the inter-disciplinary unity of purpose and interest that Dewey, Brameld and others sought for the movement. If the distinction between the terms 'field' and 'movement' has any significance for educational practice, then other discipline areas can be expected to make an integral contribution to reconstructionist curriculum designs. Historically, however, it has been social education rather than any other teaching area that has taken up the reins of reconstructionism and driven it through a variety of pedagogical forms - not, it must be said, without a historical legacy of accompanying contradictions and ambiguities in definitions, contents, strategies and outcomes.

This uncertainty is paralleled at a more general level with the difficulty theorists and practitioners have in coming to grips with the meaning of the term, curriculum. Does the term connote teaching acts, instructional styles, all the experiences undergone by a child in school; or does it suggest the strict specification of all 'intended learning outcomes'? Such a problematic is significant not only for curriculum and social education researchers, but also for classroom practitioners. I see chronic uncertainty in the discourse and deliberation of curriculum and the social studies, and with the epistemic and philosophical assumptions underpinning different forms of curriculum classroom practice. Curriculum development in the social studies is likely to revert to a series of technical and managerial decisions -

rather than as a critically-reflective enterprise engaged in by developers and teachers. That is, forms of curriculum discourse and design congruent with a reconstructionist social studies are likely to be thwarted institutionally by the 'expert' prescriptions of content method and intent of an educational bureaucracy reliant upon 'top-down' patterns of curriculum decision-making.

G. Milburn (1977) suggests that to begin to clarify the practical and conceptual ambiguities of curriculum talk and its implication for social practice, we are faced with either adopting the 'conceptual analytic' device of logical stipulation that would indicate what curriculum ought to refer to and what would be excluded as educational referents from the term, or we can examine the various forms of what are taken to be curriculum practice in Canadian schools. I will adopt the latter option as fruitful for unearthing the operative assumptions and principles regarding current curricular structures and arrangements that are practised in particular social contexts. To opt for this approach does not suggest that practitioners or theorists are necessarily fully cognizant of these assumptions implicit in their work. In this study I refer to conceptions of curriculum because, firstly, it is not appropriate at the level of practice to separate out forms of organization and transmission, such as curricular designs, from the manifest contents and intents of social studies programs (reconstructionist or otherwise). Secondly, as Berlak (in Shaver, 1977a) reminds us, and as will be elaborated upon in a later section:

...curriculum theory that deals with a particular area of the school program (read reconstructionist social studies) is obviously only a piece of a broader curricular theory, and a curricular theory is only one aspect of a theory of schooling and society.

(Berlak, in Shaver, 1977a, p.46)

If I have successfully argued a need to reconsider the interpenetration of curricular and social education program elements, then we are in a position to investigate curriculum development-in-social studies education as a socio-political and ethical process of reproduction regardless of the particular orientation to which a person or school adheres.

TRACES IN CANADA

Milburn (1977) identifies three operative orientations in current Canadian school practice. Over a period of fifteen years educators have recognized and implemented forms of practice that could be labelled 'curriculum-as-disciplined study' (grounded theoretically in the forms of knowledge thesis of Hirst, Peters, Phenix and Bruner) in which program contents are primarily mediated by the structure and principles of academic disciplines; 'curriculum-as-humanistic child-centredness' in which formal program contents are organized for intents such as 'self-actualization' and creative wholistic development of the child. (This set of practices was particularly popular in the period 1968-1973 and involved the dissolution of many traditional institutional barriers such as norm-referenced evaluation and highly structured course sequencing. Exponents of this movement included Carl Rogers, Abraham Maslow, Hall-Dennis in Ontario

and such lay critics as John Holt and Everett Reimer). The third orientation 'curriculum-as-social reform' overlapped in time with the second. Of more concern for this study are social reformist curricula that carried the assumption that schools noting the parallel with the 1930's thought, "ought to give shape to a changed and better society" (Milburn, 1977). In his description of some of the features of this orientation, Milburn makes an implicit connection with social studies teaching in Canada. Schools that were charged, or seemed to be charged by some provincial administrators, with the task of easing intercultural tension in the Canadian mosaic, with developing increased affective tolerance for diverse political and ethnic groups, with generating within students a sense of global responsibility and interdependence in the world community or with simply portraying Canadian social history in a more comprehensive fashion relied upon curricular materials framed with reference to sociological, historical and geographical parameters. Values classification procedures, Canadian Studies materials, man-in-society courses, community-oriented programs, propaganda-bias detection skills have each been operationalized, if unsystematically, in many secondary social studies programs. A number of practitioners of community-oriented program designs have implicated teachers and students in confrontation encounters over both educational and governmental policy. Considerable range and degree of dissent has been reflected in programs that could be categorized as social reformist—some of which are easily tolerated by school and community representatives. Others, such as the Quebec Teachers' Corpor-

ation 1975 manual for teachers and students, suggested that working-class principles should be codified as school knowledge designed for emancipatory learning and the social criticism of narrow conservative economism. (The qualitative range of exponents of this position of active, community-based learning include Hodgetts (1968; 1980); Milburn (1976); Martell (1980); C.O.R.E. program based on the Philadelphia Parkway Program in the Edmonton Public System (1972-77); the C.E.Q. May 1st Manual (1975); Pratt (1973); Shor (1980) and Berlak (1981).) The preceding figures anchor this particular pedagogical tradition within political frameworks that range from conservative nationalism to liberal pluralism, to feminist world socialism respectively.

Despite considerable variation in the political and civic intents of these programs, each is motivated by the notion of a changed social structure, and idealized society and the inclusion of pedagogical strategies (whether in-class or community-based) that attempt to "raise" student consciousness through an explicit political-educational commitment. In each case, in the programs and conceptualizations cited there is agreement that social studies programs should achieve a core status in the school syllabus, that curricular contents are 'problem-centred' (in the sense of pressing everyday life concerns and social inequities of condition and opportunity) and that disciplinary forms of knowledge are subsidiary to the educational experience. Formal knowledge is useful to the extent that it confirms the 'correctness' of a strategy of action, enhancing the interpretation and clarification of a lifeworld problem. It should be noted that social science concepts and research techniques are borrowed heavily for use in classroom problem-solving.

A salient consideration that cuts across all three general curricular orientations and what is raised by not only Milburn, but by Shaver and Larkins (1973), Kehoe (1974), Berlak (in Shaver, 1977a) and others is the essentially unreflective nature of research, theorizing and implementation activities associated with social studies education. This point is usually made in the form of a methodological and conceptual criticism (accompanied by a recommendation that the deficiency be remedied in practice) that researchers and teachers lack a clearly established theoretical consciousness or recognition of the philosophical and epistemological assumptions that undergird the models, strategies or materials with which they work. If the omissions, in point of fact, are as widespread as the critics suggest, educational practice is conceivably compromised on two fronts. Those individuals involved in curriculum design work or policy decision-making are pre-disposed to committing mismatches of means and ends when the clarity with which they understand operational models is obscured. This kind of error leads to the classical case of decision-makers talking past one another and investing models and constructs with properties and powers they do not possess. Such naivete about the theoretic assumptions and intents that inform programs can lead to reactionary and defensive postures on the part of teachers who see themselves as strangers to innovation and curricular reform unable to debate authentically or justify thoroughly to themselves or to relevant publics the rationales, virtues or

drawbacks of programs they engage in. Classroom practice in the way of curricular reform; then, is transformed into an exercise in technical management. Secondly, I can expect those who are not cognizant of the organizing assumptions to be equally ignorant of the socio-political implications of the teaching and learning arrangements they seek to maintain. Considering that curriculum theory, in social education in particular, provides a particular representation of the nature of social reality and of the nature of participants' knowledge, the implications for a reconstructionist social studies are immense. Real and inherent possibilities emerge for the distortion or supervision of educational and political problems within a reconstructionist curriculum. It is clear, (Brameld, 1965), that simply because educators demonstrate on a priori reformist zeal in their policies for programs, does not guarantee a selection of congruent strategies in the translation of theory to practice. Given the ideological nature of advanced industrial society, the expectation that alternative symbolic systems are easily generated or operationalized is often times a rather vain idealistic outlook.

THE HARVARD SCHOOL

In depicting the need for alternative conceptions of social studies research or in the search for optimal strategies to realize critical reformist programs, writers such as Berlak (in Shaver, 1977a) and Shaver (1973a, 1977) stress the key words such as reflectiveness and deliberation as methodo-

logical tools that can be coupled with organizational changes. They intend to encourage thought about basic premises, predominant modes of inquiry, socio-historical contexts and the political-ethical choices involved in planning, design or instructional levels.

Arguing along more substantive lines Kehoe (1974) indicates that prior to the emergence of the "New Social Studies" (that is, the physical science inquiry format of pedagogy) program intents and contents, at least in North America, took for granted as self-evident the intrinsic worth of values such as 'freedom, equality, rule of law' and other precepts of an advanced liberal democracy. In the mid 1960's with the introduction of pluralistic conceptions of teaching and learning, paralleling the dominant political metaphor in the larger society, positivist inclinations emphasised the generation and verification of knowledge-as-fact unadulterated by the separation of values from objective representations. Accompanying this break with traditional dogmatic forms of teaching and learning was a reconstructed role for the school. As an institution, serving, in good faith, the wider social interests of the society, procedural and behavioural values were to be promoted as content for social studies instruction. Emphasis on mastery of inquiry procedures and democratic decorum in the classroom would dissolve the unexamined dogmatism of future citizens destined for a life in pluralist democratic order. In this setting rational inquiry would disclose the objective structures of the physical and social world yet would allow the separate but free play of

peting value-preferences of culturally heterogenous lifestyles. Kehoe's work shows by implication that through distancing oneself, conceptually, from the proposed curricular models for citizenship education, a person not only raises questions of internal technical validity, but lays bare the obscured value position of pluralism as a desired end state. Additionally, we begin to lay bare how any forms of inquiry and program rationales are predicated upon a moral and ultimately political commitment to some arrangement of social relations in the world at large. Oliver (1957) and Newmann (1963) demonstrate a grudging awareness of this issue. Program developers of content for 'public issues' analyses, such as Newmann and Oliver (1970), suggest that the only defensible goal for a socially responsible social studies is the development of

...an explicit concept of citizenship education....

(Newmann, 1963, p. 404)

and one that sets the enhancement of individual dignity in a societal context. Elaboration of rationales and curricular end-points, whether inculcation of decision-making skills for responsible citizenship or more structurally-reformist goals, imply the importance of 'rationale building, if curricular change is to materialize in students' consciousness or in changed social relationships. Whether social educators beg to differ on the conceptions and imperatives of their instructional programs, it makes historical sense that in building programs for pluralism, the development of rationality, or radical social change, that these persons

not ignore the dominant value complexes of a wider ideology that are continually and tacitly re-affirmed in intellectual inquiry, in school life and community life. The 1966 Public Issues Program of Oliver and Shaver sought, as an integral aspect of its classroom 'face', to depict controversy and confrontation in social life as an inescapable element of achieving a stable consensus in a pluralist, liberal democracy. Clearly the point here is not whether Oliver and Shaver are accurate in representing the structural conditions of North American society as pluralist nor whether their pedagogical measures would generate responsible, effective citizenry, but that they have accepted the axioms of a deliberative rationality, one that is essential for developing and realizing the beginnings of a reconstructionist social studies. The empirical accuracy of their curricular images of North America as a liberal democracy is taken up later in the study.

In concluding this chapter, I want briefly to delineate a number of attributes of an ethical and political nature that would seem to characterize what I will take to be contemporary reconstructionist strands in social education. At this point, it may be useful to frame this ensuing discussion in terms of some relevant dimensions common to the vocabulary of social studies practitioners.

The following list comprises a systematic selection of ethical and political intents and recommendations distilled from particular social educators and seen by them as integral to a renewed conception of citizenship education for students in a complex industrial society. My intention here is to pro-

vide an impressionistic profile of features that can plausibly be termed 'reconstructionist' in orientation. These features follow no particular order of significance or classification and conceivably have implications for different orders of educational policy, program development, classroom practice, individual consciousness and macro-social practice.

- i) Orthodox social studies has given little consideration to the everyday requirements of or the measuring of citizenship education. Citizenship here can be taken as including a moment of creative resistance in an array of civic skills.
- ii) Research and development in social studies has been marked with a failure to deal with questions of "intellectual significance" or "pressing human needs".
- iii) Research projects and research project decision-making are ethical choices requiring moral justification with each step taken.
- iv) Renewed practice of social studies must consider the meaning of tests of social significance as opposed to the false dichotomizing associated with spurious scientific 'objectivism'.
- v) Renewed civic education deals rationally with major issues facing society in which material is presented to students that is more useful in allowing re-construction of their social and psychological realities.

- vi) Teaching and learning theories, as elements of a comprehensive rationale, cannot be seen apart from the context of social arrangements.
- vii) It is important to recognize the effects of institutional conditioning upon the legitimacy and plausibility of programs that generate skill in the political-decision-making process.
- viii) Research in social education must also be sensitive to 'teasing out' complicated (political) relationships.
- ix) It is significant to consider the probabilities of persons becoming competent critics of society despite the citizenship education approach adopted.
- x) Do teachers, as part of a larger program philosophy, encourage/discourage students to examine the relationships of socio-political economic arrangements, past and present, to the ways of people's everyday lives?
- xi) Schooling is to partially contribute to change by helping the young become more self-reflective and competent in questioning the adequacy of extant societal responses to changing conditions of social and political life.
- xii) It is assumed that experience, whether school experience or not, can alter the ways in which a person views the world.

- xiii) With increased awareness and consciousness of the forces operative on them and within them, students are capable of seeing the world differently and hence may be capable of acting differently.
- xiv) Simplistic arguments prevail in most statements of rationale or objectives; that is, the "of course" postulate or weltanschauung of ordinary language philosophy and its lay derivatives.
- xv) That the "structures" of academic disciplines are politically-neutral, organized bodies of substantive and methodological knowledge is patently false.
- xvi) It is the developing political consciousness of the individual teacher that is central to any change in teacher's (renewed) orientation to civic education. (Materials development or implementation models by themselves have negligible impact).
- xvii) It is important that teachers are exposed to the issue of continuity and change in social life.
- xviii) The primary aim of political education (read civic education) is to raise consciousness as a contribution toward political action.
- xix) A secondary aim of civic education is to examine and explore alternatives through skills and knowledge that permit past/present examination of the

consequences of political, productive and family relationships for social problems.

xx) The adequacy of one's curriculum work resides in the effort to relate theory to practice and practice to theory.

xxi) The curriculum efforts of politically conscious teachers, administrators and curriculum designers contribute to an enlightened civic education.

xxii) Civic education represents a continuing struggle to renew our social, political and economic institutions.

xxiii) Rationale-building involves a clarification of beliefs about what the world has been, is, can be and should be like.

xxiv) Critical analysis of the assumptions and implications of proposed values or ethical education programs is an essential part of rationale-building for citizenship education.

xxv) It is important to consider the (precise) role of social studies in encouraging social criticism.

Clearly, many competing conceptions of civic education exist. I am less certain that there are many competing conceptions of reform-minded social studies that show some practical affinity with radical progressive legacies from the past.

It seems warranted to conclude, after an impressionistic kind of content analysis, that the preceding features are basically congruent with the tenets of the 'reconstructionist' tradition. These ideal typical features were adapted from

the exemplary work of Shaver and Larkins (1973), Newmann
(1977), Berlak (in Shaver, 1977a), Shaver (1977), Berlak
(1981), Gleeson and Whitty (1976).

Footnotes

1. The work of Theodore Brameld in North American educational philosophy has generally not entered the public consciousness from the major debates within educational progressivism. In the early years of the decade 1930, at the depths of the depression, there was virtual unanimity amongst liberal progressives and radical reconstructionists that education was to promote social planning and the public ownership of means of production. This unanimity was achieved temporarily because of the liberal faction that turned slightly dirigiste during this time. Amongst its more notable spokespersons were George Counts, Harold Rugg, and John Childs. Within ten to fifteen years these men were to do a volte-face ideologically and spurn the social radicalism of Brameld, Hook, Grossman, Edel and others.

The radical reconstructionists, in order to maintain some integrity and community with their distinct social-political orientations, found it necessary to inaugurate a journal, *The Social Frontier*, in 1933. Up to this time the radical faction, of what was seen as the progressive movement, had had great difficulty making its view public through the regular journal of the P.E.A., *Progressive Education*. It was in the pages of *The Social Frontier* that Theodore Brameld began to write stridently in 1935 with an essay entitled, "Karl Marx and the American Teacher." With the formation of new journals by both the liberal and radical factions at mid-decade, the split between each faction was sealed. What became a mottled career of controversy, was to last over ten years.

By 1947 the liberal and conservative elements of progressivism capitulated the leadership of the P.E.A., which was renamed the American Education Fellowship, to the radical faction. The latter group composed of theorists such as Raup, Benne, Axtelle, Stanley and Brameld. During this time the A.E.F. developed a policy chiefly orchestrated by Brameld which reflected in its contents a resurgence of 1930's reconstructionist radicalism. This policy included political position statements, methodological, and curricular prescriptions designed as a bulkhead against a declining ideal of world civilization. Some of the principles involved the broader goals of world government

and order, and a socialized economy. Some of the curricular goals of the policy were the development of consciousness in students, teachers and citizens on the meaning, and values governing new social arrangements; the integration of subjects and detailed social designs for personal, family and civic living; and interdisciplinary inquiry that emphasized the social implications of science and the significance of community planning. Its methodological goals included establishing democratic discipline norms, anti-individualism and socially organic thinking in the classroom, and the development of 'realistic' program materials that aided students in detecting propaganda. (See appendix II for a fuller representation of the policy principles). Earlier, moderate reconstructionists such as Counts, Childs, Rugg and others shied away from this essentially Marxist formulation. These figures were increasingly affected by the growing post-war mood in the United States of nationalism and conservative militarism.

But in the years 1948-51 those individuals who stayed with the radical faction of reconstructionism enjoyed a peak of influence. By 1951 opposition to the principles of the A.E.F. policy statement re-surfaced. Almost singly, Brameld struggled to retain them. By 1955 social reconstructionism, and the renamed P.E.A. began losing their political and philosophical purity once again. Life adjustment education was a parallel movement that emerged out of the irresolute persons of the liberal and quasi-radical factions. Its focus as a movement was on 'problems of practical living': the necessity for constant psychological readiness for change. Hence the use of social engineering techniques became part of the life adjustment curriculum of reconstructionism, circa 1955. As Bowers (1969, p. 246) puts it 'politics and education were fused once again' but on this occasion individual socialization in the schools was directed by state needs rather than by the universals of humanization.

By the end of the decade 1950 and for the next ten years it is only Theodore Brameld (1965, 1971, 1973) and the philosopher Issac Berkson (1958) who were left as a strident, critical coterie that was in a direct political and intellectual lineage with radical social reconstructionism.

with its ultimate roots in the Marxist tradition. In the 'progressive' radicalization of his philosophy Brameld distances himself from the progressivist legacy. Dewey's contribution is cut as early as 1950 and by 1961 (Education for the Emerging Age) not only is the early George Counts the only acceptable progressivist, but that the entire movement is taken, by Brameld, to be a transitional one that has neglected the real historical trajectory of the world to socialism. Brameld is supportive of some of the social consensus work of his former colleagues Axtelle, Benne, and Raup but essentially he builds originally from his own philosophical schemata. The school's tasks are re-emphasized toward building a world civilization, or global socialist community. Classroom life must stress notions of group mind, collective social experiments, the creative use of propaganda and myth-building; that is, the direct advocacy of cultural-political indoctrination and imposition in teaching and learning relations for a socialist future.

In the 1960's Brameld periodized American society and its shifts in educational provision. He identified the 'emerging age' as highly technicized, automated, with world population at zero growth. The economy would emerge as truly global, publicly planned, with resources based on social need. International or global government would be democratically regulated. Brameld seems to argue for a systematic inculcation of world order norms and global consciousness that could not be conveyed by methods of liberal experimentation and social inquiry.

Experimental method as a teaching and learning form, for Brameld, was a dominant tactic used to paralyze the organization of a common world community based on revealed public interests. In fact, it only bred "cultural illiteracy" amongst young men and women. Significantly, Brameld provides a tacit critique of the public issues - deliberative democracy tradition of social education. Rational argument and persuasion, as a pedagogical device, is seen as insufficient in itself to sway students to embrace and develop alternative (socialist) personal and social futures. Democratic deliberation, according to Brameld, acts in capitalist society as an internal holding device for social relations of inequality and exploitation. The

former provides an illusory sense of participatory decision-making. It fails to convince students and citizens through the force of a better argument that collectivist social arrangements are a preferred form of living. Hence, the creative or hortatory power of myth, persuasion, and indoctrination are necessary, preliminary devices to bring students and citizens to the edge of socialist consciousness. This means, too, for Brameld that they will come to accept the inevitability of class struggle and social transformation. Past this historical-political threshold social experience will build in citizens the convictions of the social justice of collectivism over capitalism. Myth-building and propaganda, for Brameld, become important devices for shifting student and citizen consciousness in the same way as capitalist ideology has operated for one hundred fifty years.

Towards the end of the decade, 1960, Brameld was severely isolated in his collectivist but doctrinaire methods and philosophy of social reconstructionism. It is arguable whether his philosophy could ever become a praxis of students intent on securing their own autonomy and responsibility in the increasingly corporatist life forms of capitalism. Of all the social theorists that come closest to Brameld's analyses of domination and resistance, of that time, is Herbert Marcuse. Each saw a certain urgency for subordinate social classes to embrace universal and transcendent social, libidinous and psychic forms. Marcuse's work on libido and social organization (1955), and the desiccation of consciousness in the modern age (1964) complement the irrationalist plunge to a new world order of Brameld.

For Marcuse (1955, 1964) as Brameld (1965, 1973) citizens, teachers, and students not only had to accept a new world view that contained the processes of class struggle, and transitional dictatorship in the new social order but they also had to be concerned with method. That is, they could not simply anticipate the passage of capitalist society as a contemplative act or as an inevitable historical outcome. They had to actively contribute through social action to the transformation of that society. For Brameld method involved the inculcation in students and citizens "... of a point of view consonant with the requirements on the new America" (Brameld, *The Social Frontier*, 2:4, p. 55).

He also urged teachers to embody the moral issues involved in oppositions to capitalism with a call to civil disobedience, against its institutions if necessary. For instance,

Marx almost admits that successful insurrection against the capitalist class is the highest moral act possible in our society.

(Brameld, *The Social Frontier*,
2:4, p. 55)

As a third aspect of method, Brameld argues that teachers need to acquire "class consciousness" in the sense of their recognition of solidarity with other workers that included reporters, engineers, factory workers and ditch diggers. To recognize one's true "economic status" is a primary determination in choosing effectively the social outcomes of one's life. Herbert Marcuse's politics of negation, refusal, and transcendence, of the 1950's and 1960's, in my estimation show tacit but strong methodological parallels.

CHAPTER 5

LIBERAL DEMOCRACY AND SOCIAL STUDIES EDUCATION

In order to engage in any critical analysis in the field of social studies reconstructionism, it is necessary, in the interests of interpretive inquiry in the social sciences, to present a brief, descriptive historical background of developments in secondary school social studies relevant to contemporary curriculum materials.

This section of the chapter examines key elements of educational policy and program design envisioned, by predecessors in the field, as salient for developing political consciousness and civic competence in future citizens living in liberal-democratic, complex society. To this end, my focus will be on features highlighting the Public Issues Program for secondary social studies (1966), the associated conception and practice of Jurisprudential Teaching and the "Community and Education" theme variants, of the period 1967-1977, that were initially spawned, it could be argued, with the development of the Harvard Social Studies Project, by Donald W. Oliver in 1956. This is not to claim that no other schools of thought in social education are illustrations of social reconstructionist tenets but that educational activities receiving most professional attention, in this view, over the last decade in North American schools, cluster around the associates of the Harvard School. Indeed, few

other programmatic proposals have reached the stage of implementation in public school systems.

A loose conceptual schema of analytic categories will be employed to establish, more closely, the educational parameters of these programs and proposals. I will present the outline of a schema that will be used to 'catch' the implications and meaning for educational practice of the work of F. Newmann (Education for Citizen Action, 1975) and that of D.W. Oliver (Education and Community - A Radical Critique of Innovative Schooling, 1976) considered as contemporary exemplars of social reconstructionism.

Critical citizenship education curriculum proposals, whether expressed at the abstract level of conceptual rationales or at the level of actual program design, have characteristics that address three types of relationships within the society-at-large and within the context of instruction in the classroom. These three categories of relationships known as pedagogy, program/content, and evaluation constitute distinct 'message systems' at whatever level of deliberation, and taken as a unity, can be said to constitute a curricular orientation. In this case, I am concerned with social studies programs which, due to their nature, often exhibit an explicit conception of the everyday world of social relationships, and specifications on how the form of these relationships may be altered through concerted change. They also offer conceptions of the nature of relationships generating school knowledge, non-school knowledge and include assumptions about teaching, learning and the develop-

ment of social consciousness amongst students.

I briefly illustrate the work of Fred Newmann (1975, 1977) and Donald Oliver (1976) in terms of the preceding categories as a precursor to a critical-historical analysis of the Harvard School of reconstructionism.

D.W. OLIVER AND THE HARVARD SOCIAL STUDIES PROJECTS, 1956;
THE SELECTION OF CONTENT IN THE SOCIAL STUDIES, 1957.

Consciously following the lineage of social criticism in the social studies first developed through John Dewey and Charles Beard's (A Charter for the Social Sciences), the Harvard Social Studies project came to a first stage of fruition, after a decade of development, in 1966. Charles Beard and Harold Rugg, from the 1920's, were intent on developing a philosophy and objectives for a social studies of social reform that was to serve as a means to "a form of action on the part of some particular social group" enabling it to lead "a positive and creative attack on social problems" in an age of diminishing liberalism (Cremin, 1961, p.23). Beard's primary contribution to the history of pedagogical reform lay in his notion that teachers and students brought to the school an embryonic social theory of the ideal social order which would form the tacit criteria by which they would select content and form responses in the instructional situation. Although the thesis of the social framework of knowing has been elaborated, in one form or another, at least thirty years earlier in the social sciences, it rep-

resented a qualitative leap for educational theorists to plan consciously reformist curriculum with this elementary generalization in mind.

Oliver and associates have followed the intents of Beard whose faith in a secular, rationalist scientific approach to social problems and conflict incorporated notions such as the fundamental exchange of ideas, compromise, and 'democratic deliberation' as instrumental for a state of social harmony in a pluralist polity. Oliver considered that students emerging from secondary schools in the mid 1950's and 1960's were personally and collectively incompetent to generate decisions required of a citizenry in a democratic order. This paralleled an intuition common amongst secondary students that social studies curricula were deficient in social issues content. It was the intention of Donald Oliver and James Shaver to design a secondary social studies program for developing competence in the analysis of controversy and the ability to take defensible positions on social issues. The Citizen Education Project (1956) and later the Public Issues program carried with them an image of the 'ideal society' in which conflicting interest groups and individuals are allowed considerable range of freedom to pursue different lifestyles and standards at the expense of no subsidiary group. The programs stress the 'goodness' of a pluralist social order united by an overarching consensus on certain procedural norms such as rule of law, equality, freedom and respect for others. The model of the ideal

society was centred on the notion of a social community of discourse which was transposed, in turn, to the instructional level. Conflict and its resolution through justifiable stances was to be achieved through discourse, debate and advocacy.

Pedagogically, the model involves making explicit of the lifeworld of students and their perceptions of justifiable modes of conflict resolution. Oliver and Shaver's 1966 approach (Teaching Public Issues in the High School) centres on a process of classroom dialogue and debate. Historical and demographic background of issues is presented to students by the teacher who then demands that personal positions are taken. These are later defended and clarified using modes of reasoning from legal ethical inquiry. The same process is used with each issue presented wherein the interest of students is elicited, attention is turned to the value complexes implied, and the expression of personal preference is exhibited and then justified. Oliver and Shaver describe the 'bare bones' of the process by noting the role of the teacher in

...appealing especially to historical analogies to broaden the content of discussion. The initial questions raised by this material tend to be "should" -type ethical questions, but the class is inevitably thrust into legal, factual, and definitional questions when the student's own views of the "good solution" are compared with other "legitimate" social solutions. It is this amalgamation of law-government, ethics, contemporary, and historical factual questions developed around perennial issues of public policy that we refer to as jurisprudential (or legal-ethical) teaching.

(Oliver, Shaver, 1966, pp. 114-115)

Implicit within this form of pedagogy whose "... central objective is to teach the student to carry on an intelligent dialogue bearing on important public issues" (Oliver, Shaver, 1966) is the development of an argumentative, adversarial climate in the classroom where students ultimately take a position and justify decisions independent of the teacher with peers and significant others, in the formulation of critical political judgments. Conceivably, beyond the realm of analysis and generalization in authentic action. The authors do not elaborate on this point. Clearly, many assumptions are made about learners' cognitive styles, base competencies, and maturity, as well as teachers' willingness to accept negative reactions from the professional community that are unnecessary in programs emphasizing recitative approaches and the 'simple' mastery of social science 'facts'. The latter programs may deny the participation of certain kinds of teachers and learners.

The content of the program design is, essentially, unspecified by Oliver and Shaver who offer a framework for the selection and organization of content. They suggest that teachers use various strategies to generate knowledge. But, short of any systematic framework, issues can be drawn as critical issues "on the contemporary scene" or "topics... least understood" due to their cultural or geographic diversity, or those which can be most competently presented by the teacher. It should be noted that latitude in scope and sequence for controversy selection is designed to elicit

any emotional commitment within students to interiorize the role of the other. There are implicit boundaries on the nature of the content and manner of its selection. Above all else, it is teacher-centric to the extent that students have little scope to confer final pedagogical legitimacy on most classroom activities.

The Harvard Public Issues program by and large concentrates on orthodox forms of evaluation. The essential preoccupation with the program lies with assessing the degree of competence generated by students analyzing social controversies in terms of stand taking. Such devices as multiple-choice, critical thinking and oral analyses formats are used. Consideration has been given to the transference into reality of the jurisprudential skills of students. Some efforts have been made to employ direct and indirect observation and anecdote as methods of evaluation where students engage in 'street-corner argument'. Notably, there is a tacit interest throughout the battery of assessment devices to determine performance probabilities in non-school settings of the pluralist order. Critical thinking tests that have been typically relied upon to convey faithfully the outcomes of the jurisprudential model narrow most students' performances to conceptual and logical rigour in the 'cut-and-dried' analyses of issues. A problem within this program is whether instructional efforts and the concomitant assessments actually prepare students to take decisions arrived at into the realm of the practical. This type of 'environmental

competence' as a curricular concern is broached ten years later by Fred Newmann (1975). In the 1966 program it seems warranted to suggest that much of the critical, political judgment of students remains within the classroom exhibiting, many of the properties of an idealist exercise.

To the credit of Oliver and Shaver, they recognize the probable institutional conservatism engendered by the use of legal-ethical procedures. This sentiment is strengthened when I note that 'rationale justification' would seem to be an integral component of any implementation process.

F.M. NEWMANN, EDUCATION FOR CITIZEN ACTION (1975), "BUILDING A RATIONALE FOR CIVIC EDUCATION" (1977); AND F. NEWMANN ET AL, SKILLS IN CITIZEN ACTION: AN ENGLISH SOCIAL STUDIES PROGRAM FOR SECONDARY SCHOOLS (1977).

Newmann's major 1975 work has been identified as parallel to early reconstructionist work such as that of Counts, Rugg, Childs and Brameld in that it proposes "...a link among moral deliberation, intentions, enabling skills, and community involvement" (Nelson, 1977). Newmann grounds his justification for a revitalized civic action curriculum by portraying the general sense of cultural and political malaise and personal powerlessness endemic in the everyday life of citizens in the advanced industrial nations. He informs his readers that the majority of the attempts at citizenship education programs have offered confused, non-reflective and atheoretic rationales for their curricular

prescriptions and strategies. They are often hopelessly naive or contradict the intended aims of social studies programs. He considers that most programs suffer from an absence of a critical, active conception of citizenship and what is proposed is easily multiplied or incorporated into the technical 'logic' of institutional life.

Newmann contends that education for active citizens in a democracy requires a broadened conception of citizenship and of the strategies needed to realize it. He envisages students in conventional secondary schools engaging in collective institutional change, at the level of local educational policy and in the everyday decision-making routinely required of citizens in a 'constitutional democracy' beyond the boundaries of the school.

In order to set the tone of the following brief description, I rely on Nelson's quotation of Newmann concerning the relationship between the citizen and the state:

...first, that the purpose of civic education... is to teach students to function in a particular relationship with the state. Second, that the most desirable type of relationship between the citizen and the state is the structure of constitutional representative democracy. Third, that the major way in which this political arrangement differs from others is that the state 'belongs' to the citizens, and the citizens have certain inalienable rights to influence what the state shall do. The primary educational mission, therefore, is to teach citizens to influence the state. In contemporary society the inalienable right to do so (that is, the key feature of representative democracy) cannot be exercised.

(Newmann, 1977, pp. 3-4)

This position is clearly a more sophisticated expression of some of the political-economic contradictions in the modern state that were implied in earlier positions formulated by Counts (1969) and Rugg (1936). By proposing a much more elegant image of the macro-society, citing its basic deficiencies and the expected function citizens should assume, the lines of argument for the derivation of practical program prescriptions are that much more transparent.

The essential curricular outcome Newmann anticipates from his design is that of 'environmental competence' for students as future citizens. In spite of the presence of a number of forms of competence to be taught, each is simply expressive of the general capacity for students to influence the course of social events in directions congruent with their intentions. Newmann's position is justified in accordance with ethical, political and psychological principles. Content, within this program, incorporates theory, applied knowledge and selected issues through which the humanly innate interest in autonomy and self-responsibility is given expression. Such content is codified in course packages over a four-year period, and exposes students, under the rubric of social studies, to instrumental knowledge indispensable for the exercise of influence in public life. Social science concepts and methods, concepts and theories of social psychology and the humanities 'dovetail' as components of pedagogic theory. Semester courses in group dynamics, political-legal decision-making, and organizational

administration represent some of the areas students draw from to become 'sensitized' to the political and personal realities of gaining the competence to influence their environment successfully. Students are expected to engage in an extensive action project in relation to a problem of injustice, public policy or issue in the outside community that arouses their moral and emotional scruples. Newmann conceives that the ability to influence public affairs component is complementary to the conventional school syllabus. He argues for an even more comprehensive interpenetration of discipline areas in the service of the primary goal of the revitalized secondary school curriculum—environmental competence.

Three pedagogical formats are envisaged for the social studies program. Considerable time is devoted to instruction on the

...realities of the use of power in politics and law, or research skills required to make intelligent factual claims about those realities, and on ethical, legal and political concepts that help us make principled personal choices on issues and strategies for action.

(Newmann, 1977, p. 16)

Secondly, it is anticipated that students will engage dialogically with one another on the normative grounds of judgements of 'proper' courses of action, on the secular bases of justice and fairness and on the value dilemmas implicit in institutional life. The model of social discourse employed in this phase of environmental competence is clear-

ly rooted in the jurisprudential model of teaching. The extent of teacher participation, however, has diminished.

Thirdly, students either singly or collectively embark on a form of collaborative teaching and learning in the context of a practicum oriented to the successful restructuring of some set of relations clustered around what is taken to be a problem. The three pedagogical formats, which in practice would likely overlap fluidly, also incorporate the earlier elements (of ten years ago) of instructional processes, reflective deliberation and action.

The final element in this program proposal has been elaborated. Actual pedagogical and curriculum provisions have been made to remedy the essential hiatus between theory and practice. To this end, I have addressed the 'political' problem of taking decisions and acting upon them in the effort to vindicate the theoretic representations of the curriculum.

The problem of evaluative criteria associated with the development of critically-minded citizen projects persists. Unless systematic effort and program mechanisms are applied to reconcile curricular theory and practice, the forms of evaluative activity will reassume a strictly technical means-ends character wherein students' successes in direct instructional courses will resemble a recitative knowledge of course constructs. Success in the deliberative phase will become the demonstration of logical consistency in argumentation; and, success in the practicum or action phase would be narrowed to the demonstration of 'valiant enthusi-

asm and applied influence. It is unclear whether Newmann holds what is essentially a dialectical conception of curriculum development. Despite his introduction of the notion of dialectical synergism in cognitive development as a theory of learning (Newmann, 1977, p. 21), it is conceivable that the social structural dimension of social reality is disembodied from the psychological-geographical dimension of human consciousness. If a case can be made for this split between different moments of the social world then, by the logic of Newmann's own omission, the probabilities for a generalized environmental competence are much reduced.

DONALD W. OLIVER, EDUCATION AND COMMUNITY: A RADICAL CRITIQUE OF INNOVATIVE SCHOOLING, (1976).

Oliver's recent work represents the outcome of taking the alternative but complementary path of the "forked road" that loomed after the seminal "Education and Community" article of 1967. It should be noted that Oliver's current work, in contradistinction to Newmann (1975), features an evolutionary rather than an activist perspective. Both works seek to redress the alienated, fragmentary existence taken to be a property of the life-world in the advanced industrial state. There are also deep moral and ethical interests underlying this perspective, for Oliver.

Rather than striving for social reform through school-based teaching and learning as in the 1966 work where the

central pre-occupation was the preservation of the universalistic values of negative freedom and tolerance for dissent and diversity, the focus shifts ten years later to a reconstitution of the primary community and an attachment to the particularism of group ritual and celebration. Still present is an earlier emphasis on demonopolizing the hegemony of professional educational knowledge and practice. However, the secular thrust towards reform and the capacities to cope in the dominant, technical order have receded to a more distant horizon and are replaced by educational and political agenda structured to re-establish traditional bases of meaning. Notably, any analysis of the public school as a contemporary institution functional for dignified human survival is suppressed. Proposals for curricular and pedagogical revision are strongly underdeveloped in light of the fatalism that Oliver seems to accept regarding the dependent links of schooling with the technical order. Saliently absent is any profound analysis of political-economic structures that have a bearing upon the cultural and ideological complexes of the society.

Oliver's primary thesis depicts complex, industrial society as being in a state of historical imbalance in which the secular social form of "Corporate Organization" (Oliver, 1976) has come to dominate the productive, symbolic and psychological life of the citizen. Community, as the alternative social historical form of human relationships, has receded accompanied by a pervasive meaning and morality crisis. Former collec-

tively-shared normative conceptions of the world in which interdependence, affective ties and a sense of common fate which bound members of the human group are replaced with a social technical order based on rationalization, extreme division of labour and the importation of production principles. The resultant imbalance in "systems of sociality" has placed the human species on a survival crisis trajectory in which man's natural biological and cultural constraints are shattered. The fragile interdependence between man's evolutionary cycle and the non-human living world is dissolved by the 'overdetermined' character of an infinitely, adaptive, cultural symbolic system (represented by the dominant acquisitiveness of a control-seeking technical order). Such an 'ideological' symbol system has properties that mask and distort more primitive, underlying needs such as harmony with a truly complex universal animate and inanimate order.

Theorists of the social sciences are familiar with the classical distinction of society and community, first formulated by Toennies over a century ago. Several strategic responses are offered by Oliver to correct this 'imbalance'. On one level he advocates the construction of a 'counter-ideology' which builds on our knowledge of authentic human and universal needs. At a second level we see him advocating a form of structural synthesis of the forms of the technical order with those of a moral order. The moral component of the synthesis occurs through a communal contexts of alter-

native organizations and social relationships. At a third level he advocates in a restrained fashion the 'humanization' of institutional life in schools. However, having conceived of the school as in a dependent relationship to the technical order, any strategies of amelioration are at best palliatives in the face of the universal imbalance of "systems of sociality" (Oliver, 1976). At this point the distinction between school 'communitizing' and communitarian alternatives emerges. The former refers to the increasingly common process of inserting and secularizing vibrant community traditions into secular agencies of the dominant technical order thereby destroying the natural bases of community life and ritual. Communitarian project-building parallels the need to restore a sense of primacy to particularistic traditions, myth-making, celebration and the integrity of subculture.

Aside from developing an anthropology of human nature and an elegant exposition on the cultural and psychological dilemmas and dysfunctions of the gemeinschaft-gesellschaft schism in modern society, Oliver's proposals for educational reform are parallel to the proposals of the 1967 education-community model. These include organizational and program changes.

- (a) The assignment of the school to a subsidiary support function for more primary institutions and a demystification of the power of 'scientific' knowledge in education;
- (b) 1. The revision of curricular content in order to portray qualitatively new forms of human

habitation. Concurrent with this is a delegitimation of "utilitarian perfectionist" ideology, "developmentalist ideology" and the presentation of "communitarian-evolutionism" as an alternative world-view. (See Oliver (1976) for these definitions.)

2. The development of educational experiences for teachers and students expressive of the new form of sociality.

3. The active establishment of communal organizations or "neighbourhoods" estranged from the sphere of the school.

It is far less clear which particular features of pedagogical style, program content, modes of evaluation or disciplined knowledge would co-exist with these utopian world-building projects. One could expect the spread of teaching styles closely resembling traditional modes of kinship transmission, revelation and communicative consensus (not the rationalized accountability models of schools of the technical order); curricular contents rooted in the folkways, metaphors and lore of the indigenous subculture; and a sense of valuation based on an intuitive sense of the presence or absence of security, identity and the certainty of primal ties. Oliver is pragmatic enough to recognize the institutional opposition to proposals of this type. He is certain enough of the imminence of the technical order that formal instruction, in skills and attitudes functional for life in this order, will be maintained, albeit in a circumscribed

arrangement.

It is difficult to engage in any extensive assessment of Oliver's school-based proposals since they are founded on a utopian model of organization not yet implemented in the mass society. I am in a position, however, to assess the adequacy of his conceptual rationale for the stated purposes at hand, and, in terms of the wider interest of this essay, for its congruence (the rationale) with a critical reconstructionism in the social studies. To what extent Oliver's and Newmann's proposals can address the structure of a social studies curriculum most appropriate for a critically-reflective, active citizenry is a task for the following section.

F.M. NEWMANN, D.W. OLIVER; "EDUCATION AND COMMUNITY", (1967)

Clearly the 1967 article by Newmann and Oliver falls in a line of descent from the reconstructionist faction of the progressive movement. The view elaborated here emphasizes yet another dimension of the multifaceted pragmatist philosophy. Harold Rugg (1936), but equally John Dewey (1965), envisaged the growth within schools of an ideal or utopian community that was intended to mirror a restructured social order. The centrality of the idea of community can be contrasted with its relative absence as a pedagogical element in the earlier Harvard series proposals where a competent responsible, discursive public was the major educational outcome. The position adopted here, with salient implication for educational practice, is motivated primarily by what the

authors see as the impotence of orthodox concepts and approaches to educational reform. The authors contend that most school reform efforts do not radically challenge institutional structures nor curriculum policy but merely look upon reform as calling for 'utopian withdrawal' from the prevailing system's constraints. No position known to the authors in the the history of school reform programs offer measures to reconstruct the total structural context through which the community pursues its educational aims. The authors are in agreement with Harold Rugg, who, in American Life and the School Curriculum (1936) claimed that the

(nearest approach to a school of living) is to build the whole educational program of community around the school.

(quoted in Newmann, Oliver, 1967, p.94)

Many interpretations can be drawn from the essential ambiguity of this passage as Donald Oliver makes clear in his 1976 work (Education and Community...). The practical distinction between 'communitizing' the school and 'communitarian' reform within the neighborhood is not resolved in this passage by Rugg. The essential point that Newmann and Oliver (1967) wish to make through Rugg is that in order to restore some authenticity and intimacy to public life, in the advanced societies, it is necessary for the school to "insinuate" itself into adult community activities both as a method of study and as a means of social reconstruction. It is clear that this intention necessitates a change in institutional arrangements to allow the implementation of this broader conception of education -

an education de-monopolized from expert control and legitimation.

Newmann and Oliver maintain that earlier efforts at school reform have been unsuccessful due to the lack of recognition of the role social contexts play in how education is provided. Their argument elaborates how context mediates revision of curricular intents as much as it does innovation inside and outside the school organization.

Implicit within this virtual truism of social science is the more novel conception, for educators, that education as a human process rooted in a network of social relations in the community is often manifested, more authentically, in other than formal instructional contexts. The close but restrained parallel with Rousseau is not explicated here.

Newmann and Oliver propose an educational model containing three elements or dynamic contexts for learning. The school context is distinguished by a conception of education-as-planned systematic instruction. Program content and pedagogy centre on the mastery of basic literacy skills and the internalization of behaviours congruent with a pluralistic democracy. Content is above all problem-centred where skills and conceptual competencies emerge to the extent that insight and understanding of social problems is enhanced. The laboratory-work context serves as a forum for personally chosen "broader humanistic and aesthetic goals" (Oliver, Newmann, 1967). Learning in this context is operative in the midst of the human practice of task-oriented activities. It is not seen as a training ground for vocational preparation. The community-seminar

context is structured for the purpose of the "reflective exploration of community issues" and "...ultimate meanings in human existence" (Oliver, Newmann, 1967, p. 96). Within the total model it is this third context that homogenous and heterogenous groups gather to examine, discuss and take action on issues of mutual concern. There are several classes of issues that Newmann and Oliver anticipate would be focal for the community. These range from concerns for action of a corrective nature for specific persons; general public policy questions; broader questions involved with planning education for the community; pervasive structural issues related to macro-society sectors (such as educational relations with the economy, polity and authority structures). Students' involvement is assumed in each of these contexts but clearly those adults with experience, expertise and leadership would assume more functional positions.

Unlike my review of other program orientations in the Harvard series, the community education world defies simple analysis into common categories of pedagogy, content or evaluation and those of a curricular or problem-centred nature. Bestowing this educational model with a uniqueness not displayed by the discrete component structure of other means - ends program designs means that Newmann and Oliver ground most educational activity in the different contexts upon the notion of the interaction of reflection and deliberation. Closer, reciprocal relations between the problem-posing needs of the community, the interpretations given by community members, and the action based upon a deliberative consensus construe

educational practice as congruent with social and community change. Curricular planning moves much closer to a broadened notion of educational planning as an emergent process arising from the basic concerns of particular communities.

If I distance myself from this model, only slightly, one acquires an image of complex social organization interpenetrated with a 'plurality of structures and processes'. (Jencks, 1972) in which competing private, public and voluntary groups are mobilized ultimately by a commitment to building or re-building a primary community of intimacy and meaning.

A conception of evaluation criteria tied to a quasi-dialectical model of action and reflection, in the laboratory and the community seminar contexts, relies on the success of a chosen strategy for resolving critical community problems. Students are seen as engaged in learning that provides/permits immediate construal of their lifeworlds in terms of particular sets of interests or projects in which they may spontaneously engage. A convenient illustration is that of the Highlander Folk School project in Tennessee; surprisingly, Newmann and Oliver do not use this school example for their purposes. However, the Highlander project is one instance of the unity of pedagogy, curricular content and procedures of evaluation. It is an example of "an action". Here adult educational programs involve the teaching of adults how to teach others to deal with social problems. To appraise the validity of reflectively-derived action in this example is to determine whether the problem

in question is resolved satisfactorily in terms of participants' needs. Program content consists of lifeworld problems affecting the students while the teaching and learning arrangements are directly conditioned by the nature of the emergent problem.

The 1967 Newmann-Oliver position represents an image of formal schooling as one subsidiary element in the personal and shared lifeworld of the individual in the community. Social deliberation and reflection are key processes that may be formally transmitted at the level of skills in the school context but which achieve historical and political significance when transposed in complementary educational contexts of an emergent community. The reader should be cautious lest he interpret this discussion of the 1967 position as an identification of the education community model with an emancipatory social education. It should be noted that although clearly illustrative of a progressivist line of argument, it leaves questions about basic contradictions in the structure society, the effects of alienated social relationships and the underlying spectre of exploitation unanswered; the very questions, of course, that were occasionally highlighted by early reconstructionist extremists.

In examining a number of developments over the following decade in the Harvard School associates' programs and proposals for citizen education curricula, it becomes clear that the 1967 model was in many ways a watershed for both Newmann and Oliver. On the one hand Public Issues exponents

such as Shaver, and Larkins have remained in a pre-paradigmatic state of intellectual evolution while on the other hand the neo-community and citizenship exponents such as Newmann, Oliver and recently Berlak (1977, 1981) have undergone a 1967 paradigm 'shift' in terms of conceptual position. One which in a way incorporates the qualitative dimensions of the pre-1967 and 1967 paradigm in a newer curricular formulation or synthesis. This is not to suggest that both Newmann and Oliver have followed the same 'revolutionary' epistemic directions. Newmann in the 1975 work (Education for Citizen Action: Challenge for Secondary Curriculum) has maintained a sensitivity to the tenets of the 1967 model, yet develops a conceptual rationale and program design that situates the struggle for a critical citizenship within the prevailing legitimacy of the school.

A DOCUMENTARY ANALYSIS OF HARVARD SCHOOL SOCIAL STUDIES

There has been no major programmatic offering of the Harvard School exponents since the introduction of Donald Oliver's latest work based on the education and community theme. A primer oriented to classroom practitioners has been developed by Newmann and associates and contains implementation strategies and suggested skill repertoires that should accompany a social studies-humanities based citizen-action curriculum. One reviewer (Nelson, 1977) sees the latest document as a regression in position from the thesis enunciated in Newmann's 1975 work. Despite the latter's aware-

ness of the difficulties that would be raised at the institutional level for installing his program, reviewers have conceded that the 1977 skills oriented booklet represents a considerable compromise in terms of the practical outcomes for community action and in terms of the latent analysis of social structure that colours this collaborative effort at 'being practical'.

Aside from the preceding comments, it seems possible to claim for the period 1966-1976 that the Harvard School associates have been faithful to a line of political and educational thought that we can term moderate reconstructionism. Unfortunately, the specific historical conditions that gave rise to those unique curricular proposals have been obscured by the widespread but uneven incorporation many of these principles have undergone in the last decade in North American schools. Oliver (1976) points to a similar symbolic and political incorporation of formerly 'radical' ideas with his distinction between the community school and communitarian educational arrangements.

By and large, however, ranging from the Harvard Social Studies Project in 1956 to the current formulation on the community context and on the need for rationale building in the social studies, I identify a reformist orientation possessing a distinct cutting edge that so many other approaches to citizenship education have been lacking. In each of the works reviewed, an active social epistemology of curricular knowledge has been present which has been carried

through to a deliberative, rationalist and at times reflective mode of teaching and learning. One could argue that the jurisprudential mode of teaching contains within it the seeds of reflection and community action that have merged in 1975-76. Content has increasingly taken on a problems-of-daily-living focus such that the boundaries between school knowledge and everyday knowledge are increasingly porous. Teacher-based manipulation of content and the engineering of 'exciting' issues to generate student incentive have subsided, at least in rhetoric, to a point where major components of Oliver (1976) and particularly Newmann's curricular model require profound contributions from student perspectives. Such can be elicited through discursive, constraint-free speech communities. Discipline-based knowledge in the Newmann program has lost its hegemony as an intrinsically valuable form of knowing. Formal instruction in the latter program is primarily a means to an end: the development of personal and collective environmental competence in the influence of public affairs. Each programmatic shift since the 1967 watershed has indicated a more systematic contextual awareness such that program designs make practical provision for accommodating external social influence and personal perspective in reaching the goals of rational, critical citizenry with competence in decision-making.

It may be useful to denote some disparities within the deliberative tradition of the school itself. As to the question of evaluation, qualitative changes are evident when one considers that assessment procedures in Oliver and

Shaver (1966) and in Newmann and Oliver (1970) were primarily a classroom-bounded, paper-and-pencil format that sought a conception of valid learning through the matching of student argumentative and debating skills with the ideal canons of rational-legal inquiry. This model made sense if one could assume a social situation of all-conditions-being-equal (ceteris paribus) and in which well-argued thought unproblematically transfers, to the realm of rational action. The back of this idealist model of evaluation appeared to have been broken with the later education community and citizen-action programs of 1975 and 1976. The validity of curricular representation, of collaboratively produced knowledge and argument was supported by its success in resolving the public issues students chose to investigate or influence. In Oliver's case the wisdom or 'correctness' of learning outcomes rested on their contribution to feelings of intimacy, authenticity and fellowship in evolving primary group settings. To say whether these qualitative extensions in conceptions of evaluation actually contributed to the necessary goal of reciprocal reconciliation of theory and practice in teaching and learning is another issue. But whatever their outcome for social learning, (Habermas, 1975), the more recent proposals for teaching, program content and evaluation modes can be seen as the logically cumulative expressions of the original political and ethical premises of the 1956 Social Studies projects.

Other sources of conceptual and practical disparity with the Harvard School, although not massively contradictory, are the

phases each author went through with respect to the elemental social forms in which political education would be situated.

It is clear that for the 1966-1970 period Shaver and Newmann were tied conceptually to the social context of situationally-bound, idealist-rationalism (where correct speech led to mutual respect, amongst students, of valid cultural differences and hence to implicit support for pluralist social forms).

From the situation of 'pure speech' as the elemental social form, one can detect a shift by 1976 (for Oliver) to the lost, romantic community as the primary source of meaning for students and neighbors. This shift can be conceived of as a fatalistic retreat or withdrawal, by some, from the overwhelming irrationalities and 'repressive tolerance' (Marcuse, 1964) that had afflicted corporate society. 'Pure speech' for Newmann (1975) came in the social form of a discursively, deliberating public in a network of relationships constituted by human interest and political action.

From the ideal typical viewpoint, the social form of the pedagogical-curricular element embedded in the community-as-romantic retreat (Oliver) and within the discursive-political public (Newmann) by itself is a necessary but not sufficient precondition for the responsible, critically-minded, decision-making citizen that is argued for at length with each of the Harvard associates. Until other necessary conditions for critical citizenship are specified the sometimes disjunctive curricular revisions are difficult to explain. This problem is pointed out, ironically, by Fred Newmann in his "Building a Rationale for Civic Education"

in 1977 as he speculates on the sense of malaise and misdirection in social studies civic education. His diagnosis of the presence of incomplete rationales in social education sees designers and theorists disposed to commit unjustified, unclarified errors of assumptions, and contradictions regarding goals and methods. By highlighting the practical dysfunctions and 'no significant difference' findings associated with the model 'muddle, Newmann (1977) and Shaver (1977) go a long way to redressing the historic problems of an absence of public justification and of fragmentation of social education research in the area of citizenship.

This new sense of reflectiveness on questions of basic premises is most strongly articulated in recent research on 'rationale building'. James Shaver in a 1976 presidential address to the National Council for the Social Studies claimed repeatedly that, of all the deficiencies involved with social studies citizenship curriculum development, it is the failure to become explicit regarding the philosophical and empirical assumptions that underlie our formal program intents and the methodology that realizes these intents that are the basis of the pervasive "mindlessness" in educational practice (of which social studies is the "epitome"). The 'hidden curriculum' of our design proposals and policy directives steers theorists and practitioners away from dealing "with the questions of purpose and justification of purpose" (Shaver, 1977, p. 302). It is nowhere more 'mindless' than in the area of citizenship education. Such a conclusion is parallel

to the less polemical remarks of Kehoe (1974) who raised similar questions regarding the absence of a rigorous perspective or focus on the nature of citizenship. We can also consider the role of formal knowledge in the development of such curricula and the principles of content organization and selection that presumably converge in a nexus of social relationships that mediate an attitudinal and political outcome, termed civic behaviour. We have systematically neglected the pragmatist's axiom that, for students, everyday problems are the pedagogical basis of interest in learning. We have substituted academic (problem) content serving others' professional interests for lifeworld needs of the school, community and home. Both Newmann and Oliver in their later work recognize the commission of such a fallacy in early Public Issues treatments of social problems and values dilemmas.

In a 1977 position paper entitled "Building a Rationale for Civic Education", Newmann outlines a framework of elements that any revitalized program in social education must incorporate in its 'public' process of deliberation on purpose and method. He makes an effort to avoid a charge of ethical relativism by taking certain positions throughout the paper. He makes the assumption that any framework or rationale should conceive of the 'effective citizen' as integral to some community or constituency of interest. From here Newmann poses questions regarding the nature of the fundamental community, that civic education is intended to serve and the ultimate group referents for citizen loyalty and responsibility.

It is my conviction that few, if any, citizenship education programs have thoroughly addressed these issues. It could be argued that the Brameld and the 'early Counts' formulations identified those constituencies in the form of the world working class and its labor history. Yet serious lacunae are evident when the reflective social educator asks for a socio-historical and ethical grounding of the intents associated with the position. There was as much naive optimism over the power of natural science inquiry and the institutional openness of the school in the 1930's reconstructionists as there may conceivably be in the unexplicated assumptions of present partial and disembodied rationales of many social educators.

It may be useful to examine some of the alternative conceptions of constituencies in which citizenship education could be grounded. Newmann proposes that one constituency referent could be lodged in the particularistic memories of community membership (a turn of phrase similar to Oliver's education and community theme) at the level of collective consciousness or what we term one's cultural heritage. Or conceivably there may be no empirical community referent for citizenship effects but instead that civic responsibility be directed to the maintenance of secular principles of justice, truth and equality. This assumes the presence of sufficient commitment and skills that could be directed to this end. Buried within the absolutist rhetoric of the extreme reconstructionists such as Brameld, Hook, and Benne, was a constituency referent similar to Newmann's principles of human interest. Pointedly, however, such a

symbolic constituency in this case was not presented in a way which teachers or the public could meaningfully grasp and debate. The educational principles that flowed from early radical socialist positions had to be accepted, *prima facie*. The methodology and principles of knowledge organization then clearly made sense only to partisan groups.³

Newman indicates that the implications of a sufficiently broad definition of critical are such that group affiliations, per se, risk being repudiated whereby the reflective citizen exhibits a loyalty only to principles of truth, critical inquiry and justice. Many of the possibilities citizenship social educators have for developing justifiable, defensible, conceptually-coherent rationales flow out of explicit images of the nature of social reality, of knowledge and of learning. From this images and rationales, in turn, principles of curriculum practice are deduced. If the rationale is to be seen as a "vehicle through which the educator justifies to the community" (Newman, 1977, p.31) his delegated power theorists have an ethical and an intellectual responsibility to convey, if they are reflective ones, the structures and functions of their programs, in their particular and their wider contexts.

Through this review of the Harvard School associates, I have traced their intellectual and spiritual roots to the reconstructionist movement of progressivism. There is some precedence, then, for seeking to cultivate through the curriculum a dynamic form of discursive communication and thought. This kind of thought

allows practitioners in some cases, to separate the objective from the subjective interpretation of the world, in other cases to use it as a tool to dispel propagandistic 'ideologies' while in other programs discursive or dialogic communication has been seen as integral to informing action in the face of collective struggle. Shaver (1976) warns how the uncritical use of educational terminology, without the proper explication of principles and root metaphors or its correspondent societal forms, can, in program development, lead to naturalistic fallacies of the type Kohlberg and, more recently, Fenton are ostensibly guilty of. That is, "if one engages students in the discussion of moral dilemmas in hopes of raising their stages of moral reasoning, one has accomplished (moral education)" (Shaver, 1977, p.306). These risks are in part attributable to a narrow, ahistorical linguistic focus that accepts uncritically the 'things of logic for the logic of things'. A reductionist, technical conception of classroom-bounded competencies incurs the probability of reifying concepts and models at the expense of the practice of the lifeworld.

I can readily see the basis for linking epistemologies (derived from a particular instructional and philosophical orientation) with an ethical stance when so many models celebrate the procedural features of thought at the expense of a commitment to truth, justice and equality. It is, hopefully, not a gratuitous assumption when I say that Newmann recognizes this relationship since: "in this sense program decisions

(can be) seen as outcomes of struggles for power - not as dispassionate intellectual inquiries about the ideal form of education" (Newmann, 1977, p. 30). Without an unearthing of assumptions and dominant images regarding the implied nature of social relationships and knowledge constitution, all "intellectually complete rationales (can be seen as) merely rationalizations served up by vested interests striving to gain or maintain power" (Newmann, 1977, p.30)

As a result of this analysis, I feel justified in offering an argument at some length on the wider implications that may follow from the positions of the Harvard School reconstructionists.

Despite many references to and usages of the terms 'critical' and 'critically-minded' public or citizen, there has been little evidence as to their observable behavioural or attitudinal referents. During the 1966-1977 period, this term, or its equivalent expression, has been infused with considerable salience by Oliver, Shaver, Newmann, Berlak and others. Of those social educators it is only Harold Berlak, alone, who has given it a radically political connotation. The remainder of the associates in most cases refer to critical thinking or social criticism or critical citizenry in a 'unpacked' manner that defies essential understanding. These terms are subject to multiple shades of interpretation. The clues to the social and political direction their use may be headed are acquired only by a 'reading' of the context of the passage or docu-

ment in question. One would suspect that, given this observation as an indicator, several of the contemporary reconstructionists have not come to terms with their comprehensive rationales for citizenship education. The reader may be reminded that the same political blindspot afflicted the more moderate, or liberal-democratic reconstructionists of the middle period 1932-1938. Such individuals as John Dewey, William Kilpatrick and John Childs habitually re-interpreted the politico-philosophical positions of one another whenever they wished to appear as apologists of the most opportune position at the time.

Not until the most recent formulations on rationale building and social criticism has consideration been given, by the Harvard Associates, to underlying structural factors associated with socio-political conflict in a society. That is, some tacit radicalization may have occurred with respect to the model of society held by different associates. These have ranged from a liberal pluralistic conception, to a political economic conception, to one that specified the cultural hegemony of one class over other social groupings. In the earlier *Public Issues* and in Oliver's *Education and Community* series, no accounting is made for the exclusion from the classroom analysis sequence of themes on mass exploitation or the presence of widespread inequality and impoverishment over two-thirds of the globe. A rough impressionistic analysis yielded virtually no references to those forms of human relationships. Donald Oliver's attempt at analysis of alienation and fragmentation in the corporate technical or-

der of the advanced societies identifies the explanatory principle as one of 'imbalance' between primary and secular forces. Yet he provides no account of alternative mechanisms to explain such social and psychological distress.

Fred Newmann, in his proposals for citizen action curricula demonstrates an almost naive faith in the validity of current institutional functioning. Students merely toil in the shadow of our grand democratic institutions. For reasons which he outlines he conceives of the competent exercise of influence as a taken-for-granted contribution for self-validating democratic order.

Little provision is made in each of these programs for reassuring the reader that the tacit preconceptions about the social order should not themselves be questioned since a reflective-deliberative public is the norm for communication to which we strive. Warranted speculation on strategies to develop radically-critical publics, intent on large scale structural change is not offered. Because of the general pitch of the justifying phrases employed one would expect some discussion on radical strategies, if only to decide against them. One gains the impression of a sacralized area of 'explosive' significance that is considered beyond the limits of discourse of social educators - an omission that may violate the expressed ideal of deliberative rationality.

It should be noted, particularly in allusion to an earlier reference to the all-conditions-being-equal model of rational inquiry and communication exemplified in jurisprudential teaching, that any omission of reference toward

structural contradiction in macro-society would have implications for any community of communicative relationships proposed by Oliver or Shaver in their 1966, 1970 and 1976 formulations. Considering that student participants, as has been freely acknowledged by social educators from Beard onwards, bring certain perspectives, biases, maps and preferences of the social world to a group that is debating public issues, it is inconceivable that merely 'good argument' would resolve the effect of those forces that 'condition' or sustain particular patterns of social undertaking among students. If we recognize that students' biographies are immersed in dominant patterns of productive, cultural and political arrangements, then the transforming power of one world view for citizen education, implied by the instructional model, and one that omits consideration of structural factors affecting communicative performance and hence, competence, will be weak indeed.

Essentially, I have been expressing a position which in a different structural phase is termed the "limits of schooling" this is (see Hurn, 1970), which for our purposes represents a view of the school's general ineffectiveness in citizenship education. Clearly, this is an area of education research and design that citizenship or reconstructionist educators should focus upon. I raise the question, as nonjudgmentally as possible, as to whether the Harvard School reconstructionist should have as much faith in the school as a locus of change, excepting the work of Donald Oliver? Yet the implications of this kind of analysis find a place in

any, critically-reflective appraisal of reformist curriculum documents. It seems appropriate to conclude with James Coleman's impressions on the effects stemming from a range of citizen education approaches:

...the academic approach, which teaches citizenship in the classroom as something to be learned, much as any other subject, appears singularly ineffective... Attempts at introducing civic responsibility through student government and the like are generally ineffective... Attempts at civic participation and community projects seem to fail because they are seldom carried out...

Merit systems, standards of conduct and the like laid down by school authorities seem to work only for the docile; and for whomever they work, it is questionable whether they aid or impair citizenship education.

(Coleman, 1960, pp.288-289)

In The Adolescent Citizen ("A Sociologist Suggests New Perspectives" F. Patterson ed. Free Pr. Glencoe, 1960.

FOOTNOTES

1. Use of the term, exemplars, in no way connotes a value judgement on the part of the reader as to the adequacy or significance of the Harvard School Programs regarding reconstructionism. The term is used, primarily, to declare a general conception shared by social studies commentators that associates of this School are historically closest to a critical social studies. Hence, we are representing what is taken to be the situation in the field not conferring the conception with any truth status. See recent reviews of this field by M. Levin (1969); G. Martell (1980); D. Pratt (1973); J. Nelson (1977a, 1977b); R. Simon (1977).
2. For a comprehensive exploration of the meaning of 'message systems' see B. Bernstein in "On the Classification and Framing of Educational Knowledge" (1971).
3. This approach has and does lay the designer and classroom practitioner open to a dogmatic mechanicism of style and posture - unable to innovate with confidence. They are in no position to defend the practice and arrangements that constitute the classroom structure. Unwittingly, they contribute, as individuals with vested interests, to an institutional rigidity and conservatism that is often misconceived. The problems of social change at the school and classroom levels is discussed by G. Whitty in Flude and Ahier; (Schools, Educability and Ideology, 1974). The innovation of a phenomenological perspective on pedagogy concurrent with strategies of structural change is suggested.

CHAPTER 6

THE STATE AND CURRICULUM PRACTICE

THE ADVANCED INDUSTRIAL STATE

But evolutionarily important innovations mean not only a new level of learning but a new problem situation as well, that is a new category of burdens that accompany the new social formation...At every stage of development the social evolutionary learning process itself generates new resources, which mean new dimensions of scarcity and thus new historical needs.... In the modern age, with the autonomization of the economy (and complementarization of the state) there arose the problem of a self-regulated exchange of the social system with external nature.... If postmodern societies...should be characterized by a primacy of the scientific and educational systems, one can speculate about the emergence of the problem of a self-regulated exchange of society with internal nature.

(Habermas, 1979, p.164-165)

Habermas in more recent work on communicative action (1979, 1981) has combined this interest with an analysis of the possibilities and limitations encoded in the emergence of the late capitalist state and society. Work in critical theory (see Schroyer, 1973; Offe, 1972) is committed to understanding this social formation firstly, as a structural development within capitalism, and secondly, as to how technical developments and the altered social relations of production will affect the nature of social control and civic participation in everyday affairs. The literature on the advanced capitalistic formation is burgeoning in its range and

depth. It includes perspectives that range from the orthodox-economistic (Lenin, 1964; Mandel, 1975, 1978), to structuralist (Poulantzas, 1973; Althusser, 1971; Miliband, 1973) to cultural Marxist (Lukacs, 1971; Schroyer, 1973; Habermas, 1975; Offe, 1972) to name but a few representatives. I provide a cursory sketch based on research through critical theory of the features of advanced capitalist social formation outlining its visible or projected crisis tendencies and discussing how these affect participation, and practices of reform as conditions of social learning.

Habermas suggests in his work on advanced capitalist society, that it is the emergence of the state as a social, political organ of decision and co-ordination that is historically unique in the evolution of economic and cultural life. He implies that in the evolution of any social system, of the modern era, the growth in the forces of production, technical knowledge, and administrative rationalization also 'carry' with them a new set of political, social, and normative problems that must be accommodated. As new resources are generated, as the organization of production complexifies, as the scale of capital accumulation intensifies progress is not geometric and even on all fronts of social economic life. Within these movements, new historical needs, new forms of social intelligence, and new problems of social regulation for institutions as well as for collectivities of persons develop. Although the critical theory tradition will argue that the problems are conditioned as a result of the internal

capital-labour contradictions of capitalism, it is nevertheless the emergence of social-subjective nature that will pre-occupy the opposed interests of state-corporate planning and social political reforms. My concern in this study has been to thematize curriculum reform as social reform in order that we may understand the kinds of identifications, resistances and strategies to be developed to secure radical curriculum practice as the organization of publics in advanced capitalist society. To this end, it is vital as a citizen and integral to the intentions of this study to characterize the conditioning structure we inhabit in our lives and in our work in order to reflexively plan for conditions of social learning that will meet the "new historical needs" of this era. The history of radical curriculum reform should be the organization of persons, history of emancipation from personal and structural deformations. To gain individual and collective autonomy, however, means to address developments in the organization of communication and of production.

In his 1975 work Legitimation Crisis Habermas distinguishes between social integration and system integration. Each relates empirically and conceptually to one another. A social whole with recognizable boundaries has properties which demarcate it as a system with institutional sub-systems. Historically and functionally these constellations can be said to acquire an identity such as feudal, agricultural society or post-modern state capitalism. Equally, social integration occurs as a collective expression of bonds, cul-

ture, and expectations with persons in a society. The forms and understandings of their bonds and interaction, projected over a time, acquire a certain relational character cemented through coercion, sentiment, authority, or mutual obligation. These relations generalized represent a kind of social integration which can be identified as the means of holding persons together over time. This identity is held collectively by persons but is also held internally through consciousness. The essential boundaries of this social identity for persons are constituted by the negotiated lifeworld. As Alfred Schutz has indicated these lifeworlds each have normative accents or identities. The analysis of the late capitalist formation, because of evolutionary developments, must incorporate these kinds of considerations explicitly since not only has the internal structuring of institutional systems shifted under this economic form but so has the normative organization of social life. The bases, motivational and normative, upon which persons act in society appear to be shifting from the earlier liberal and monopoly phases of economic organization. Analytically, system and social integration shifts can be typified and reconceptualized as a result of their growing interdependence, suggestive of a re-politicization of the civil sphere characteristic of feudal societies. Hence threats to the integrity of the economic system rebound more intensively through social internal life which in turn generates crises and threats to the general viability of the social totality. In an era of reciprocal threats the continued pursuit of the private appropriation of social pro-

duction appears to lead to a constant series of crises in both systems and social integration. With the exception of orthodox economism, each critical research tradition on the state is in agreement that in spite of the enduring capital-labour contradiction, the crises-ridden nature of the social struggle under late capitalism differs from other eras. Any discussion then of the renewed role of the state in this society begins to note the logic of crisis tendencies at work.

"Those of us in the curriculum community who want to maintain these (enlightenment) values must fully understand the possibilities and limitations of the aggressor if their resistance is to meet with success" (Pollock, 1978).

It can be said that in the late twentieth century we, as persons in industrial societies, are both the victims and accomplices of an era that ushers in late capitalist social and economic relations. This is a situation where the state intervenes directly and indirectly to stabilize and direct the accumulation of capital at the same time as it mediates the structural conflicts that threaten to undermine the continuation of the social system. The market economy in this situation has become inadequate conceptually and structurally to produce, capitalize and distribute value-laden commodities. Halpern (1975) and Chomsky (1973) credit the initial emergence of its organized form to the quasi global post war reconstruction. National and international recovery programs for currency, capital growth, manufacturing capacity and resource utilization intervened and coordinated the production of a more or less independent and coordinated system. Clearly, there

were precedents for this kind of state intervention in the economy and civil life in the Europe and North America of the 1930's and earlier. The extent of state-corporate coordination in investment and labour policies and the extraction of surplus value had not, however, been exceeded in the period 1950-1980 in western capitalist nations.

For instance, the units of productive forces in nineteenth and early twentieth century liberal and monopoly capitalism, the medium sized corporation, the commercial sector of small enterprises, and free trade zones have been replaced by national corporate interlocks, vertically integrated multinational and systematic state intervention. Economic activity is concentrated in key industrial, financial and resource sectors in fewer and giant enterprises. This has resulted in a number of outcomes once considered anathema and now an ideological refrain to the romantic, liberal economic mind: fixed prices, internal financing, credit and interest manipulation, foreign policy and trade determination, trade union quasi-monopolies of organized labour, large scale unemployment of labour and capital, unprecedented state social expenses for the dislocated unemployed, and the conscious practice of capital "investment strikes". The former represents a common pattern for western style capitalist nations.

The state essentially co-ordinates a "pseudo market" that sets minimum conditions for production, investment and consumption parameters in order for corporations and groups to receive incentives in the way of policy and economic re-

lief. Viewed as an historical constellation of relations, the state includes an aggregate of powerful business and industrial management, state bureaucracy leaders, and high ranking leaders of the successful electoral party. Although their interests in capital accumulation-expansion and domination are often cross-cutting, the presence of an identifiable overlapping network of political-economic interests can be documented; (see Castells; 1980; Clement, 1975; Porter, 1965; Veblen, 1899, 1923) as instances in the United States and Canada.

The most salient development in the inter-war period only intensified in the post-war 1945 reconstruction has been the virtual disassembly of the market mechanism as an unequal distributor of scarce values. Monopoly concentration and integration, and geometric technical development, disproportionate declines in capital returns have distorted the means of distribution of values and of labour. A difficulty for corporate-state planning in the mid to late twentieth century has been to maintain increases in productivity in expansion on all levels, profitability and to maintain full or sufficiently high levels of employment. In parallel to this has been the struggle to lessen the cost of labour which admitting of political compromise with organized labour. The typical reaction on the part of the state has been to initiate tighter and more comprehensive planning measures to 'smooth out' economic performance and cushion the conflict and social dislocation that occurs with wage earners. The

state empirically and historically allied with business and military interests while not 'appearing' to do so for the mass of persons, seeks to secure the political and social conditions for economic accumulation while concurrently dispensing the social benefits and tending to the manipulation of mass loyalties in order that systems integration can be preserved. The difficulty is, as Habermas (1975, 1979) points out, that as the logic of corporate expansion, consolidation, capital accumulation, and market domination unfolds the social, political and psychological effects on labour (that is, non-owners of capital producing equity) is increasingly severe. The more sophisticated the political-economic organization of society becomes the more deep-rooted are the symptoms of crises of consumption, employment, civic participation and personal autonomy. Clearly, the re-organization of the social structure can occur cyclically through crises-ridden irruption induced by capital re-trenchment, in which case social dislocation becomes increasingly severe and the bases of social integration are deformed or, the 'social system' is restructured on the basis of a new organizational principle. Although late capitalist society evolves economically, the basic relation of antagonism between capital and labour, usually latent in the advanced societies, still determines the parameters of distribution, consumption and work in everyday existence and the limited array of social reforms. Decisions, policy reforms, delegation of power and the organization of the state and the labour

respectively are all centrally mediated by this relation. Earlier historical interests of capital although pallid images of a corporate present remain essentially tied to control and domination of nature, capital, persons, and now the generation of needs (see Marcuse, 1964): What has corroded beyond its historical developmental patterns is the organization of socio-cultural life in terms of its autonomy-seeking, recreative interests. How far the expectational and plausibility structures of contemporary, capitalist-conditioned consciousness can stretch on the labour side of the dialectic is an empirical question. That the state intervenes to construct a pseudo-consensus at the level of conflicting interests, and that it partakes in the construction or sponsorship of formal appearances of the society in the way of electoral politics, emasculated civic culture, reforms and curriculum planning exposes (the state) the extent of its rationalizations in social life. This, of course, contradictorily works to thematize its mediation role, and its potential historical alliances with capital in the public consciousness.

The genuine problem of a planned society does not lie in the economic but in the political sphere, in the principles to be applied in deciding what needs shall have preference, how much time shall be spent for work, how much of the social product shall be consumed and how much used for expansion etc....

(Pollock, 1978 p. 75)

Although Pollock is discussing the problems of an historically extreme form, authoritarian state capitalism, it

is clear that radical analysis can learn from his portrayal of these tendencies for organized capitalism. Interpret the above passage as saying that "rationalization", as a technical-cultural calculus of interests, insinuates itself within all public activities. Areas of public life, once the domain of practical reason and action, are converted into decisionistic trajectories and probabilities dealing with public opinion, the coercive interventions of state, social welfare, foreign policy, labour negotiation, domestic economic policy thresholds (that is, 'how much will they take') and so on. Essentially under organized capitalism and its institutional subsystems all economic problems are transformed to political problems - neither tradition, nor mass sentiment nor "economic laws" escape this pseudoscientific calculative rationality. Personal and collective responsibility as vectors of change are absorbed in decisionistic models of social and economic planning as simply more contingency factors. State planning succeeds with this approach to the extent that it can fabricate the appearance of an institution actively seeking public's perspectives, sentiments and interests as integral material for decision-making. The extent of state boundaries around economic conduct is quite revealing. While many risks that financiers or industrial capital may have once assumed have disappeared, the degree to which their profits are disposed is circumscribed by the state. Price regulation, profit distribution, capital re-investment, and taxation measures are

all actively monitored by state agencies less, of course, for the general social interest and more because of the anarchic, counter-competitive tendencies of the different fragments of capital owners. However, in an historically under-regulated sphere the degree of intervention and internal policing is unparalleled. At the time of writing the Greymac Credit-Crown Trust affair in Ontario has demonstrated not only astronomical profits from one real estate sale 'flip-flop' and a perilously high deposits financing ratio but also an unmitigated provincial government involvement in historically independent areas - the capital investment and reinvestment of financial institutions to the point that the state is able to dispose of privately held assets and corporations. A similar case, again at the time of writing, occurs in Alberta where a well-known regional entrepreneur is involved in real estate development which is financed by an interlocking trust company (Fidelity Trust) that has extended itself beyond a safe equity base. Canadian government involvement here has led not only to disclosures of these transactions but the withholding of registration 'licences' to operate as a trust company, if capital is not refunnelled into the lending company. What this serves to show about state intervention is that much less, upon closer analysis, of its motivation is based upon protection of the public interest (clearly cases in other spheres where it does not act would support this) than it is upon incurring a series of business failures, financial chaos and fear, and a possible 'investment strike'. The other dimension to state

motives for intervention has to do with the kinds of sentiments and plausibility loss amongst non-owners of capital if their savings or money-earning coupons are dissolved in a corporate 'crash'. In one case the state, if it did not intervene, loses vital revenues and control of partial economic planning, and in the second case it loses legitimacy and in the longer term persons' willingness to participate in the appearances of political cultural life. Just the same it is under a regime of organized capitalism where corporate state motives coincide in an amalgam of 'risk-avoidance, market division, and price-interest manipulation'. It is only the large scale corporate interests, whether in finance, media, or industry, that hold a greater degree of autonomy and influence. Middle level and commercial entrepreneurs are fast transformed into rentiers whose income is determined by the state, who are given incentives to invest, but no freedom (negative) to withdraw such capital if the ventures mean a loss of money' (Pollock, 1978).

What possibilities are there for mobilizing conflicting interests, particularly non-owners of capital against the state and its antagonistic social relations? The history of social revolution has shown clearly that the consistently most successful group in terms of its capacity to articulate its interests, accumulate support and its structural understanding of its position have been the middle classes. Of course, I refer to the making of bourgeois revolutions based only transitionally on mass popular support. Yet, it is in

this social class that enlightenment values of equality, justice and freedom find their greatest resonance. As Habermas (1975) indicates, it is within the residues of old bourgeois political culture notions such as free assembly, public opinion and majoritarian influence that the state is, in principle, threatened. The task through monitored planning is to continually defuse these motivational, discursive remnants which could be coupled to motive-forming action or expression that would tend to delegitimize prevailing political and economic relations. Larson (1977), in a highly insightful analysis, depicts a correspondence between growing capital concentration and professional consolidation under the aegis of the state. In the way that the state-corporate capitalism absorbs small scale commercial activity, or leaves it to an anarchic death, occupational technization and 'professionalization' proliferates in the advanced societies but is tightly boundaried and controlled by state agencies. Bourgeois style rhetoric surrounds the sponsorship of occupational technical groups that vie for 'professional' status one with another. Each lays claim for an area of expertise and authority, often in the service and 'helping' occupations, that demarcates some horizon of meaning that its members can invest in and police. What can be seen to happen, according to Larson, is that the state sanctions but also appropriates the essential survival decisions for each occupational group that tries to consolidate - leaving each stripped of any real autonomy or decision-making capacity. In fact, each of

these occupational groups as self conscious political entities has opted to 'buy-in' to the calculus of prestige and authority related to symbolic power over some arbitrary cutting-up of material and cultural reality. What each occupation, in this historical situation receives is a passing promise of recognition from the more powerful in the wonderful game of damaged appearances under organized capitalism; and the capacity to organize smaller groups of persons already mostly appropriated, body and soul, to an invisible but prevailing hegemony.

Political domination in organized capitalist states is achieved on a number of fronts the least of which is physical coercion. The state-corporate complex is able to promise persons or classes of persons, more usually, the prestige, security, and comfort that is assumed to be waiting in regulated occupations, suburban dwellings and stable disposable income. The 'abundant life' is equated with the 'good life'. As a result the former sphere is suitable for the manipulation of needs and satisfactions both through the 'consent' of the consumer, and the range of commodities available. Clearly, in prevailing over the interests of capital in this way, the state seeks to turn the productive forces and surplus value generated by labour (mental and manual) against the possibilities of a generalized interest. Persons become in this kind of political economy victims and complicitous in turning the organization and coerced labour of society against themselves. Communicative

organization of the social world is a structuring relation that works to suppress the freedom of the individual and his class has become a progressive form of domination in an organized society.

...can state capitalism be brought under democratic control. The social as well as the moral problems with which the democracies are confronted have been formulated as follows....What ways and means can be devised to prevent the abuse of the enormous power vested in state, industrial and party bureaucracy under state capitalism? How can the loss of economic liberty be rendered compatible with the maintenance of political liberty? How can the disintegrative forces of today be replaced by integrative ones? How will the roots from which insurmountable antagonism develop be eliminated so that there will not arise a political alliance between dissentient partial interests and the bureaucracy aiming to dominate the majority.

(Pollock, 1978, p. 93)

As we have seen, the problem of social reform in organized capitalist society often comes down, but is not reducible to the 'asymmetrical relation' between capital and labour. As Mandel (1975, 1978), O'Connor (1973), Castells (1980) point out, the state is faced, as one consequence of this basic relation, with the chronic tendency for the rate of profit to fall despite productivity gains, cost consolidation and differential investment. Yet the state can only intervene systematically, so far, in the capitalization process without causing disincentives to invest on the part of major financial interests. At the same time, as we experience presently in 1983, economic and social dislocation result from the quasi-anarchy of competition

amongst capital blocs. Intervention is necessary for the state to secure legitimacy and offset motive-forming dissent. Yet to thematize intervention too far has its attendant risks. The likelihood of continuing and increasingly severe economic crises is real, as is the possibility of derivative crises or socio-political deficits within the society. This is certainly true of Canada, presently complicated as it is by its relative underdevelopment and quasi-annexation by the United States economy. This problem is expressed structurally by the difficulty of progressively appropriating more and more surplus value from human labour and to stem the diminishing returns of profit.

Organized capitalism of the kind I have been alluding to differs from liberal and monopoly phases by the degree to which it systematizes the procurement of capital. The era is characterized by extreme economic concentration and the growth of vertically integrated multinational corporations and large scale national firms. The commodity capital, labour, and service markets although clearly demarcated for sectional interests are highly organized as to external market share and as to internal corporate penetration of their respective markets. The era, as I have argued, is marked by consolidation, mergers, and continual capital reorganization for profitability and sectoral domination. The state, as I have considered, intervenes virtually systematically as 'functional deficits' develop in market anarchy. In earlier eras the market tended to be the

'steering' mechanism of the society economically and ideologically. Habermas (1975) considers that organized capitalism occurs with 'political planning of the allocation of scarce resources'. Up until that time capital deployment operated under boundary conditions set by the state such that the strategies and social effects of capital decisions were unmitigated.

Habermas (1975) defines and characterises the organized capitalist society in terms of three institutional subsystems: the economic, the administrative and the socio-cultural. The economic subsystem contains three sectors of corporate interest that include private-entrepreneurial activity, private monopolistic forms, and public sector industries such as Crown corporations and semi-public or subsidized large scale industries. Public and private monopolistic firms are typically capital-intensive while private-entrepreneurial firms are typically labour-intensive. Public and monopoly corporations face well organized labour unions while commercial or private business work with primarily fragmented, unorganized workers. This distinction has implications for how domination is secured in the organized state.

In the administrative system the state organization essentially centres many planning directives for the economy as a whole within itself; that is global planning that seeks to generate and ameliorate conditions for the accumulation of capital. This occurs within the tolerance limits of individual capital blocs. The state attempts to regulate

overall financial/fiscal performances of the different sectors which include strategies to 'regulate investment and demand'. While considered stabilizing tendencies in the realm of capital, their effect is primarily aversive to risk-taking, by setting perimeters for growth, demand, interest, employment and investment targets. The state acts secondly to generate and ameliorate capital realization on a number of fronts, and thus 'replaces' the market. For the interests of this study the state acts to fill capital into neglected regions or sectors dismissed by the anarchic capital market. It acts to 'improve the material infrastructure' of society through education, health, transportation, regional planning and so on. It acts to develop the symbolic infrastructure in such areas as research and development, scientific grants and patents. It also acts to 'develop labour productivity' through the general provision of schooling, vocational and trade schools, and adult learning. Clearly, there are a number of other key sectors in which the state makes social investments and causes social consumption but these are beyond the concerns of this study. International promotion, diplomacy and other measures are all designed to secure the productivity of capital commodities either directly through materials, financial incentives, credit provision, or indirectly by (manpower) labour preparation in the way of skills and consciousness. Indirectly, schools and curricula are important in developing a kind of reflexive labour in the way of technicians, re-

searchers and quasi-administrators. Mattick (1969) contends that reflexive labour is productive of surplus value in that indirectly, as does the state, it alters the conditions under which value can be appropriated.

Another aspect that can characterize the state's role in the reproduction of society is the generation of rational decisions over economic planning and investments, social conflicts, as responses to public interest groups and the distribution of social benefits. In the same way the private and state capital organization demand as criteria of success, the production of economic values so, too, the administrative subsystem must succeed in producing rational or plausible decisions which can satisfy civic or corporate demands for answers, for policies, or for intervention. In this way the state in its role as a collective capitalist and arbiter of cross-cutting capital blocs reconciles conflict and system integration by the production of values (economic), decisions (rational), legitimation (plausibility), and motives (meaning). These 'outputs' readily quantifiable in a socio-technical culture serve the twin functions of securing accumulation, conditions for accumulation, and mass loyalty.

Since the market as an institution and as ideology is freely manipulated under organized capitalism, its politically contingent nature as an historical phenomenon comes more to public consciousness. Given, too, that as a fair distributor of scarce value it fails, the unrestricted mar-

ket as an organization for 'steering' or integrating society is no longer suitable. The social relations and modes of production now require to be politically directed. Yet this intervention, an irreligious move for popular sentiment, means that there is a legitimation deficit, on behalf of the ideas of state, corporate and entrepreneurial activity, which must be filled.

But state capitalism does away with the market and hypostasizes the crises for the duration of eternal (Canada). Its "economic inevitability" signifies a step forward, a breathing spell for the rulers. Unemployment becomes organized. Only the already well established section of the bourgeoisie is still really interested in the market. Big industrialists today denounce liberalism only when state administration remains too liberal for them, not completely under their control. The modern planned economy can feed the masses better and be better fed by them than by the vestiges of the market.

(Horkheimer, 1978, p. 97)

The socio-cultural subsystem of organized capitalism Habermas conceives of, as providing through an organization of the lifeworld, sufficient rationality and motivation for 'citizens' to willingly participate in routine existence and to believe in the genuine quality or 'normalcy' of institutions and relations surrounding them. This does not mean that 'citizens' actively and passionately subscribe in their conduct to the moral or existential outcomes of economic and political life in the society; only that they do not rationally problematize nor act against its social foundations by withdrawal of their participation. Each of the subsystems I

have described overlap in functional interdependence (similar to Durkheim's 1964 construct of organic solidarity). Each subsystem produces quantifiable outputs such as values, decisions, meanings, and motivations. Since the market mechanism and its ideology of the exchange of equivalents is greatly dissolved as a symbolic device of integration, the general conditions of production are disclosed and risk disclosure of their antagonistic bases. As the market has been a central element in the bourgeois cosmology, the remnants of other external trappings such as civic rights, freedoms of assembly, petition, electoral process and so on have lost their motive-forming power to a large degree. To the extent that these action-laden traditions cease to exist there is a legitimation deficit. Real participation on behalf of citizenry would be fateful for the potency of interest formation and critique would threaten the social complex administered by the state. Formal democracy has evolved as an electoral institution that simulates participation through appearance. Citizens do not partake in action or decision but merely withheld assent from one pre-determined option or another. Political culture has been reduced to a ritualized passivity - a breeding ground of complacency, cynicism and self-doubt that anyone can 'understand society'. Substantive or democratic participation threatens through the consensus-making of its public to expose the private appropriation of socialized production more by 'anatomizing' the latent class structure of society. Formal or "anticipatory democracy" (Burt) secures mass consent but emasculates

the formation of grounded motives that reach for autonomy. Decisions are always being made for citizens, by others in an infinite range of expertise, for them by the state, by the school, by service industries and by media. Specialism and pseudo-professionalization fragment and undermine the historical integrity of the public sphere. Insidiously, a latent kind of class stratification is continuously reproduced through the anonymous organization of others.

It is catechism of the art of (authoritarian) rule that the differences between the ranks, whether it be skilled or unskilled labour or between races, must be systematically furthered by all media of communication - newspapers, radio, and movies to isolate individuals from one another. They should listen to everyone, from (Trudeau) to the local boss, but not to each other. They should be informed about everything, from the nation's policies for peace to the use of blackout lamps, but they should not inform themselves. They should lay their hands on everything but not on the leadership. Humanity is thoroughly educated and mutilated. If a region, for example the United States or Europe, is great or powerful enough, the machinery of oppression used against the internal enemy must find a pretext in the threats of the external enemy. (Witness the foreign and domestic policies of the Reagan government in 1982-83). (Emphasis mine)

(Horkheimer, 1978, p. 103)

According to Habermas, in the organized societies, legitimation is structured through the symbolization of 'civic privatism' in vocation and leisure and through the seepage of technocratic thinking and 'appliques' to all realms of the organized lifeworld. I have discussed this distinct 'privatist' syndrome more fully in Chapter 1. It involves

a concentration of persons' energies and talents in a possessive narcissism of homelife and ownership, extensive and conspicuous leisure routines, the procurement of financial security, and the fanatical preoccupation with achievement/advancement in work, games, possessions and indeed, ironically, in a cultivation of the 'natural life'. Belief in the panacea-like qualities of purposive, technical thinking is coupled to the practice of privatism such that persons compete spuriously amongst themselves and others oblivious to the basic antagonisms that propel them further and further into an autonomy-denying narcissism. School organization and curriculum development emphasize the appearances of cooperation and 'interaction' but essentially reward the quietly, furious, competitive performances of students who recognize not others, or the society they live in, but merely the distinction between work and play. Each of these cultural forms serve to sustain plausibility in an overarching way, of the organized relations of a society they inhabit by turning persons inwards, non--reflexively against themselves and others. The practical depolitization of social relations thus achieved instills in popular consciousness the history of society as a 'natural history'.

Organized capitalist society has evolved a complex response to crisis in all its dimensions. Its primary interest is to subdue economic crisis so as not to uncover the capital-labour antagonism or class relations of society. To this end our crises, of different types, evolve to contain human

collective energies within the prevailing social structure. Social class is a somewhat invisible relation in North American society. The fact that it has a non-appearance should not deter radical curriculum inquiry from uncovering it as a constitutive relation of our social world of ours and our students. Reform, particularly of the type sponsored by 'helping professions' such as social work, school teaching, law, clinical psychology, social democratic groups, is an endemic response in our time that partializes the understanding of conflict and drives solutions ever farther inward to seek a technical solution.

With the obsolescence of the market as an institution distributive of life-chances, capital-labour repoliticises issues of wage settlements, work condition, and entry-exit control over memberships. Administrative processing by the state of this primary political antagonism lead to the 'classic compromise' as adversaries achieve incremental demands rather than real gains. Habermas (1975) indicates that this administrative-political bargaining in the public and private economic sectors distorts the wage structure, job markets, causing permanent inflation and fiscal shortages within the state and corporations. The phenomenon of uneven development, well known in a regional economic context, occurs across the occupational sectors pitting 'workers' against one another in an infinite spiral. These social costs primarily absorbed by the state, or redirected through interest rate manipulation to labour, are distributed across

the softer social service areas such as welfare, education, health care which in turn are distributed unevenly by region. These phenomena coupled then with the links to a global economy reverberate in their effects upon routine life where we experience chronic inflation, increasing cycles of recession and slow recovery, and permanent structural unemployment.

The bulk of the economic crisis is transformed and distributed socially and psychically across dependent groups of citizens who even in their organization of dissent accept less and less real response from state and corporation. In a wave of fatigue it seems as if partial public dissent organized around rights issues simply witnesses the decline of historic public services if only their voices are just 'heard'. In what Schroyer (1973) has termed a 'refeudalization' of relations of production, serious radical curriculum inquiry must determine whether other practices under organized capitalism can extract economic value and thence domination. Is the political administration of consciousness through service sector 'consumer' relations, such as the student as a consumer of meanings, a strategic intervention of the state in the socio-cultural subsystem? As Habermas (1975) notes, under organized capitalist societies

...the system of world society shifts its boundaries so far into its environment that it runs up against limits of outer as well as inner nature. Ecological balance designates an absolute limit to growth. The less palpable anthropological balance designates another limit, which can be overstepped only at the

price of altering the socio-cultural
identity of social systems.

(Habermas, 1975, p. 41)

Although the implications for the natural limits to growth, and the balances of global economics and politics will preoccupy citizens in years to come, I can only allude to the consequences of global-regional organized capitalism for the socio-cultural organization of character and action. It can be said that, in principle, there are no limits to the characterological re-organization of the person. Clearly the social and political regime that persons inhabit does affect the possibilities for psychic change. Socialization patterns through parenting, peers, and schooling have the recognizable forms and norms of the bourgeois era. If the parameters of socialization relations shift, then, in principle, there is a limit to how consciousness and 'relational capacity' may be shaped or arrested (see Pinar, 1983). Historically, all of us, our children and our students are the products of a socialization grounded in the linguistic organization of intersubjectivity. This means, as I indicated in Chapter 3, that language as speech presupposes that action-interests can be rationally justified or discarded, at bottom. Hence, the communicative organization of action can, as I have noted, become the public device, if politically mediated, that can sponsor critique, autonomy and the collective achievement of rational decision-making. Clearly, this threatens a social system based on veiled antagonism. With the displacement of sophisticated "steering systems" in the

advanced societies the state, for one, as an assembly of controlling groups needs to detach its decisions, socio-linguistically, from the members inhabiting dependent institutions in the society. Habermas (1975) envisages the possibility of "uncoupling" the political administrative subsystem in society from its socio-cultural grounding. In this way, providing the state can ensure a passive consent to the idea of its social appearances, that is, the pseudo-concrete, it can proceed in its planning devoid of the need to furnish reasons or notifications for the actions it initiates. As a result the desire to conform amongst persons could be achieved without the proliferation of reasons, discursively justified, provided that the world of appearances, or the pseudoconcrete and the political trajectories it takes are self-evidently plausible to citizens. To the degree that identity-giving interpretive systems are dissolving in the way we organize and select curricular text and pedagogical relations institutional arrangements must become an item for current curriculum research. One possible scenario is for curriculum theory to reconstruct a real moral education that pursues a communication ethics and universal morality. 2

REPRODUCTION AND LEGITIMATION CRISES

I refer here to the collective and structural consequences for the state, under organized capitalism, if there are deficits of rationality contained in decisions by the state, if persons living in the society feel the prevailing

economic-political arrangements need particular justification, and if persons singly or collectively withdraw, retreat, or protest in their everyday lives from routines of work or leisure because of a larger system crisis. These are three key conditions that can plague an organized capitalist society to the extent its ongoing existence, as a set of social and political relations, is disturbed; that is, the procurements of social labour are disrupted. Although other analytic and empirical tendencies can surely be noted as to state crises tendencies, I refer to these three key ones and their interrelationships as important for understanding socio-cultural problems in resistance and reforms for curriculum planning.

What I argue is that the continued sanctity and reproduction of the state system is threatened if there occur deficits of plausibly rational decisions, policies, or interventions; of legitimation for the continued functioning of the political system; and of motivation for persons to perform as citizens, students, workers or good consumers toward the dominant social reality. If, we understood society as a social system, and isolate one phase of its functioning, we have a situation, as in the above context where benefits (in the way of goods and services) and rationality are supplied as 'inputs', derived from the economic and political-administrative systems respectively, to the social-cultural organization of persons which communicatively mediates their significance in terms of persons' own expectations. From these

inputs of benefits and rationality, once mediated by the interaction of persons, come outputs of legitimacy for the system and motivation to participate supplied by the social meanings from legitimacy. The core motivation to participate in the mundane routines of reproduction, to perform in educational and occupational settings, and to bestow legitimacy on the political system is anchored in the dialectical relations of 'inputs and outputs' which is, in essence, an individual and group phenomenon - the linguistic-communicative organization of action.

Clearly I borrow my analogy, as does Habermas (1975, 1979), from the vocabulary of systems thinking. But provided such a historical framework is seen only for its ability to organize our perspective at sufficient altitude to see the social totality, as a whole, then it is important that it be used in inquiry. Shifts in any of the subsystems trigger effects in the other. Particular historical circumstances affect each of the subsystems differently.

However, under late capitalism, economic disjunctions or crises of accumulation have become relatively constant as have shifts in normative structures or world views amongst all social strata. Considering that the expansive logic of accumulation is mediated through the capital-labour antagonism and that these movements coupled with socio-technical developments are structured into the system, the likelihood of constantly surfacing motivational, legitimation and rationality crises, or in short, reproduction crises, is great indeed. This recognition is one that

an historically conscious curriculum theory must incorporate within itself.

In particular, for the procurement of motivation, the cultural traditions, moral consciousness, and world views generated through pedagogy and curriculum, family, and media that have typically been grounded in bourgeois and pre-capitalist cultural traditions are undergoing change. In a liberal era of capitalism, the screen of bourgeois mythology coincided functionally with the operation of a market-oriented economy. With the ideological-cultural separation of work and power, civic participation split off from productive activity was easily sustained as a cultural element of the society. Under organized capitalism the cultural residues of bourgeois tradition cannot sustain this repoliticization of production through state intervention. At the same time, occupational skill and performance structures, and civic dependency needs shift due to the extension and further commodification of the market. These economic structural requirements force changes in schooling practices, and parenting for which there is no ready-made pool of cultural precedents to draw upon. Since the socio-cultural sphere is vital, at this stage of normative and political-economic development, for grounding mass loyalty it leaves an object of administrative rationalization because of its pivotal nature in securing social integration firstly, and system integration secondly. Ironically, because organized capitalism shifts through its respective crises so

vociferously, it produces new needs for integration concurrently as well as generating needs in persons (material and emotional) which often cannot be fulfilled. In such a case, and one that I still point to with concrete instances, crises of meaning or legitimacy, or rationality, or material scarcity are always at a point of eruption. Horkheimer notes well the ambiguities of freedom and unfreedom we currently face under late capitalism:

In all the consistency which theory can find in economic development, in all the logic of the succession of individual social epochs, in all the increases in productive power, methods, and skills the capitalist antagonisms have in fact been growing. Through them human beings will ultimately define themselves. These antagonisms are today not only more capable of producing freedom, but also less capable. Not only freedom but also future forms of oppression are possible. They can be theoretically evaluated as either regression or as ingenious new equipment. With state capitalism those in power can strengthen their position even more.

(Horkheimer, 1978, p. 109)

...the selection for the concentration camps becomes more and more arbitrary...in principle anyone could be there.

(p. 103)

In order to limit the thematization of dissent or mobilization, the state must draw from the pool of cultural and normative legitimations that have accrued to it historically from other social eras. As I have discussed, if motive-forming action, as in the notion of public discourse, is grounded through the necessity of giving justifiable (in principle) reasons for economic and political policy, then

crises can reach a point that will destroy the plausibility of all formal political actions and become 'rich in practical consequences'.

It follows that the state must act whenever possible in situations that erupt and in sectors of the socio-cultural system to secure its unquestioned hegemony. Administrative rationalization is a favoured mode of intervention in matters of public opinion. This kind of activity occurs through the extensive use of government commissions, judicial decisions, public pronouncements, and the commercialization of messages and decisions. These devices seek to manipulate personal and collective sentiment through appearing to address issues, say, of unemployment, or immigration, or occupational replacement and retraining in such a way as to leave unbroken the structure of prejudice or one-sidedness of issues that persons mistakenly hold. Through finesse, state intervention appears to redress the wronged interests of persons: yet it actually retains them in a state of unreflexive dependency. In this instance, legitimation and presumably motivation is preserved. The relation is generalized in the commodification of goods and services where persons' physical and emotional needs are manipulated in a partial vacuum of alternative cultural resources.

However, there are limits, not completely knowable empirically, to the degree of intrusion in the cultural life-world of persons before the legitimacy of these incursions is bankrupted. If, as Habermas indicates, there are remnants of bourgeois and enlightenment culture that in earlier

eras had a political significance repressed today then these elements as meaning complexes can be communicatively mobilized as critique, analysis, and even reconstruction through either a practical or theoretic discourse. In re-embedding former meaning contents within an inter-subjective nexus, persons release the "semantic potentials" of text and symbol, thereby constructing a kind of future shared history and solidarily with one another. Presently, these kinds of alliances are shaky and shifting, usually organizing on public or community issues that have been 'split off' through a larger structural awareness. I refer, for instance, to the sometimes incomplete strategies of the women's movement over discrimination and abuse, or the student rallies organized around fee increases (plain and simple), or the distress of parents of "average" school children with school districts that extol the virtues of bilingualism, or the well-organized environment movement that fails to trace and publicly demonstrate the links of ecological destruction with capital expansionist logic. In all these cases it is typically the thematization that individuals or corporations or prejudice have erred; that we must take measures to avoid this kind of bad performance in the future. Public, political problems typically have their causal sources distributed along an apolitical continuum from neuroses, criminality, inefficiency, to hypercomplexity. These are measures where state agencies, corporate interests, or their delegates act indirectly to appropriate cultural traditions and resources.

for motive-formation.

Public education over the last fifteen years in Canada has experienced a growth of administrative rationalization in the areas of school finance, policy making, curriculum objectives and selection, and instructional planning.

Traditional curriculum organization was informally codified around the received cultural contents of a society and the life trajectories of students. Currently, the state, particularly through its financial leverage (Schechter, 1977) applies technical rational systematization to everything from goal selection, curriculum writing, teacher-in-service to the re-evaluation of its programs a few years later.

Beyond the obvious control implications for teachers, students and learning outcomes, this action serves to relativize and politicize cultural traditions, conceptions of society, and psycho-pedagogy. The classroom realization of technicized curriculum contents affects how the social relations of teaching and learning are conducted: the nature of coming to know, and to act with knowledge as persons in the lifeworld they inhabit but partially create.

Two examples which demonstrate this technicization of culture and consciousness are the respective versions of the Alberta Social Studies curriculum guidelines that changed unremarkably over the period 1971-1981. Both the more liberal version of 1971 and the 'lighter' version of 1981 demonstrate teacher participation by appearance only. Each requires that teachers and students respectively internalize scientific pedagogy and social inquiry models within a set

of primary instructional options which decreased in scope over ten years (from open-ended to ministry-prescribed). The faith curriculum planners placed in technological thinking for its capacity to realize independence in decision making was misplaced, or was an opportunistic gesture; which one it was we cannot tell. Clearly, though the more that cultural contents are manipulated and normative expectations are altered, through external initiatives, the less power these contents as traditions, or any administered contents have as justificatory devices. If particular semantic and practical expectations grounded in the lifeworld are dissolved (in the effort to 'adapt to change' in modern Alberta) as a gesture in the demystification of the old-fashioned, their replacement can only lie in the restoration of practical interests in the curriculum by deliberation, dialogue and consensus making by the participants themselves. The original "nature like" course of curricular symbolizations of the world, or alternatives that depict the world society and historically only germinate through conditions of practical discourse. To the extent that this intervention happens, too much, counter initiatives form through teacher groups, citizen coalitions, and boards who had symbolically accepted the latest innovation from the Department of Education.

The evidence that teachers, as one group implicated, can only be pushed so far through their privatism by state is clear by their passive refusal to practice the new pedagogical norms of the 1971 and 1978 revisions. Clearly, the quality of peda-

gogical encounters in social studies classrooms was quite separate from whether social inquiry was ever internalized in the consciousness of the schooled. Unfortunately, the retreatism that Downey et al. (1975) discovered amongst teachers is one form of withdrawal from the performance norms of the state; the recommendations that the state knew better were encoded in the 1981 curriculum guidelines for this field. But there are other efforts regionally, and internationally that I discuss in a later section on labour, school, and civic fronts that some publics are resocializing their interests through alternative political models. Again, on a regional level the C.O.R.E. program represents one such attempt to use school-community linkages to politicize a pedagogy of public issues.

A final point has to do with the kinds of warnings the early Horkheimer (1930-1950) makes about the vulnerabilities of freedom in complex capitalist societies. Reasons could be made as to the state's preference for using more repressive or coercive measures to secure mass loyalty and the continuous expansion of accumulation. Certainly, a number of societies in Latin America, Eastern Europe, Soviet Union deploy authoritarian, non-discursive forms of oppression. Yet the fact should not be overlooked that these regimes have economies highly problematic, more unevenly developed, and ridden with fiscal and inflationary crises than the societies of western Europe and North America. Because of the extremity of political invasion in these societies, and the chronic state of economic antagonisms many more generalizable interests are

transparently left unmet. Political coercion becomes an appropriate form of intervention for these societies given the configuration of their crises. In selected organized capitalist democracies these options of social and system integration are simply less appropriate - there is no surplus of social virtue that is available in Canada which could not drain away to become like that of Brazil or the Phillipines, for instance. In the social organization of production of Canadian society the procurement of an 'expansionary consent' is more desirable for capital development than is the narrow repression of needs. Furthermore, the position of Canada in the global capital hierarchy as a politically stable site to exploit, and its close, quasi-integration with the United States economy, cultivates the interests of competing capital investment blocs, with different market priorities to which the state must attend. The most compatible socio-cultural structures for organized capitalism in these societies, are those personality and motivational traits that Bernstein (1971) associates with the 'flexible conforming' man rather than the liberal-monopoly capitalism's 'submissive, inflexible' man.

I suggest the movement away from collection to integrated codes symbolizes that there is a crisis in society's basic classifications and frames, and therefore a crisis in its structures of power and principles of control. The movement from this point of view represents an attempt to declassify and so alter power structures and principles of control; in so doing to unfreeze the structuring of knowledge and to change the boundaries of consciousness.

(Bernstein, 1975, p. 111)

It has been argued through different formulations (Greene, 1974; Habermas, 1975, 1979; Castells, 1980; Mandel, 1975) that the particular motivational complexes most effective for sustaining faith and participation in the socio-economic structure are forms of privatism that seek to divert consciousness of self, of others, and of structures inwards or to sublimate actions and understandings in regressive forms. The idea of privatism suggests an active orientation to the administrative and economic system outputs and a disavowal of interest, in issues of legitimation or problems of meaning in other or in the society they inhabit. In many ways, then, the classical ideal of the dependable if cynical consumer of commodified leisure, values and status. Typically, these reified states of consciousness are inheritances in cultural tradition from a more vibrant bourgeois era of commerce and civic life, that is they are attitudinal distortions uprooted in time and circumstance from a meaning context in which they had a formative-integrative role to play in the synthesis of personality structures within communities of shared interests.

The primary institutional expressions of privatism under monopoly and late capitalism is the achievement ideology or syndrome typical of occupational and educational hierarchies. It is action, grounded in the normative expectation of these institutions and projected through the consciousness of participants, that is geared competitively towards others. Communicative action of this nature is monological and produces essentially unstable normative re-

lations. Since strategic in orientation, this action has been, under earlier capitalist eras, instrumentally important to knowing and coping with the collection of economic and administrative values. That is, it represents in the argot of 'street wise' people 'playing' or 'knowing the system' (a common affliction, it is said of the legal profession). With shifts in the modes of surplus value extraction, and the access points to the privileged but parasitical, quasi-professional positions the secular form of privatism appears to be eroding in the organized societies. This has crisis-ridden implications at the level of the personality structure as well as at the political-administrative levels.

According to Habermas, there are "functional equivalents" for the replacement of privatism that as cultural contacts are politically and economically exploitable for purposes of legitimation. This means that because interaction patterns of contemporary social life, both interpersonally and institutionally, are 'shot through' implicitly with political contingencies that there is no generative base for the formation of true intersubjectivity and consensus-making. Privatism which has become an historical, parasitical deformity cannot engender interpersonal relations of equality or of shared interests. As a result even its evacuation plunges the experience of the everyday world into a further social anonymity. There are but a few remnants of marginal bourgeois culture that do contain traces of "communicative morality" (Habermas, 1975) which properly organized could become

counter-culture initiatives. I refer to the emergence of post-formalist art, universal ethics, and scientism of which only the latter is contributive as technical-productive force in economic accumulation. But these phenomena are best left to a later section.

What is particular about privatism and its implications for personal and collective praxis is its essentially negative relation to discursive will-formation or public discourse. When this is 'bolted' onto the expectational patterns of 'citizen duties' in the formal, anticipatory democracies, 'participation', in the organized societies, becomes a hollowed-out attentive but deferential affirmation of political-state elites' decisions. Habermas displays the work of Almond and Verba (1965) on political culture. They argue that the bourgeois formal democracies contain pre-bourgeois traditional world views as well with the effect that citizens are confronted with the hortatory rhetoric of participation as appearance while the access points for engagement or debate in de-centred forums are few or non-existent. This occurs, they would maintain, not through the accidents of systems complexity but that this particular admixture of political culture maintains the motivational force necessary to believe in the political theatre but insufficient for persons to take a stake for themselves in it. Even

...the free-floating politician of the mass party whose blustering rhetoric has faded away, today indulges in talk of statistics, the national economy and "inside stories". His manner of speaking has become prosaic and well-formed. He main-

tains an ostensible contact with the workers and expresses himself in export figures and synthetic materials. He knows better than the fascists and masochistically intoxicates himself with the facts, which have already passed him by. When one can no longer invoke violence, knowledge must suffice.

(Horkheimer, 1978, p. 113)

The sociology of education (Sarup, 1978; Karabel and Halsey, 1977) testifies to the roles of the family and school in socialization and the transmission of class-specific motivational structures (see Bernstein, 1975). In realizing curriculum intentions, pedagogy in mainstream state schools inculcates as a kind of sub-text the silent, but vicious cores of repressed consciousness and achievement syndrome; both essentially hand-me-downs from earlier worlds of work and culture. What school sub-culture either intra or extra-classroom cannot provide is a communicative organization of interests and hence a morality amongst teachers and learners that is anything but flexible-submissive and rule-centred.

When the political conditions of the classroom shift so do the dependencies of learners on 'second-guessing' the system's requirements. The achievement syndrome, the repressed conscience and 'knowing the system' contains consciousness in a non-reflexive dependency. Institutions are known so as to be manipulated so that more benefits flow towards the cynical mind. The derivatives, in consciousness, or purely, stripped-down bourgeois traditions offer no relief from estrangement or anomie. They lack the political motive forming power for students or citizens. As organized

capitalism becomes more chronic as a social form, these traditions are further hollowed out and their power to confer political legitimacy on institutional life is dissolved. Persons begin to displace their energies in backwaters of narcissism which are only too readily commodified. Resistance or the idea of it becomes impossible to identify when cultural traditions provide no auspices for wholeness, solidarity or intimacy with others. To attempt political work on any front is a monumental task.

It is an expectation of the achievement syndrome in persons that rewards are distributed in direct proportion to the work done or the excellence attained under conditions of equivalence. This applies as much to the labour sector as it does to mental production of students in schools, and the distribution of life chance opportunities within the social structure. Empirically and ideologically, the power of these social forms is dissolving as the public sees more evidence of a structural mismatch between school attainment and preparation on the one hand and occupational access on the other. Students and parents are becoming more self-conscious, too, about the obscure correspondences between academic success, social class, curriculum differentiation and school outcomes. While state agencies and schools try to secure ever more firmly traditional and bourgeois forms of personal evaluation and accountability in the popular consciousness (see Guide to the Core Curriculum, B.C. Ministry of Education, 1977) social research suggests that contingent elements exclusive of the professional vocabulary of progressivism

more closely predict school success, and socio-occupational opportunity (see Rocher, 1975; Richer, 1975). Considering that the swelling ranks of the unemployed can become a chronic structural feature (of close to 20%), in both organized and competitive sectors, the incongruence between achievement ideology and school outcomes, and the likely loosening of privatism as a normative organization of real force, does organized capitalism face serious reproductive deficits of meaning and legitimacy after the 'Third Slump'? (see Mandel, 1978 on the effects of the 1974-75 recession.) Curriculum planning clearly has a role to play in the formation of a practical response.

As we have seen there is a constant interchange of cultural elements between liberal-monopoly capitalism and the organized form. Typically, bourgeois ideologies, as they pass through the historical matrices of each phase of capitalism shed yet more of their organic, creative core until the point is reached at which they contain no potency in directing the communicative organization of the lifeworld nor in offering only political legitimation functions. Habermas (1975, 1979) notes that only three cultural forms that evolved, de novo, in bourgeois consciousness at present, can contain latent possibilities for critique and reconstruction; non-formalist art, scientism and universal morality. I will discuss only the final one briefly.

It was under the regime of bourgeois formal law that the legal and the moral realms of action were split apart

thus freeing, in principle, their normative contents from tradition. This allowed their contents to be determined intentionally in the light of the free market. Both realms were based on general principles freed of dogma and prejudice. In the case of law these principles were assembled on the idea of the "bourgeois private person" constrained only by the power of the state and the necessities of material nature. Morality in the liberal world view, sees the state intervene only to enforce passive proscriptions in society. Hence, control is achieved through the internalization, in consciousness, of the concrete citizen. Given the over-arching notion of equivalence exchange at the time this became a practice, by those citizens capable of it, of universal morality. The particularist civic duties of citizens and their enforcement was contrasted with the global moral reach of the person in the world community.

Under these social relations, never actually redeemed, the distinction between civic life and obligations, ridden as it was by power relations, and the progressive universalization of normative systems can only be reconciled by the dissolution of different interest blocs; that is, only if persons dispense with a we-they fortress-hordes mentality where the pursuit of personal interest no longer is taken as competitive-aggressive denial of the other person. This disjunct between 'privatized' and 'socialized' interests is reconciliable since it is historically and psychically well-sedimented only through the organization of discursive will-formation. Only in the achievement of rational con-

sensus over matters of public interest would legal action coalesce with morality. Citizens, under this organization, would be encouraged to accept the ethical procedural axis of the justification of any future principles of social justice or of distribution of values as they emerge in social evolution.

The problem for organized capitalism is that the 'memory' of this cultural fracas and of the historical possibility of practical discourse cannot simply disappear. In order for any conceptual or moral system to evolve, rather than to regress, presupposes an axiomatic relation to truth. This is given with the notion of the ideal speech act as the unseverable presupposition of the achievement of equality, justice and freedom. Truth as an historical construct gains its meaning as and in the continual transcendence of socio-political relations. Either social and curriculum inquiry can lose courage and hide behind the old, decayed forms of knowledge of redundant social eras or it can act as a motive-forming force that unites private and social interests communicatively and publicly in its projects. The choice of the privileged intellectual is his: to redeem an honourable vocation or to retreat to his common, civil service posture. For under organized capitalism there is a chronic need for legitimacy from spontaneous cultural contents that are readily appropriated by state-corporate interest. Ironically, these content traces although not usable to build mass alternative political or cultural

initiatives can form precedents as critical-practical collectives in art, in schooling, in political-civic affairs, and in science itself (despite the latter's philosophical degeneration).

A communicative ethics contained, as an experiential nexus, in communities of friends, of art, schooling, science and parenting could initiate new processes of socialization suitable for a post-capitalist, post-Marxist personality, interactive patterns, and social structure. The immanent ambiguity of these traces of bourgeois cultural traditions can either be purchased by dominant corporate-commodity logic and re-integrated into the tattered cognitive and moral patterns of the present or its promise of the secure, luxurious life can be refused. If the latter is chosen we join a loose union of resisters seeking that potential to universalise our identities cognitively, and morally; a task which I believe involves sustaining the dark side of crises.

CANADIAN SOCIAL AND ECONOMIC STRUCTURE

Since the demise of laissez-faire capitalism in western nations, there has been a corresponding consolidation and concentration of economic activity in increasingly fewer and larger economic institutions. The features of advanced monopoly capitalism and the effects of mass consumption societies have been widely documented, both in popular and in social science literature. If I proceed from the assumption that the forces and relations for production are

instrumental in conditioning man's social relations, then the implications for social and ideological control of men's behaviour are highly significant in the current historical stages of western industrial development.

In a nation state such as Canada, evidence indicates the increasing consolidation of control of major economic sectors is in the hands of a relatively small group of individuals of homogenous ethnic, political and social class background whom we may term a "corporate elite". The residue of aspirants to crucial decision-making positions in the major economic sectors, which are under indigenous control, can be found to be absorbed at less crucial levels of Canada's corporations. It is important to make a distinction in the sources of ownership within the Canadian economy at this stage. The bulk of the miniscule native corporate elite has control of the major economic sectors of utilities, transportation, finance and banking, and finally that of communications and media. (Ownership here is held by those typically of upper class origin, Anglo-Saxon ethnicity and of Protestant affiliation). Other major sectors of economic life such as industry and manufacturing, and resource extraction and primary processing typically, are controlled through multinational corporate and subsidiary penetration, of the Canadian economy, by American, British and other foreign ownership ties. To some extent the senior decision-makers and corporate elites in this area are of diverse ethnic, middle class Canadian background, but also include

foreign nationals and Anglo-Saxon ethnics of middle class background.

It is important to see the economic and structural influence that the finance, utility, transportation and media sectors have upon the national economy and to appreciate the relative preponderance such sectors have over the foreign dominated economic sectors. However, it can be documented that the working relationships between the indigenous economic elite and the 'installed' elite are by no means aggressive but are accommodating and self-supporting of a functional interdependence in national economic relations. (It cannot be said that Canada, however, is economically independent and politically dependent. Its participation is strongly grounded in dependent international economic relationships but can be considered to have national boundaries in a political sense.)

The foregoing brief description of certain Canadian economic facts of life hinges on our earlier assumption of the primacy and determinate quality of the productive mode. Given the fact that our major economic institutions are consolidated and controlled by a small upper class and the remaining sectors by an elite on friendly and interdependent terms with the former, I can argue that the current pattern of economic relations in Canada is maintained for the interests of a small, elite class. Indeed, the significance of the occupational positions of the middle classes has declined from the point of view of independent economic activity and

decision-making. The increased loss of an autonomous entrepreneurial way of life is accented in the advanced capitalist phase of the western nations. With the middle classes, in fact, I can discern the growth of a second propertyless, wage-earning class, wherein their chief economic function becomes that of consumption factors who are destined to implement low-level technical decisions and to monitoring-type tasks for corporations. As a result of such developments I can term the homogenization of formerly identifiable social classes into one dependent economic stratum, and underclass.

It is necessary at this point to take a closer look at the particular institutional interrelationships of the Canadian economy in order to discern some of the implications for social control of the underclass and with a view of how knowledge is instrumental for the overclass-underclass, dominance-dependence relationship.

At least within Canada it is possible to trace the sources of ownership and control in both the major economic sector and that of the communications-media complexes. Given the degree of rationalization and concentration found in the former, it is reasonable to presume that something of the same form of relationship would obtain with the media. In terms of newspapers, journals, radio and television outlets, I can identify control over communication content and dissemination to be lodged again in the hands of small elite groups who have increasingly close economic and political ties

with one another. Media forms in this country typically take on the nature of interrelated complexes rather than, for instance, elite ownership being only restricted to series of television stations or newspapers. Talking in crude terms, the extent of elite ownership is not limited to collections of different media forms that have been consolidated, but to joint ownership of corporations in the major economic sector. Thus it is conceivable that small groups of individuals can have joint decision-making influence over both economic and media corporations. Briefly, this pattern of ownership and control becomes, then, supportive of both spheres of activity and is instrumental in the kind and scope of information projected to the consuming classes. If both media and economic enterprises rely considerably on mutual reinforcement for each other's livelihood, then both corporate sectors are concerned about dispensing the 'correct' information to the underclass from which they must generate implicit consensus as to their respective ideas and products.

Clement discusses the overlap of the two elites and thus their joint social interests. "The mass media in Canada are class institutions run by, for, and in the interest of the upper class. More than that, they are instruments of the corporate elite because the media elite and the economic elite turn out to be the same people occupying the uppermost positions in two functionally defined domains of life in Canada." (Clement, 1975, p. 341). The further significance of this statement lies in the fact that, given this preponderant control over

public communication, the ideas projected through the media can be considered as the dominant ideology held by the upper class. This represents, as Clement argues, the major instrument for mental production in the country providing for a closed system of communication from upper class interests downward to the underclass. Claus Mueller (1973) comments that in mass industrialized societies, the closed, one-sided technical rationality of such communication results in the underclasses internalizing ideological knowledge as the only knowledge in circulation. Given the absence of alternative forms of discourse, potentially dissident groups have few symbolic resources with which to form counter articulations of their existential conditions; this results in distorted communication becoming generalized throughout the population.

It becomes appropriate at this stage to consider the form of knowledge that typically passes for communication and its related functions. Before doing this I must distinguish between popular knowledge disseminated through mass media and that of a more formalized scientific knowledge that pervades scientific communities. In terms of the latter form I am more concerned with the type of research knowledge that is contracted for and appropriated by industrial corporations and government departments.

The form of knowledge developed in research communities and taken over by government and industry quite clearly is of a type that is directed to improving productive capacity and to the refinement of techniques directed toward some end such as efficiency or the rationalization of varied technologies.

Hence, it is knowledge supported by the corporate sector and designed to enhance its quantitative growth and control. Seeing that such economic sectors affect the form of social relations of much of Canadian life, I must consider such knowledge forms to be highly valued by the dominant elites; this to the extent that corporate decision-makers, both media and industrial, would wish to convince other groups such as the underclass of its intrinsic value. Government or state elites in turn are clearly increasing their reliance upon the expertise of research communities. As Habermas (1970) indicates, one can see the beginnings of a technological determinism in the kinds of social and political problems selected by the state elite for solution. (That is, policies are to some extent formed in terms of the available technical solutions attached to them at the time; such political decision-making, it can be said, is in the absence of rational discussion with publics, whose social interests will be most affected by such solutions.)

The dominant ideology will then reflect an interest in technological rationality and in the application of such rationality to the solution of "puzzles" in the economic subsystem of society and ultimately, to a solution of the problems found in the socio-cultural life as well. The guiding interests of research and knowledge that are absorbed by dominant institutional interests are likely to be those of prediction, control, and efficiency. The dominant scientific world view behind such interests, I would argue, is that of

logical positivist science. To the extent that communication and the media are concentrated and dominated in Canada by a corporate elite, then the symbolic expressions, world view, and logics of inquiry disseminated to the underclass is likely also to contain these dominant assumptions. Members of non-elite groups are likely to seek explanations, and technical solutions to their local context problems in the light of these assumptions. The underclass represents for the corporate elite not only a vital factor in the productive process but also a collection of masses who must be persuaded to believe in a modified overarching ideology of technological rationality.

CURRICULUM ORGANIZATION IN THE SCHOOLS OF THE LATE CAPITALIST STATE

In the same sense that the phenomenon of economic rationalization appears in the corporate sector, with appropriate forms of knowledge to sustain this movement, there has occurred in the educational institutions an equivalent tendency towards rationalized decision-making and rationalized educational knowledge.

It seems necessary, first of all, to locate the educational sphere within the social structure of an advanced industrial nation such as Canada. Education cannot primarily be considered, at least at the public school level, to be an independent or autonomous institutional order in the sense that the industrial, financial or state sectors are. I could say that the latter are sectors controlled and con-

centrated by elites in which decisions are taken, policies are adopted and goals are formed that, in principle, affect disproportionate masses of people. These decisions are of such a nature that the affected publics have little influence in their development and outcome. The educational sphere is best seen as an institutional subsystem of the state sector. In most cases how an educational institution functions, both internally and in its outcomes is broadly determined by constitutional and administrative guidelines emerging from governmental authorities and departments; that is, it may be best put by saying, and, in reflection of present provincial trends, that many forms of educational activity are tolerated by provincial departments as long as it is confined within definite boundaries of practice that have been established hierarchically. A common thread running through all provincial systems of educational administration is the closeness that each governmental elite enjoys with corporate interests, either in the form of individuals having overlapping membership in both state and corporate elite or in the tendency for provincial receptivity to corporate and commercial lobbies, in the context of educational innovation and policy.

There appears a growing concern among public school educators, as reflected in their curricula and school organization, to explain or justify institutional activity in terms of a utility ethic. It would not seem unexpected for school officials to reflect the interests contained in a dominant ideology of technological rationalism. Given this

vital connection with the dominant institutional sectors of society, "educational institutions (are) induced to structure their overt motives in terms of the use to which knowledge can be put in the solution of material problems" (Esland, 1971, p. 101). It becomes rhetorical to ask which and whose material problems as the dependent nature of educational life predefines these as problems of the economic and state sector such as manpower needs, skills, flexible-general men-those with an implicit faith in the current structuring of Canadian society and its modes of conflict resolution.

As was discussed earlier, much of what passes for scientific expertise and research becomes transformed, at the corporate level, into technology, and as policy input, for the maintenance of the current social structure.⁵ At the level of educational institutions I can see a corresponding response in terms of knowledge organization for the socialization and control of school clients - the raw pre-productive factors of the economy. The educational institutions' response to the dominant technological ideology can be found in the selection, organization and distribution of knowledge as found in distinct school subjects. The latter can be understood as select symbolic universes of theoretical knowledge in which definite assumptions about man and his relationship to the world are found. Within the structure of a 'subject' are implicit methodological canons of inquiry; statements as to the proper data of the subject; and rules indicating the validity status of responses or outcomes ar-

rived at when one 'works' the subject. From this I will assume that particular conceptions of man, knowledge and society follow which to a large extent should be congruent with equivalent assumptions in the dominant ideology.

If I assume that the organization of the productive modes of a society has a determining influence on the institutions of the superstructure, which I will reconceptualize as the sphere of symbolic interaction (Habermas, 1970); and if, as can be documented, the existence of a corporate elite (Porter, 1965) can steer and control needs of the productive apparatus and consequently social relations in dependent institutions, then the requirements of a political-economic nature should seek to be partially addressed in the curricular organization of a school system. Curriculum in this sense would become "intentioned knowledge" leading to the control of pupils' consciousness and the internalization of a particular world view. The term curriculum as distinct from subject is understood as knowledge organized and realized in the minds of learners through an interplay of subject and pedagogical style.

There has been much debate and movement toward innovation in the field of curriculum theory and development (see Reid and Walker, 1975) over the last decade mostly in the United States and Britain, where practitioners in academic disciplines and in teaching fields have experienced a legitimacy crisis in the content boundaries of their fields. Much of the agreement of what formerly constituted the pro-

per subject matter of say physics, or anthropology or geography has dissolved. Once sacred subject divisions have become more porous and inclusive as each discipline attempts to incorporate content and questions belonging to formerly separate entities. Concurrent with this movement is a parallel "adjustment" of pedagogy, and changing conceptions on the nature of the learner, all of which suggest an orientation in the curriculum ostensibly different from past practice. Bernstein discusses the growing boundary openness, the emphasis on learners learning how to inquire and the pluralization of knowledge paradigms as stemming from several sources.

"...we could consider the movement towards integrated codes as stemming from a technological source" (Bernstein, 1971, p. 67). He goes on to suggest, however, that the sources are 'deeper' and that this movement "symbolizes that there is a crisis in society's basic classification and frames, and therefore a crisis in these structures of power and principles of control" (Bernstein, 1971, p. 67). While for the argument of this study, I would accept that there is a plausibility crisis in the dependent and semi-autonomous institutions and hence educational classifications and frames, this uncertainty only becomes severe with the classroom teacher who feels personal anxiety and professional disorientation. Furthermore, it would not seem that this reflects a crisis in the power and control structures of society but more a retrenchment and consolidation of economic and ideological power as capitalism reaches a more advanced phase.

At the same time as subject fields become more inclusive and internally diversified there is a growing rationalization of knowledge in other sectors. This may be understood, I contend, by the contemporary need for multidisciplinary solutions to complex macro-level problems. These solutions, particularly in the case of Canada, typically represent dominant sector problems such as national unrest from immigration or increasing regional inequities. The solutions to these problems, it seems, are more of the nature of requirements for system maintenance, while their often basic (i.e., the problems) structural origin is overlooked or masked by the pervasiveness of the dominant ideology. The latter's features, in the Canadian context, are a mixture of laissez-faire liberal sentiments, welfarist assumptions, and the explicit exhortation that technology has infinite social problem-solving capacities. (see Marchak, 1975).⁶

Curricular content and its realization should be fixed to these dominant societal symbols, but it attains its particular educational form through the mediations of the semi-autonomous schooling sector and from changes in the epistemologies of subject community and of instructional theory. As Esland writes, "These (influences) are the development of a subjectivistic and 'epistemological' approach to the human mind, and the 'ideologization' of technology, derived from economic rationality and political democracy" (Esland, 1971, p. 103). Given such influences upon curriculum organization in the schools I would infer that curriculum form would be

reflective of an instrumental rationalist ideology. The question of what scientific world view is represented by current curriculum paradigms is at this stage a researchable question. I would anticipate that insofar as insulated, structured contents are more likely to approximate positivistic world views, then innovation in the direction of pluralized openness in knowledge organization would be non-positivistic. A further question to be asked is whether such interdisciplinary approaches to teaching and learning are indicative of qualitative changes in the organization of schooling or whether we are viewing merely the rationalization of education knowledge?

IDEOLOGY, CRISIS, AND CURRICULUM IN CANADA

Let me return for a short time to the national and global contexts of the organized capitalist economy in order to illustrate how structural crises in the system dispose the state toward certain legitimation strategies.

Organized capitalism is characterized by crises that are not only economic but also political, ideological, and increasingly motivational. The degree of the generalized crisis is such that it has raised severe questions about the structure of social relationships underlying the pattern of capital accumulation. Such changes during the period 1965-1975 in North America included chronic tendencies of the rate of profit to fall, shifts in international capital investment, and natural resources pricing shifts. Additionally, this

period was one in which the state apparatus of many organized nations was threatened by the social movements, strikes, civil rights demands, liberation movements and counter-cultural initiatives. In all cases these collective protests, in a context of international capital shifts, affected the social hegemony of corporate interests in North America and Western Europe. Clear instances of an ideological crisis debunked the traditions of bourgeois culture that fixed a notion of work, consumption, family, and civic participation. Many counter-cultural initiatives in their diversity were united through a common interest in wholism, community life, self-integrity, and local devolution in a variety of life projects. Conventional patterns of production, consumption, and authority were consistently debunked; their once seemingly divine origins were revealed in their social class and historical particularity. Many of these utopian communal projects lacked the political organization to translate into enduring, practical relations. But the historical experience of those participations and observers was a significant first stage in any possible social transformation. Utopian experiments and the consciousness of situation and of class identity are necessary platforms on which to identify and formulate resistance to change that is anchored in the dominant arrangements of political and economic institutions. Clearly, political and cultural alternatives as idealized redemptions of capital labour contradictions do not in themselves instigate wholesale structured collapse of systems.

The tenacity of the political and ideological repression and co-optations of organized capitalist society so often emasculate such alternative social relations. While other factors, as this study suggests, must be considered for mass social transformations, the continuance of alternative political and cultural initiatives do contribute to the growth of crises on multiple fronts in national and global capitalist relations. The state is forced to attend to and rationalize these constant irruptions.

Because capital accumulation is characterized by its chronic instability, its potential for inducing social disruption is considerable. The North American economy experienced eleven major recessions during the period from 1860-1940 with the 1929-1934 recession being the most severe (Castells, 1980). This latter crisis was experienced throughout the world in its nascent global economy. From this point on economic and social recovery, so to speak, was achieved only through state-corporate intervention in the way of Keynesian policies. As I have argued before the social relations and modes of production of capitalism are a complex contradictory process which is only always temporarily overcome by corporate capital re-valuation and state programs. This intervention occurred historically only when the market mechanism became inadequate as a privatized distributor of socialized values, in other words, when the possibility of 'self-reproduction' of capitalist social relations was threatened. Activities such as cor-

porate co-ordination, investment, and interest policy directives have been directed systematically to control employment, inflation, fiscal crises, and conditions for profitability.

United States government spending, for instance, increased from 8% in 1890 to 39% of the Gross National Product in 1960. This is a figure exclusive of military-defense expenditures. Total spending as a portion of Gross National Product by government has increased from 12.8% in 1950 to 22.4% in 1970. Such expenditure increase is keyed into two of the primary functions of the state in organized capitalism: accumulation and legitimation. Expenditure to sustain capital development, and the state's presence as a collective capitalist itself has enormous impact on economic life. But in order to secure and sustain these investments and surplus value extraction, the state acts to legitimate the operations of the economy and the motivational loyalty of different classes.

In most organized capitalist nations, spending and intervention are related. Social capital spending is intended to stimulate and support accumulation. Social expense spending is intended to secure legitimation and motivation. The latter includes spending for institutions and programs that work to generate social integration such as welfare, social security, unemployment and so on, and institutions that secure order through repression such as the police, army, and the judiciary. Social capital expenses are directed to fixed

capital and variable capital. In the first money is funnelled into physical infrastructure such as transportation and technology, and into human aspects such as research and education. Social consumption capital means expenditures are funnelled into labour power reproduction, housing, schools and health services. Clearly, social capital and social expense spending (O'Connor, 1973) are both instruments of accumulation and legitimation and are also instruments by which school facilities, training, teacher education, and curriculum planning are developed. The primary interest behind this kind of social capital spending and consumption is the reproduction of labour, power and consciousness. Since the state, economy, and socio-cultural life become increasingly interdependent in this era and because of the developments in technology (in reducing and displacing labour costs), the expenditures and their respective functions for system integration are complexly interrelated. In concert with these tendencies the use of human consciousness and technical knowledge become increasing factors of production. Because of this private capital, essentially, begins to control the resources and decisions determining general social and economic life. Since social expenses in education, training, labour preparation and curriculum planning are not directly profitable to private interest, the state must assume responsibility for this human reproduction. The state is also faced with meeting the social needs of interest groups neglected by private capital and which could become points

of social eruption or discontent: Each of these are drains on the fiscal resources of the state which it has increasing difficulties meeting with revenue from a distorted tax base and surplus population (devoid of income). In this kind of social equation the interests of the state and particularly, monopoly capital are tied and bound together in what O'Connor (1973) calls a "social industrial" complex or the social management of capital recession and re-investment. The competitive or private, labour intensive economic interests in the economic sector must be buffeted by this play of contradictions.

How does the state effect from an economic-political standpoint two mutually contradictory functions yet maintain the 'integrity' of the system as a whole?

...the state must maintain or create conditions in which profitable capital accumulation is possible. However, the state must also try to maintain or create the conditions for social harmony. A capitalist state that openly uses its coercive forces to help one class accumulate capital at the expense of other classes loses its legitimacy and hence undermines the basis of its loyalty and support. But a state that ignores the necessity of assisting the process of capital accumulation risks drying up the source of its own power, the economy's surplus...(it) must involve itself in the accumulation process, but it must either mystify its policies by calling them something that they are not, or it must try to conceal them (e.g. making them into administrative, not political-economic issues).

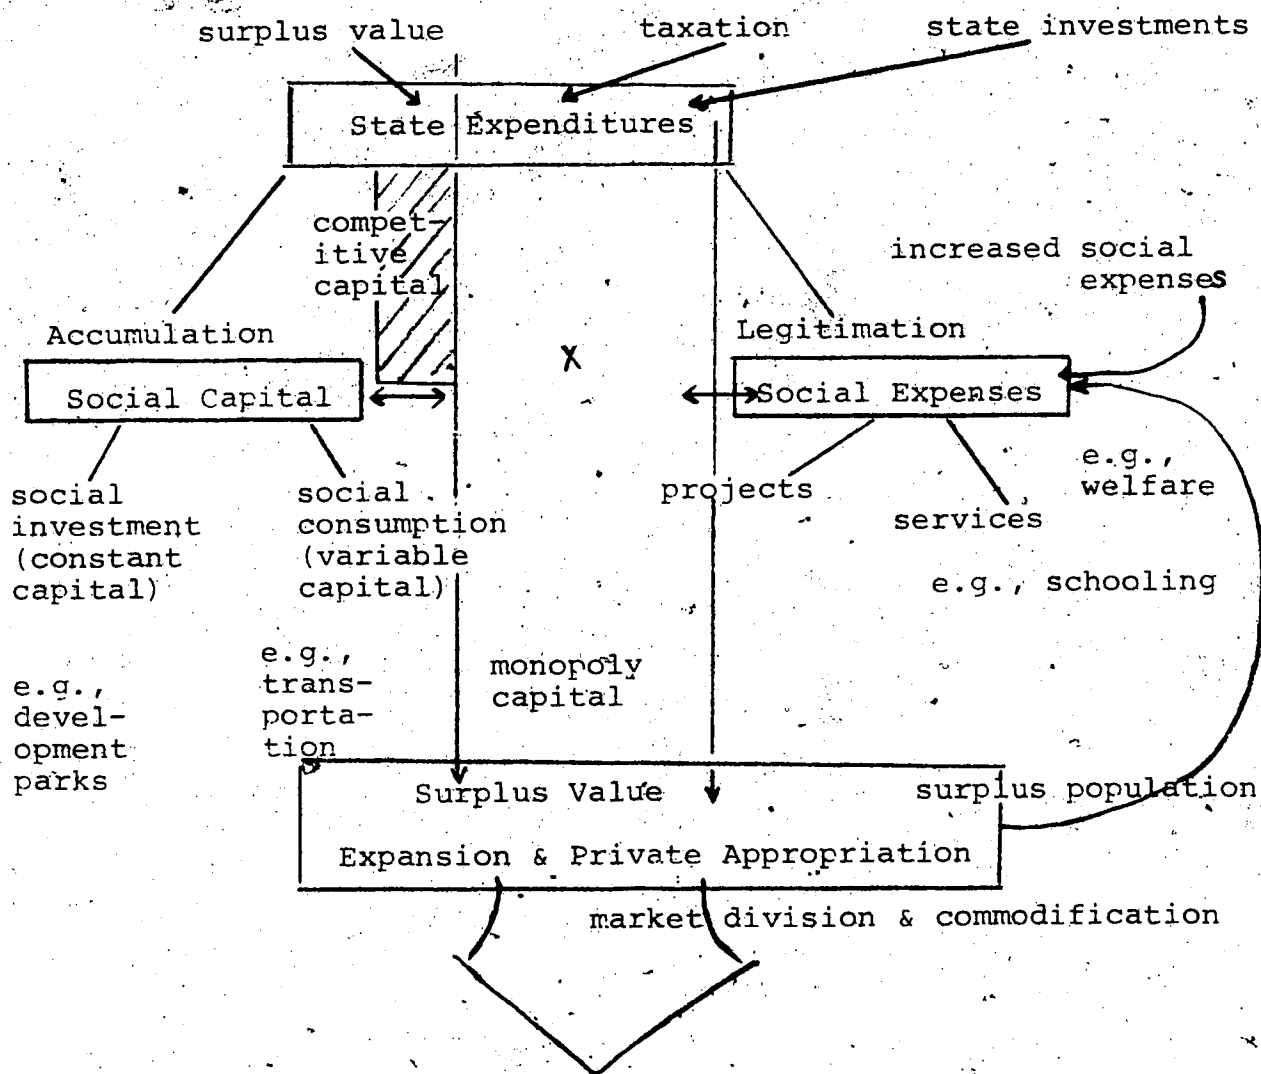

(O'Connor, 1973, p. 6.)

The 'structural urgency' for co-ordinating and sustaining these two state functions is conditioned by the fact that

capital investments and capital consumption is increasingly socialized over time as disproportionately greater shares of costs are shouldered by labour and taxation. One factor involved is this that such social expenses as education and curricular planning and other human infrastructure proliferate as indirect investment and control functions. They do, however, have a regressive effect on the strict accumulation of monopoly capital or private investment. As O'Connor (1973) points out, the expansion of monopoly capital as a social system relation is irrational because it provokes unemployment, market rigidity, price fixing and so forth. This leads to the constant deterioration of demand and hence diminishing returns on capital invested and commodities that are distributed. Equally, as an option the state and monopoly capital can pursue expansionist policies to stimulate demand, such as credit and money supply circulation; a policy however, which leads to inflationary outcomes, decline in purchasing power and ultimate decline of favourable markets in which to invest. Something of the latter scenario has been occurring in the Canadian economy in 1981-83. Clearly, any state financing of social costs such as stabilization payments and legitimation costs, results in a chronic disparity between expenditures and revenues with the ability to generate disproportionately more revenues actually eroding. Labour, organized and unorganized, and other interest groups each approach the state for compensations of different kinds. Each of these claims is processed in a political-administra-

tive calculus. Such claims are part of a larger political struggle, primarily latent in consciousness, but which may or may not be redeemed by the state. The interests contained in these claims are often contradictory with one another since social capital disposition and social expense are antagonistic dimensions of a wider struggle. 7

Illustration of Particular Structural Elements in the Accumulation-Legitimation Thesis

Currently, in organized capitalist economies the preparation of labour power and consciousness has taken on particular importance for sustaining growth and control over production.⁸ Scientific and technical developments play a vital role as factors of production (Habermas, 1970). Knowledge of this nature is increasingly displaying the craft-like specialty knowledge of the old working class. To inculcate and prepare labour power with the flexible, general-skills required in evolving production relations represents a substantially higher cost than in prior eras of manpower training. State-sponsored training programs, schools, community colleges, and universities are under mounting pressure to emphasize and supplement traditional curricula with vocational orientations. Lower-level technical training has seen an unprecedented expansion of students since 1945. This has involved the subtle transformation of many higher education institutions from liberal-arts or professional programs to ones that explicitly exploit technology. As the state gains a bigger stake in the financing of these institutions so their emphasis seems to shift to quasi-professional, technical administrative preparation of labour. Education and 'specialized' teacher-training programs show a remarkable shift toward the technization of pedagogy and its intrusion into socio-cultural and family relations spheres never before affected by processes of rationalization. This represents a distinct re-organization of productive relations under the organized economy in which capital

equipment (automated machinery) replaces living labour. Consequently the skills required for workers and their absolute numbers have shifted. There are massive training efforts at the technical, semi-professional levels which key the work process more to the organization and control of production than it does to the application of highly-trained craft specialities. Clearly, the interests here, amongst capital, are to rely far less on living labour, in the effort to extract greater levels of surplus value in more controlled, planful ways. This shift in production requirements causes surplus population to grow as a contradictory phenomenon. On one hand this allows greater exploitability and competitiveness amongst labour, when it is needed by industry, but on the other hand requires that its potential for social discontent be cushioned by increased state expenditure.⁹

The more that the state plays a role in the financing of educational provision and labour power provision, that is, as requirements of worker consciousness are more determined by the capital-labour constellation, then the more educational institutions are modelled upon a logic of efficiency and technical rationality. Career education, vocationalism, have become the curricular expressions of 'reform', 'modernization' and 'individualization' in school life. Students' academic careers, and personality characteristics, only make sense, if they are geared to 'marketable skills' whatever level of attainment is reached; from

secondary school to graduate school. Although program choice in schools and colleges appears to have multiplied the overwhelming organizational thrust is to 'tighter' teaching and learning arrangements, the rationalization of course offerings, and a 'return to repression' in schools.

A question that we return to repeatedly is how does the state in its organization of political rationality and legitimation successfully accomplish the twin contradictory functions of private appropriation, and the acceptance of progressive social 'immiseration'? Why is this antagonism not transparent to the mass of citizens? Wright (1978) argues that the introduction of Keynesian type intervention programs in the 1930's represented a durable precedent for the state to intervene more fully in legitimating expenditure. However, once state intervention is established at a general level through the presence of social services the 'benefits' that flow from these are institutionalized as expectations in popular thinking; in time these services become 'viewed as rights'.

Once a programme becomes seen as a right, the continuation of the programme adds little legitimacy (to the) state whereas a cutback... would constitute a source of delegitimation. There is thus not only a tendency for programmes once established to continue, but a constant pressure on programmes to expand, regardless of the requirements of the accumulation process... (in this situation) there is a tendency for unproductive spending to rise more rapidly than the requirements for realization of surplus value.

(Wright, 1978, p. 158)

How does the state accomplish the ongoing representation of social-political life in such a way that popular participation runs the society, that technical-rational thinking is the cultural panacea for all social problems, and to disguise the fact that constellations of state-corporate alliances as expressed in a social-industrial complex disproportionately determine policy of non-generalizable interest for the society as a whole? I have discussed a number of cultural and socio-psychological factors that are important in maintaining political mystification in the "talking shop" society of formal democracy (see Lenin, 1964, pt.1).

Habermas (1975) indicates that of the remnants of bourgeois cultural traditions still present in popular consciousness under organized capitalism, it is scientific technical rationality that displays a most contradictory position. On the one hand, it has been duly credited in liberal and neo-Marxist (see Bell, 1976, Schroyer, 1973) writings on post-industrial society as having the power of an overarching ideological totality - a logic of meaning and organization that has tended to overpower and nullify other forms of cultural and political initiatives on a massive scale. On the other hand Habermas argues that scientism, as an intellectual derivative of this ideology has powers of critique and analysis that allows it to be teamed against its own formulations in a self-criticism. I will not develop this half of the contradiction of scientific-technical rationality presently. Instead, I will characterize how this cultural

tradition is rooted as a world view formally and popularly in consciousness and how it is this kind of cultural appearance that radical inquiry and popular initiative must recognize, as one front of repression, in their projects of resistance.

Scientific rationality operates on one plane as a process of reification. In its commonsense reception it is seen as a presence completely independent of human decision and judgement. The distinction that human science makes between natural and social history is obliterated. Labour and interaction dissolve into one another, even for Marxists, in the technological determination of human projects. The argument draws upon the belief that the technical derivatives of this rationality supplant both redundant manual labour and inefficiency in administration. The base of private social interests that power this kind of calculative organization are severed from reflective critique. The accidents of history, class interests, and the prejudices of the current social order are all transcended within the scope of its mystification.

It is rarely considered how scientific-technical rationality is expressive of both a partial rationality and an over-arching or universal irrationality. It is used as a calculus of decision-making in organizations and economic policy for its spurious claims of precision, predictability and control over social processes. As a popular apologetic it becomes stridently anti-intellectual arguing that

intellectualism is part of the traditional and redundant relations of social ignorance that have kept the working classes from participating in the good life. Scientific rationality as a long-term organizational logic demonstrates its irrationality by its neglect and inability to account for historical evolutionary eruptions and movements of resistance. As a particular historical emergence itself its practitioners forget its roots in the bourgeois revolutions. Hence, through its systematic amnesia, it suppresses the practico-creative forces of a society as the only practical, organic possibilities for evolution of the species.

In its applied analyses of organized capitalism scientific-technical rationality presents itself as the only perspective that can reconcile the capital-labour antagonism. It is often the language of negotiation and resolution in organized labour negotiation, and in the justifications used by the state in response to public interest pressure. The organization of 'modern capitalist' production incorporates but does not integrate the person at his place of work. It serves under a plethora of 'benefits' and 'rights' to estrange persons from their work in the production of alienated, non practico-creative labour. Scientific-technical rationality appears in popular expression as a imminent form independent of living persons - and hence powerfully compulsive as an existential facticity - rather than as a complex of social relations. 'Perfectly rational' calculations made by capital groups on issues of investments, or labour cost

reduction, in the short term historically have led to overproduction, declining profits, dwindling demand, and reserve pools of unemployed in the long-term. Specialization and expertise in these contexts of decision become the new form of philosophical blindness and amnesia of the age. Each of these dimensions of scientific-technical rationality are directly transposable to the conduct of organized schooling and curriculum planning as means of mystification and legitimation of the dominant social order.

If I examine the recent developments in the curriculum of two subject areas (see Stevenson and Wilson, 1977) in North American public schools, the above considerations become more significant for this study. In the area of reformist or public issues social studies education, there has been, within the last ten years, a broadening of what counts as valid knowledge to be transmitted to students (see Wright, 1978; Meyer, 1976; Michaelis, 1976). Particularly at the secondary level, curriculum shows a concern for broadening its conceptual base to include most of the social science disciplines (see Barr, Barth, and Shermis, 1977). Included in courses of study are themes and activities dealing with social problems of Canada and the United States such as multi-party politics, questions of ethnic prerogatives and multicultural policy, down to the question of foreign aid increases and so on. Additionally, these curricula stress activities designed for values clarification and for development of consistent, defensible ethical positions on the part of pupils (see Fraenkel, 1977). Such

features reflect contemporary developments in curriculum, instruction and schooling and fulfill much of the pluralist, integrated criteria as 'nurtured' in the United States and Britain (Warwick, 1973; Haigh, 1975).

Secondary science programs have undergone similar changes in which, as the documents term it, there has been a "humanization" of science teaching and learning. Indeed many of the science program features are noteworthy: to promote an awareness of the humanistic implications of science; to develop a critical understanding of current social problems which have a significant scientific component (who determines this?); to develop working attitudes similar to 'real' scientists; to familiarize students with the role of science in the development of societies; to develop competence in the skills, attitudes and methods of 'science'. Interestingly enough in the assembly of process skills and conceptual objectives of course of study, it is usually only the methodological features which are given any pedagogical scope.

Science programs (see Alberta Department of Education, 1972) formally fit the prototype of integrated organization but in their essential 'bones' do not actually reach the integrated designs of social studies programs. I suggest, that even in the absence of content analysis trends, science curriculum in many Canadian provinces, at present, is representative of a positivist world view and directly translatable into a technological consciousness among students. The social studies program in Alberta (1981) at present (expresses' the vocabulary and motives of a quasi-historical-

interpretive world view and could indicate a practical interest in understanding features of the larger social structure. Intuitively, the social studies program provides signs in its design (cognitive-affective separation, e.g.) which suggests it comes from an epistemological community that works through a strict-exact conception of science and, in particular, of social science. Both trends in curriculum design, I would propose, are fundamentally supportive of a dominant ideological tradition of Canadian society; both would serve to maintain faith in the increasing ability of technology to 'solve' our pressing complex social and political problems; both designs will act to invalidate questions of radical strategy in dealing with regional and class inequities in Canada; and both could represent forms of science that can occlude such inequalities and, in fact, function indirectly to perpetuate them. Under the pedagogy implied by these two curriculum approaches, social control becomes, implicitly, more extensive through the effects of an intrusive, personalistic socialization. The socialization function is accentuated in a design based on the appearance of historical-interpretive science.

Other implications that I feel follow from: 1. the operation of curriculum development of logical positivist orientation, 2. which is based in a bureaucratized public school system, 3. located in a nation showing particular regional structural inequalities, are:

- (a) development and institutionalization of a scientific method, which when generalized to an every-

- day orientation scheme will tend to maximize personal and social qualities that legitimize inequalities of condition and opportunity in Canada;
- (b) which will lead to increased rationalization and bureaucratization of decision-making in schools despite official rhetoric about local decision-making and devolution;
 - (c) growth of a totalistic ideology at the macro-institutional level; growth of professional closure in the rationalizations and vocabularies of intent given by teaching personnel.

My general conclusion (is) that the conditions of organized capitalist societies simultaneously generate new possibilities for such a strategy and recreate obstacles to any attempt by socialist forces to use the capitalist state. The decisive task of any socialist strategy is to grapple with this intensely contradictory situation, rather than to ignore the contradictions in the polemical defence of a specific choice.... Ruling classes do not rule by hegemony alone; they also rule through domination. An attack on the ideological hegemony of the bourgeoisie will not create a socialist society unless it becomes translated into an attack on the domination of the bourgeoisie. The strategy of using the capitalist state to destroy the capitalist state is implicitly an argument about such a possibility. To argue that structural changes within the capitalist state can facilitate a strengthening of the organizational capacities of the working class(es) is to argue that it can make such a challenge to bourgeois domination possible... (if) such a process leads to a qualitative transformation (destruction) of the class character of the state itself (then) a new type of state structure is established which can function to build socialist relations of production rather than simply undermine capitalist relations. Such a transformation represents a revolutionary break with capitalism.

(Wright, 1978, p. 232, 249)

FOOTNOTES

1. Habermas (1975) notes that in order to warrant talking about the "social contradictions" that underly this kind of capital-labour assymetry we would have not only shifted the truth or empirical contents of our statements about society we would also have to practice a communicative action in members' speaking and acting recognizing these empirical shifts, not then a logical shift per se. This has implications for the role ideology plays in organized society since if opposing interest groups do not recognize their claims as fundamentally incompatible then the extent of their conflict is not expressed. Ideology in liberal capitalism successfully conceals the skewed chances for the legitimate satisfaction of contending interests. In fact this represents a case of repressed communication which is served to forcefully sustain a system integration of the society. Rather than being considered as a structural antagonism conflicting parties discrepancies are seen in individual terms as arbitrary schedules of preferences.

It is under liberal and monopoly forms of capitalism that the social class structure as a central mediation is more visible. In these two cases the basic conflict is displaced onto the market mechanism - where a political problem is transformed into an economic one. This is a systemic problem which is distinguished by its flamboyance, the utopian hopes of labour and the moral fears of capital. Liberal-monopoly capitalism is typically a society ridden with economic crises. All eras of capital formation have been marked by periods of retrenchment and devaluation. This is experienced as the business cycle of recession and buoyancy with the attendant social outcomes. The internal structure of capitalist development follows the growth of capital and social wealth through progressive extractions of surplus value. The latter has typically been secured through technical developments that are capital intensive. With each retrenchment of capital formation the organic composition of capital (Marx, Grundrisse) shifts with an increase in fixed capital at the expense of variable capital (labour costs or wages). However it is only through human labour that surplus value occurs at all and can be progressively extracted. But this trend in effect represents the tendency of profit rates to fall and the disinclination to continually invest capital. Mass purchasing power (labour) in this equation is vital for capital realization yet real demand can only be sustained by the progressive yielding of surplus value to labour to purchase. Labour "costs"

are stripped incrementally of this accumulation. In such circumstances capital has not returned to its "owners" what it might; there is a corresponding disinclination to invest. The social outcomes of this phenomenon are what we experience presently: unemployment, small and medium business failure and state manipulation of interest rate structures, among other things. This dialectical relation between societal members represents an insoluble contradiction. In traditional societies this consciousness is mediated through magical or other non-rational consciousness. Liberal society mediates this conflict through displacement to the market mechanism - an institutional illusion 'freed of power.' In organized capitalism although economic crises are not typically systems threatening they do result in crises projected into a range of institutional subsystems. In each social formation the conflict is made opaque and the chances of (critical) reflection upon it are destroyed. Clearly, certain ideological devices remain from pre-bourgeois, and bourgeois periods of capital formation; namely equivalence exchange, commodity fetishism, individualized group conflict, universal achievement sentiments etc. However, under organized capitalism the nature of the displacement is different, the nature of communicative domination is different, the forms of market division and extension shift, as do the possibilities for renewal in surplus value extraction, technological developments, and hence the likely strategies for resistance. In short, major features of capitalist social formation change in the organized era.

2. Habermas, in *Legitimation Crisis* (1975) discusses the work of Keniston, in *Youth and Dissent* (1971), wherein the resolution of adolescent crises by some youth signifies a socially progressive outcome. Keniston shows how certain types of youth are able to stabilize critical-reflective perspectives on the links between their identity formation and dominant cultural interpretations. He shows how youth through a variety of conventional and non-conventional auspices exhibit what he calls either a "retreatist" syndrome or an "activist" syndrome. The range of possibilities for coupling these cultural energies to universalistic role organization is real.
3. See a variety of positions such as D. Bell, *The Coming of Post-Industrial Society*, 1973; A. Touraine, *The Post Industrial Society*, 1971; J. Ellul, *The Technological Society*, 1965; L.G. Neuberger, "A Critique of Post Industrial Thought," *Social Praxis*, 3:1,2.

4. The notion of the tendency to encroachment of total administration in advanced industrial nations is discussed at length in J. Habermas, Legitimation Crisis, 1975.
5. See H. Rose, S. Rose, The Political Economy of Science, 1974 for an analysis of the ideological functions of natural science knowledge production.
6. See P. Marchak's analysis of the range of ideological traditions in Canadian political culture. Ideological Perspectives in Canada, 1975 especially chapters 1, 2, 3.
7. O'Connor (1973) notes that as political economy policy tries to control inflation and investment crises the state is faced with three major options. Firstly the state can construct and manage a version such that capital can be ultimately revalued. Secondly, a price and incomes policy can be installed across the society with certain key groups exempted. Thirdly, the state in alliance with monopoly capital can try to increase productivity, sector by sector, through technical innovations, and overexploitation ('speeding up work' and lengthening the working time) so that labour costs and state revenues are supplemented. Organized capitalist societies practice all of these options in various combinations.
8. "Defense, education, health and hospital, police, and corrections outlays at all levels of government increased from 1955-1960 to 1965-1970. Defense spending increased 16% between 1955-1960 and 53% between 1965-1970. Education expenditures rose 57% between 1955 and 1960 and 80% between 1965-1970. Increases in health and hospital, police and corrections expenditures during the same period were 60 to 91% and 53 to 79%, respectively." (O'Connor, 1973, p. 98-99) education, health and manpower, and housing and community development increased most rapidly. However it is military spending and income maintenance that are the largest items in the budget and which increased considerably. These figures, although assembled for the United States for a 15 year period mirror the trends in Canadian state expenditures for a similar period. (see Perspectives Canada III, 1980, p. 111, 113, 123). These trends indicate the increasing reliance on state spending in the areas of social consumption and social expenses as instruments of indirect capital valorization and social legitimacy. The pattern of spending also indicates the complex, functional interdependence between securing accumulation conditions, stabilizing these politically, and absorbing

the possibilities of mass dissent and motivation deficits in the population.

9. Leo Panitch, in a recent public lecture (February, 1983, Fredericton, N.B.) provided an analysis of recent capital-labour relations under the Canadian state of the 1980's. He claimed that we were at an "end of an era of industrial relations in Canada" - one that originally signalled free collective bargaining. Under the recent Bill C-103, of the federal parliament the state has shifted in its tactics of reform. Although expressed as reformist ideology, Panitch maintains that the Bill contains the means for suppressing labour in a logic of consent and coercion. The era of the granting of free collective bargaining and universal suffrage has drawn to a close as capitalist hegemony is re-entrenched in a time of fiscal and legitimacy crisis. Legalized consent through this shift in legislation, becomes one new form of incorporation of labour. The state is granted more scope in discretionary coercion and the abrogation of guarantees of right to strike, legal contract recognition, and statutory income policies (1975). Paradoxically, the new 'particular' ideology of the state is voluntary in appearance but in essence engineers legal consent and rationalizes coercion. Unions have been exceedingly respectful of this and similar legislation declining to participate in 'Charter' negotiations for instance. Years of practice at legalism have taken their toll on a leadership which has tended to 'police' their members more than anything. He argues that with the 'failure of social democracy' left groupings must change the discourse in this country and develop a new language of politics.

PART III

RECONSIDERING SOCIAL STUDIES AS
HUMAN PRACTICE

Finale.- The only philosophy which can be responsibly practised in face of despair is the attempt to contemplate all things as they would present themselves from the standpoint of redemption. Knowledge has no light but that shed on the world by redemption: all else is reconstruction, mere technique. Perspectives must be fashioned that displace and estrange the world, reveal it to be, with its rifts and crevices, as indigent and distorted as it will appear one day in the messianic light. To gain such perspectives without velleity or violence, entirely from felt contact with its objects - this alone is the task of thought. It is the simplest of all things, because the situation calls imperatively for such knowledge, indeed because consummate negativity, once squarely faced, delineates the mirror-image of its opposite. But it is also the utterly impossible thing, because it presupposes a standpoint removed, even though by a hair's breadth, from the scope of existence, whereas we well know that any possible knowledge must not only be first wrested from what is, if it shall hold good, but is also marked, for this very reason, by the same distortion and indigence which it seeks to escape. The more passionately thought denies its conditionality for the sake of the unconditional, the more unconsciously, and so calamitously, it is delivered up to the world. Even its own impossibility it must at last comprehend for the sake of the possible. But beside the demand thus placed on thought, the question of the reality or unreality of redemption itself hardly matters.

(Adorno, 1974, p. 247)

CHAPTER 7

THE NOTION OF PARTICIPANT ENLIGHTENMENT

It may be useful to glance at some of the first level implications of the emancipatory interest of critical reflective inquiry for curriculum planning and evaluation in reformist social studies teaching. A liberal conception of curriculum definition, by Stenhouse, may provide an unwitting lead for developers and evaluators motivated by a critical social studies interest:

A curriculum is an attempt to communicate the essential principles and features of any educational proposal in such a form that it is open to critical scrutiny and capable of effective translation into practice.

(Stenhouse, 1975, p. 4)

Although we may impart broader significance to the terms critical and practical because of the assumptions of the earlier discussion, it is felt that the preceding quotation logically implies the use of a conception of pedagogy in which development is unified with evaluation. It is suggested that these two basic activities, typically associated with aspects of program administration, should be seen inseparably in continual mediation, and under the control of the students and teachers affected by formal program intents. Essentially, the important task for the future that awaits critical analysis of the curriculum is the specification of a set of properties, following these propositions, which

will serve as the analogue to a critical model of educational development and evaluation for social studies teaching.

The fostering of a critical interest in social studies education curriculum planning and analysis can begin to establish the connections with the everyday social world of student concerns, issues, and queries which hitherto have not been broached as valid program content. The problematizing of the everyday world, as a means towards a critical citizenship, can lead to the development in students of 'critical social learning skills'. This represents a broadening and deepening of a typically narrow technical notion of pedagogy (based on theories of cognitive psychology), by students collaborating on stand-taking, and through resolution and engagement with remote global issues or, community political developments at 'home'.

A critical model of social education curriculum would conceivably orient students to deal with or understand and overcome constraining forces in the school environment and the world of adolescence. Such a critical model of social studies practice incorporates an illuminative knowledge dimension at the same time as it accomplishes an evaluative function. This occurs to the degree that students are able to overcome or alter undesirable social relationships in their cultural milieu.

Forms of knowledge, generated by a synthetic critical interest, do not direct the student to anomic, tyrannical behaviour, or as Newmann puts it, for purposes of status-quo

entrenchment. Due to its status as a theory of knowledge and of society it implies a particular and 'authentic' normative commitment to renewed social forms. For this reason, discourse within an emancipatory knowledge code (see appendix 1) presupposes a transformation of socially redundant structures confronting a community.

On the basis of this perspective, students confront more meaningfully and practically the competing claims of diverse ideologies found in any complex social system. In this sense a 'critical social studies' could mean, albeit prematurely, literacy with action (see Calfee and Drum, 1978). It may mean unearthing or realigning the basic meaning and action implications of competing value complexes of a society. This would be opposed to a mere social arithmetic of the determinate conditions of social phenomena usually listed as topics of study in conventional curriculum guides.

It is often found that in the so-called controversial issues programs or the social problem orientation (Muessig, 1975) that teaching and learning is reduced to identification and descriptive analysis of topics of great public and global concern. The social arithmetic, in question, will often involve an interdisciplinary survey of the context, history and portents of teacher-based or course of study-determined problems. One variant or another of a scientific-based social inquiry model is the typical, but essential, pedagogical framework for classroom practices (see Muessig, 1975; Massialis and Cox, 1966; Raths, et. als, 1966; Fenton, 1967; Oliver-Shaver, 1966).

Palpably absent is the embodied sense of application or visible political outcome such as community projects, school or neighborhood-based protests, petitions or voluntary participation.

The sense of 'critical social studies' I hold here implicates a form of pedagogy that goes beyond the phases of description and understanding of social problems. We have seen, through the earlier analyses of program documents and statements, the presence of kinds of rhetorical discourse in social studies design that are often spurious, misleading and overextended in the types of practical and ideological claims they can make securely. Good and telling examples of this problem are the unclarified conceptual and practical differences associated with the use of critical thinking. Two statements allegedly addressing the same problem tradition in social studies teaching can be found to have polar connotations regarding curriculum planning, classroom practice and human learning patterns. Morse and McCune (1971) have developed a handbook sponsored by the professional association which provides teachers with resource items for testing study skills and critical thinking. Their monograph includes test items for central issue identification, reading-graphs, drawing inferences and other elements almost exclusively concentrating on intellectual-cognitive operations. Berlak (in Shaver, 1977a) in a bulletin also sponsored by the national council offer an alternative conception of critical thinking that is inclusive of developing reliable intellectual skills. Their conception, with a well worn social and philosophical tradition behind it, supplants the essentially psychological

orientation of the 1971 N.C.S.S. bulletin, with an extended notion of critical thinking that incorporates social and practical criticism of biographies, intellectual traditions and the body politic. Whereas the cardinal sign for critical thought for Morse and McCune (1971) is the ability to think logically and consistently, in itself, Berlak and Shaver suggest that ~~critical~~ thought must involve not only logical process but a critically-reflective awareness of one's traditions, self-formations and normative thrusts to the future.

Both positions receive quasi-official sanction from the professional body yet the historical and ideological confusion arising from the lack of stipulative definition for these terms remains unacknowledged and unclarified. Often what results is a naïve, rhetorical posturing of flamboyant 'buzz words' reminiscent of the crisis of meaning in curricular theory. Here, the prevailing belief is that if stock phrases borrowed from alien disciplines are used frequently enough, the latent practices that are implicated will merely materialize in the formerly musty crucibles of program development or evaluation.

In social studies, too, practitioners have an obligation to acknowledge their historical indebtedness to traditions of psychology, sociology and philosophy that often spawn the constructs used in different approaches to social education. In time, this acknowledgement means a recognition of the earlier human practices that grounded these conceptions and with that a common thrust to restructure their own inquiry, teaching and development relationships along lines less politically and ideologically quiescent.

Fortunately, for social studies educators there are marginal groups engaged in the cultural and historical archeology required to address structurally the questions of citizenship education. A particular point of disarray in the field concerns our unclarified assumptions regarding the curricular role of social studies in citizenship. For my task, in this paper, there is some warrant to Shaver's comments pertinent as they are to the sycophany I sense in social education:

There is little evidence to indicate that the schools' citizenship education efforts have affected generally the quantity or quality of adult citizen participation, and social studies programs and school environments often appear to be inconsistent with the demands of "adult citizenship".

(Shaver, 1977, p. 44)

Foshay and Burton (1976) in a seminal statement of this crisis are not unkind in displaying the mottled, confused career of citizenship as a central aim in the social studies. For them it has ranged from a naive jingoism, noble patriotism, to "New Dealism", war participation and onwards to the land of performance criteria and behavioural objectives. Through different historical distillations, we can arrive at a composite notion of citizenship which

...refers to feelings of affiliation with the country, loyalty, patriotism and (for my interests) the disposition to take an active part in governmental affairs....

(Foshay and Burton, 1976, p. 4)

Recent developments in social studies have begun to emphasize a renewal of our inquiry interests in the program

possibilities associated with critical-practical competence in citizenship (Gleeson and Whitty, 1976; Van Manen, 1975 ; Newmann, 1979; Freire, 1973). This conception of what I will term a critical citizenship for social studies is practice concerned with justness and action. It springs from a crisis in the social disciplines and a wider cultural crisis of social disillusionment and disaffiliation of group feeling. The view of social studies that I expound approximates "citizenship as all those activities that seek just relations between individuals and social institutions" (Rawls, 1971). Programs mobilized by this critical-moral interest will have recurrent ideal typical content and methodological features. At the level of a general philosophical world view, emphasis upon a deep evolutionary knowledge of our institutional past combined with provisions for direct practice in institutional construction and modification would be seen as axial features of a social studies for critical citizenship. Rawls' legal theorizing suggests that with the development of liberal and monopoly forms of capitalism, and the consequent dissolution of an organic moral tradition, institutional life must be explicitly assessed according to its degree of justice. For the administration of such school programs and for the contextual materials used in content the justice index becomes the over-riding consideration with all organizational, pedagogical and political questions of efficiency and technique. In this critical tradition of social studies the general desire for justice limits

the pursuit of other ends forming the basis for a reconstituted conception of citizenship. Such proposals grounded in the belief of openness in environmental improvement and in the improvement of access to the practice of justice clearly involve dissent and criticism as integral moments of teaching and learning. The task for social educators is to incorporate these moments within a program. Within these terms all critical social studies courses require a radical restructuring of their ongoing social relations for qualitative changes to emerge.

Traditionally, in critical social theory public actors or citizens have been assigned a role in which the obligation and responsibility to participate rationally and discursively in public affairs has arisen from the very structure of bourgeois society and its historical speech communities. That is, the individual citizen living and working in this societal form is immersed within a political culture that sanctifies participation, individual dissent, and freedom of conscience bound within a regulative framework known as the rule of law. Furthermore, it is taken as an ontologically human feature that individuals and groups are destined by a species-given responsibility to continually seek alternative social forms that would lead to progressive changes and improvements in their collective and individual existence. More recently, social theorists have referred to the struggle for equality of condition and opportunity (Clement, 1975).

One element of this species-given disposition toward emancipatory socio-cultural institutions is the form of discourse and speech practices members of human groups use in the construction of world views, ideological beliefs, scientific and other symbolic communities (see Habermas, 1971). Human speech communities, at least in advanced bourgeois societies, have been shown to be under siege by the growth of technological-productive relations which are successful in displacing the operation of the spontaneous and discursive lifeworld forms back onto the family, and possibly the school. They become dominant forms of rationality in those societies. The tradition of critical social philosophy which partially informs my conception of a critical social studies of citizenship attempts psychologically, culturally and politically to rescue the remnants of a public discursive, debating sphere of relationships (Markovic, 1974). Practitioners within the tradition operate with an idealized structure of social and linguistic relations which they feel each of us individually and collectively can attain given particular political structural changes in the larger society. Such practitioners are closely allied ideologically with educators committed to developing educational analogues from the hypothetical-structural ideal of communicative competence (see Habermas, 1971; McCarthy, 1978; Hymes, 1974). Integral to this idealized notion of a communicating, competence-seeking, reflective public are implications not only for social reconstruction but for

social studies curriculum redevelopment within a critical-practical tradition.

Citizenship in this view suggests a pre-constituted image of human responsibility. It presupposes an individual and collective responsibility for public communication, debate and realization in consensual communities (see Newmann, 1979 for examples of these communities) of world views and values that contain images of the good life and the good society. My interest is to begin to specify some of the pedagogical and curricular properties such a conception of citizenship implies.

Newmann, in a long series of positions stretching over a decade, has argued for the importance of the community setting in situating formal educational programs. The case for the learning potential of the community hinges on several factors among which are the motivational incentives for student learning, (Newmann, 1967, 1970, 1975, 1977, 1979) the opportunities associated with non-institutionalized 'space', and the service, vocational and citizenship activities students are able to pursue.

My interest lies with the conception of citizenship that is portrayed here. Newmann, Rawls, Johns and others have taken the political and moral ends of formal education programs to be concerned pre-eminently with the practice and redress of social justice. Democratic political culture is committed ideologically to a form of social learning embedded in workplace relations and within civic and public par-

ticipation. The tradition of political consent and a recognition of the personal exigencies of modern corporate life suggest a form of pedagogy for social studies citizenship that prepares for participation in community life. Yet, we may well ask, what community and what life?

Clearly, contemporary social relations in advanced industrial society militate against any of us experiencing in pristine form the primary organic bond of the small community. We cannot distance ourselves easily from the intrusiveness of relations based on urbanization, specialization, and a fragmentation of consciousness generated by corporatism; that is, except by quietistic retreat to a hermetic life. In this sense each of us as students, teachers and citizens confront in our everyday experience types of social relations from both the community and societal orders. Any form of critical citizenship must begin to recognize the dual forms of social relations citizens in these societies encounter on an everyday basis. Pedagogy for critical citizenship recognizes at least two traditions of possible civic participation in modern corporate life. It also recognizes two conceptions of social justice. Each conception of participation suggests an image of the good life and the kinds of normative commitments citizens should strive towards. Newmann terms those traditions of political culture the "participatory idealist" and the "elitist pluralist". Each of these represents a set of historical mechanisms that have evolved for distributing symbolic and economic power, influence and privilege to those living in the primary and corporate forms of social life.

Critical social studies oriented to the political and existential realities of modern corporate life (recognizes) a two-level concept of citizenship generative of learning experiences at the primary community level and at the level of the macro-society. This is a kind of pedagogy that operates with a curricular orientation toward direct practice at the local community level where experiences in self-governance are pragmatically accessible. It also operates with a reconstructionist curricular orientation at an institutional level where more formalized advocacy work is required in the effort to pressure elites. Considered in another way the structure and content of pedagogy is determined by an intricate mediation between the biographical and historical dimensions of the lifeworld. This critical form engages in the analysis and cognition of social issues concurrent with reflective participation. Global national issues receive analysis and macro-resolution concurrent with the students' involvement in unique local group concerns. The school's role is to construct learning parameters for students that resonate and depict the community and societal orders of experience. Students could be expected to observe and participate in numerous organizations or "mediating structures" that stand between the private self and the public corporate form. Such instances of family, neighbourhood and voluntary associations provide the opportunity for experiences of local world-building so important for that sense of personal efficacy and competence individuals require. Yet

students through this involvement will likely come to deeply appreciate how the macro-institutional relations tend to encroach and suppress the vibrancy of community life and decisions. With that weight there is the recognition that different strategies of advocacy and redress are called for. A critical social studies has the task of convening the conditions within/without the school setting where a discursive, dialogical communicative practice can unearth the structural and historical factors of community-level and macro-level problems. The students' status as an interested community of learning with many particular contexts involves a re-analysis of the way they have become particular personalities with specific biographies, and how they have become historical-ideological persons that unwittingly reproduce social and economic structures. Equally, it is a commitment in doing critical social studies to ensure a minimum of political immunity for students whose experiences in a constraint-free deliberation are surely rare. The experience of practically working toward understanding and consensus in discussion, deliberation and in direct practice can restore the sense of personal and collective potency in making and taking decisions that seriously affect each other's everyday lives. In this way social inquiry, given this broad view of a critical social studies, implicates a three-fold process of response and identification, interpretation and evaluation, decision-making, choice and practice at the level of personal reconstruction of cons-

sciousness and at the level of cultural and institutional reconstruction. The benchwork of reconstruction for any critical practical inquiry lies in the process of rational, discursive identity formation - in a setting where competing world views, interpretations, analyses and factual procedures are redeemed in a practical consensus. Embedded within this conception of citizenship practice, as within the tradition of critical social philosophy, (Markovic, 1974; Marcuse, 1964; Adorno, 1973) is a "global-moral thrust" (Johns, 1978) toward human responsibility and socio-political reconstruction. A work by Gerth and Mills (1953) reminds me that this kind of interdisciplinary inquiry portrays the dialectical interconnections between self-formation and consciousness, community, societal and global structures of relations and the contents of a critical form of social studies pedagogy. In my deliberations on social studies teaching so far, it may be instructive to remind cynical critics that I hold to a view of inquiry in which: "All meaningful knowledge is for the sake of action, and all meaningful action for the sake of friendship" (Macmurray, 1957); from his book The Self as Agent and Persons in Relation.

One intention that underlies the activity of specifying some of the structural and situational properties of a critical social studies is the implication that this view of pedagogy has for curriculum development and evaluation. I want to suggest that by adopting critical social practice as a mode of doing social studies means that we demonstrate an

essential unity between the moments of curriculum planning, teaching and curriculum evaluation. By basing this social studies practice on a tradition of critical social philosophy, we are able to overcome an historical hiatus between educational theory and method and that of social-political theory. Additionally, we can begin to point up the essential reproductive interconnections between school and society. In other words, by developing a practice of critical social studies we can see as developers, teachers and students, the links between cultural reproduction and social reproduction in, say, the Canadian state. A critical social studies implies a particular form of curriculum studies. That is, the effort expended on generating concrete radical practices in the classroom also necessitates for its success a theoretic perspective on the wider social relationships linking schools in the dominant social order.

There are other parallels to the theory-practice fusion that a critical human science reveals for education. Formerly undiscerned unities could be discovered between curriculum theory and teaching-learning methods, between the formal representational context of curricula and the form of their pedagogical embodiment, between a theory of history and ideology held by educational practitioners and the social relations of the classroom that can ground interpretation and strategic action, and between the utopian visions of the critical project and the means of its successful realization. These kinds of activities would be undertaken by curriculum workers, by teachers and by students depending

upon the phase of the social inquiry. Curriculum work and teaching would draw much closer together as would the role of students in validating content and developing practical, political learning strategies to overcome the contradictions of their wider social and cultural world. At first glance, I would see a critical social studies at a curricular level intent on challenging orthodox notions of educational culture and the social, political hierarchies linked to schools and culture. At a pedagogical level I would see an illumination of the contradictions of hidden and formal curricula as situated in the moral relations of the classroom. At the same time the auspices of a critical social studies can provide the practical pedagogical strategies for teachers and students to overcome such contradictions.

In sum, the principles of a critical social studies ramify within a number of moments of educational inquiry. I have argued there are hidden unities we can discover between curriculum development and curriculum evaluation, between curriculum theorizing and pedagogical method, between curricular representation or content and social action, and between the realm of theoretic discourse and that of practical action. In short, the principles of critical social studies point up a conception of a reborn educator simultaneously occupied with the nature and possibilities of human existence, and the historical and epistemic grounds of curricular knowledge. This teacher-developer is the embodiment of a value-laden method of inquiry which seeks through

social study a radical and critical transcendence of limitations in curricular theory and social reality. Contained within a method of dialogical teaching and counter-representational resources is a theory of value which warrants human self-realization as an ultimate criteria for a critical social studies. Doing critical study involves at least three moments of theoretic practice for curriculum people: There is an obligation to generate images of everyday life, to engage in curriculum theorizing, and for self-reflection upon teacher-developers' personal horizons. Concurrently, the inquiring person addresses issues of evaluation and worthfulness in the program in action. Since critical studies claims its knowledge claims to the satisfaction of human purposes and freedom (Marleto, 1974) and since theory complicity does not include an explanation of how theories translate into practice, the truth and validity of particular representations and theories that are articulated is partially determined by how well the theory is translatable in action. That is, the assumed intent as evidenced in the policy and practice of the theory is not realized, even partially, through the personal and collective action strategies and decisions that are made in critical inquiry.

In some of this kind of inquiry, there is centrally preoccupied with the problem of evaluation. There is strong consideration between this activity and the form of democratic evaluation allowed for by James MacDonald (1970) and William Apple (1974) in which the latter is the more recent work. He insists that the critical study

I have argued at length for the merits of a critical social studies practice. In earlier sections I have provided the reader with an historical and conceptual analysis of the reconstructionist strand in social studies education with a view to assessing the political and pedagogical potency of its utopian directions. In doing those tasks I tried to demonstrate the practical, methodological and ideological difficulties associated in the social studies practice advocated by modern day exponents of reconstructionism. I have identified the so-called Harvard School of public issues and jurisprudential teaching as a carrier of that tradition of dissent. Clearly, the logic of my analysis suggests that we should look toward more politically and socially radical alternatives in educational theory and practice as antidotes to the kind of underdeveloped criticism and study of society that would emerge from the use of existing formal programs. In the quest to reproduce alternative social studies curricula essentially preclude the development of a critical theory of critical social studies. The development of the curriculum and the development of a critical, historically and culturally aware education in all universities, schools or institutes. My belief is that a critical social studies would involve all levels of education in the critical analysis and criticism of social and political conditions. It would identify the social and political conditions that are the result of the current situation at all levels of this nation's functioning. It would be a social and political organization that would be able to identify the conditions of the political and

structural conditions emerge, that will allow us to act and inquire upon the historical sense of "truth".

What then is the general philosophic context in which this form of social and meta-social inquiry is grounded? What are the definitive practical and conceptual features necessary in order to realize critical social studies pedagogy? Methodologically, critical social inquiry itself, works with an implicit acceptance of the interpretive categories of social science. In order that one has the possibility of a social studies curriculum and to be in a position to theorize upon the world teachers and developers must understand the intentions and desires of the observed social actors. They must be attuned to the rules and constitutive meaning of their classroom, curricula or project orders. Due to the fact that the critical position is rooted in the felt needs of people, whether they be students or citizens first, it is essential for the theorist to come to understand the actors from their own point of view. Another feature of critical social inquiry has to do with the strategic or social action of members in a school, community or institutional setting. As radical educators involved not only in curriculum theorizing, but also in building formal program content, we are guided by Markovic's sentiment that "the standpoint of all philosophical criticism is man's self-realization in history and the transformation of an alien, reified world into a humane one" (Markovic, 1974, p. 16).

This point of view is historically particular to a tradi-

tion of critical social inquiry which allows its practitioners to sustain a concrete sense of their personal and political felt needs that form as curricular and research projects and to maintain a distinct, transcendent moral direction to their work in times of ideological confusion and stress. I have been reminding the reader of the analogue between the functions of theorizing and research as inquiry and that of curriculum planning and teaching as inquiry. This dual relationship is anchored and prefigured in the tradition of critical social theory. As with our living tradition of commitment to social change, reform, and reflective analysis, we can see its embodiment (and practice) in everyday teaching efforts, in nonprofessional community development activities and in institutional-based strategies of research, criticism and change. Clearly, different kinds of persons would engage in these separable moments of critical social practice. Whether they are engaged as teachers or students, as lay workers, or as theorists in differing projects dealing with personally and collectively experienced felt needs; whether they are sustained by the need simply to know, to elaborate, to develop procedures or to transform consciousness and structures, each act and each person is historically implicated and reciprocally affects the work of the other in this tradition of critical social practice.

As workers, and particularly as social studies educators, we unite in a common sense of action when discovered by

structural contradictions in order to resolve them and in order to supersede critically the present state of our educational relations and language, our representations and texts, and our given social reality.

We are united in common perspective on the practice of school knowledge, as critical educators, not only because we are teachers and learners, theorists and developers concurrently but by the recognition that "each historical epoch, presents us (and embeds us within) a general structure of human nature crystallized as the whole past history of human praxis" (Markovic, 1974, p. 35). This for us, as educators, is the inescapable ontological condition.

Now that I have said all this about the need for renewal in social studies thinking, the question still may be asked; where do we go from here? What should the prospective teacher of social studies do when he encounters program materials from an ostensibly respectable strand of social democratic educational reform? If my argument has been that we must reject Harvard School materials as being hopelessly naive pedagogically and politically, then what alternatives or precedents are available to fill up the vacuum caused by the castration of the public issues tradition? Finally, if there are precedents to aid us in our social studies renewal, how do we organize our own practical and strategic enlightenment as teachers and theorists in curriculum studies? As a culminating section I will briefly deal with these points under four questions: How are we to see the utopian promise and potential of reconstructionism in general and the Harvard School in particular?

What efforts towards concrete alternatives have been made in the social education field? Given these fledgling alternatives where do we go from here if as radical educators we are committed to pursuing social justice through the schools? Finally, what do we need to know about ourselves and our society to mobilize practically for our remembrance and renewal?

WHAT SHOULD WE DO ABOUT HARVARD SCHOOL PUBLIC ISSUES PROGRAMS AND RECONSTRUCTION?

I have chosen to deal with this point by revisiting the themes developed in the seminal 1967 article, "Education and Community", of Donald Oliver and Fred Newmann. They wrote, it is clear, at the time with a full awareness of the reconstructionist legacy to which they were heirs. In many dimensions they attempted to incorporate the community as their cornerstone for carrying on the educational and social reformist zeal that tradition contains. I would like to reconsider their proposals for reform through social education in the light of the preceding norms I have laid down constitutive of a critical social studies.

Newmann and Oliver recognize that efforts towards radical reform can be pursued in two directions. They argue that educators and social planners can adopt a utopianism of means and ends often detached culturally and politically from dominant institutional life. Equally, rather than withdrawal 'reformers' can work toward radical change by immersion within the institution of the school and within the

community that situates it. The critical practical tradition would understand both utopian idealism and institutional engagement as inter-related moments in radical practice.

Newmann and Oliver comment on the general absence throughout reformist education of any fundamental attempts to reconstruct the total socio-political context. The work of Harold Rugg (1936), George Counts (1969), Theodore Brameld (1965) are exceptions.

Considering the reconstructionist strand spans virtually fifty years these efforts are indeed marginal to the tradition. Rugg was alone in developing teaching materials and texts that understood social inquiry as both a method of study and as means for social reconstruction. The school was considered a special agency that was to use the total community as a workshop. Thelen, the article notes, considered the school as only one possible educative context but that its curricula were to be planned and selected by broad-based citizens' councils. Thelen recognized that changes in institutional arrangements were requisite to any broader conception of education; its practice was definitely not to be a function of the 'community of experts'. Oliver and Newmann, to their credit, recognize the importance of the practical political arguments of men such as Rugg, Thelen and Brameld. Both of them stress that efforts at reform through fifty years of reconstructionism and progressivism have failed partially through ignorance of the

contexts in which education is pursued. Reform through social education whether concerned with the design of subject content, teaching-learning relations or school organization must have a sensitivity towards historical context.

Much of what is thematized in their article deals with an alternative educational model that specifies the setting up of different school-community contexts. The school context is distinguished by reformist educators (Newman, Oliver 1967) as planned systematic instruction. The laboratory-work context is one for learning in the midst of active participation in problems and task-oriented activities geared to the satisfaction of "broader humanistic and aesthetic goals". The community-seminar context involves a "reflective exploration of community issues and ultimate meanings in human existence." They envisage these seminars to be grounded in reflective and deliberative practices where community and public policy issues are debated upon and planned as courses of action. The use of emergent processes of planning arise from the basic concerns of particular communities. They rely upon Jencks' (1972) notion of a plurality of structures and programs within school and community that answer particular needs.

Newman and Oliver have touched upon a number of significant themes that resonate with the organizational and pedagogical features I feel are required for developing and implementing critical social studies. For instance, at an impressionistic level they make reference to the fact

that the content of programs is to focus on critical contemporary issues that have a structural relevance to other communities in history and in the future. Needless to say what denotes a critical issue is never laid out. Students are seen as learning how to make 'better decisions' in the here and now. They are not engaged in becoming distantly-prepared citizens of a far off future. Teacher and learner activity is to be embedded in an "environment of reflection directly related to community action". (Newmann and Oliver, 1967). They offer an alternative program model which conceptualizes and practices from those vantage points. There is the practice of outside-school activity in which organizational, stress and lifeworld problems are tackled so that immediate problems related to teacher and student learning are mediated. By laying a congenial groundplan for formal school activity in the larger community, a second dimension of educational study is enabled. Here more formal dimensions of study are developed within which the education system's relations with the economic political and governmental system are uncovered by students' inquiry. They argue eloquently but diffusely for the role community education and schooling can play in developing a world order. I am less than certain about the exact implications of that term.

Finally, from a third vantage point Newmann and Oliver by way of their tacit dialectic of inquiry identify the prime problematic, in their alternative model, as residing in the difficulty in 'locating individuals, groups,

and so on with the incentive to begin deliberation on the basic model's premises and ideas'. In other words, how can education be conceived as the interaction between reflection and action? I would argue that each of these three clusters of attributes do resonate with the idea of a critical practical social studies. Yet, for our purposes as teachers there is no functional identity with our enunciated model, or as importantly, with the requirements for classroom practice and curriculum deliberation.

I make three quick points as a final rejoinder to what to do about Harvard School reconstructionism. Newmann and Oliver talk about the importance of context in the planning and politics of programs yet they are essentially ahistorical in a deep structural sense. Neither individual biography nor the political history of institutional life seem important for them. At least on those grounds, they forfeit the promised understandings that accompany contextuality. Newmann and Oliver are particularly reticent when it comes to unpacking their global notions of virtue such as human dignity, freedom, community, plurality, reflection and world building. These are terms which are cornerstones for them but remain enfeebled as normative ideals which could mobilize curriculum planners because such a diverse community would not really know what it was talking about. Unless we can be concretely specific about such ideals they become no guide for practical moral reforms. In having both examined and taught with the succession of public issues materials that are embodiments of

this 1967 article, I conclude along with other critics (Nelson, 1977) that there are serious discontinuities between the theme of the paradigmatic article and the ensuing in situ programs developed and implemented for secondary schools. It is the reader's choice, finally, to accept or reject this analysis for his own theorizing and teaching practices.

CHAPTER 8

NORMS OF CRITICAL PRACTICAL INQUIRY IN THE SOCIAL STUDIES

WHAT PRECEDENTS ARE THERE IN THE FIELD OF SOCIAL EDUCATION THAT ARE MORE CONSONANT WITH THE PRINCIPLES OF A CRITICAL-PRACTICAL SOCIAL STUDIES?

Recent reviews of social studies developments in Britain and the United States (Gleeson and Whitty, 1976; Foshay and Burton, 1976) show that the history of social studies (Johns, 1978) teaching has been concerned at least rhetorically with the curricular theme of 'better' world building. This has been accompanied with the intention to assist students and teachers in a critical engagement with their environment implying by this the self-control of their destinies as school people and as citizens. Yet, it can be argued, are such political and world-building reforms possible from within the confines of a classroom dominated by a particular social studies perspective? Is it, as Gleeson and Whitty argue, that talk of the New Social Studies and of reform from within school or community walls is just one more "language game amongst another"? We know from involvement in curriculum planning that "inquiry can be either open or closed ended". The notion of a critical social studies according to my ideal type, should be grounded in the practical lifeworld of its students and teachers. It should be attuned not only to the pragmatic, fluxes of political influence and interest but also to the complexity

within and about social institutions and power processes which allow the question of "How did society get like that?" to be continually raised and acted upon.

Of the few programs in the North America and Britain that I am aware of which meet some of the necessary conditions for a critical-practical, life-transforming social inquiry, each addresses at least some of the following pedagogical or curricular features.

I would argue that each program takes the stance of displaying alternative perspectives upon the world of the obvious. This involves opening new insights for teachers and learners without particular prescriptive outcomes in curriculum. Such collaborative inquiry enhances the transcendence of the social "IS" wherein school sanctioned learning means environment re-shaping.

Each of these quasi-critical programs pays lip service or functionally embodies dialogue as an essential critical mediation. Starting simply from students' interests of commonsense understanding dialogue-mediated content extends teacher-learner experiences to the institution and the community or context bound historical settings.

The move away from learning the pre-defined concepts and methods of disciplines towards more context-related enquiries will only offer more potent education, if it gives pupils the power to look critically at what they already know and to transcend it...For this to happen the social relations of the learning situation....

(Leach and Whitty, 1976, p.24)

have to be renegotiated to creative, collaborative, dialogical learning situations. Goodson (1975) gives us a succinct picture of what collaborative-cooperative method can be like:

Cooperative learning, unlike the prevailing methods, allows the student to 'come to terms' with the school. He can come to understand by experience and through dialogue how teachers deal with 'knowledge'. The teacher's knowledge is not something massive and fixed; it can be challenged and reinterpreted in ways that reveal new meaning for both student and teacher. The cooperation is a spiral process. The student kicks the ideas around, comes back to the teacher with a new set of questions, the teacher applies his knowledge to the student's problem, thus restructuring it for himself. The student takes it apart again, and so on.

In secondary schools the student is seldom given the opportunity to come to terms in this way. Every time the bell rings, a new prepackaged and predigested segment appears. The assumption is that somehow the student understands the rationale for the learning pattern, or does not need to understand it; he already knows, or he can manage without knowing until P.D. stage why history, biology and French have been taught to him, independent of the world.

In the traditional school the tension between the knowledge, values and perceptions of teacher and taught often occasions deep conflict, or at least mutual incomprehension. In cooperative learning this tension, the disparity of views, is acknowledged, becomes an object of attention for both parties, and in fact provides much of the dynamic for the learning process--which in turn is now seen in its true light, as much more a matter of changing the way one represents the world to oneself than of simply receiving new information. Consequently, the teacher has to learn to accord the student's knowledge and perceptions the same status and validity as his own and to realize that, against all the odds, he is not a trained professional.

him; 'academic learning', far from being synonymous with education, may often be the least hopeful starting-point for establishing an educational situation in the classroom.

(Goodson, 1975, p. 78)

There have been some practical attempts to deal with the widespread sense of irrelevance and uncritical qualities, associated with social studies, in students' minds. Typically, these efforts in the U.K., U.S. and Canada have tried to break down the barriers between schools and the outside world. This has often taken the form of a community curriculum where formal knowledge and community issues are integrated as living contents. The Parkway Program in Philadelphia (in the late sixties), U.S.A. was a forerunner on this approach, as was the Metro Program in Chicago and the C.O.R.E. - Earthbound programs in Edmonton, Alberta. In these instances there is a concerted attempt on behalf of program organizers to reduce the professional monopoly and mystification of the teacher as a knowing expert. There is a reliance on the educative resources and potential of the community rather than the formal aspirations of academic classroom pedagogy. We are reminded though, through Ellish, that because of the tie to secondary school course credits some of the potential radical thrust of these programs is lost. Certainly, the outcomes of the Citizen Participation Curriculum Project in Wisconsin testify to this risk. It should be noted that simply the extension of schooling efforts outward toward the community is no guarantee that social inquiry will evade conformity to established structures. It is likely to transcend some of the limitations found within

romantic notions of community (Oliver, 1976) and for social studies which does contribute to social change, students 'must see a point' to embracing or doing it.

A program developed in Britain under the Schools Council incorporates the two curricular features I have argued are necessary for a critical social studies: subjectively meaningful to students and critically transcendent in its political, social and educational outcomes. The Social Education Project of 1974, developed and implemented in midlands schools, provides some contrast to programs with similar supportive rhetoric. Yet

There are many projects whose aim is to make the curriculum more relevant to the pupils' interests and to the rich yet fluid structure of knowledge in the present century. But much of this is indirect teaching. The Schools Council Social Education Project was conceived in the belief that preparation for life in the modern urban community warranted a more direct approach. What was wanted was an explicit attempt to teach people an awareness of their own surroundings, sensitivity to their own and to one another's problems, and an appreciation of how individuals can collaborate both to inform themselves and to better their own lot.

(Penny, et al., 1971, p. 21)

In this program students can expect an arrangement of vertical authority in teaching and learning relations. Naive or romantic permissiveness is not the norm as students are inducted into disciplined knowledge forms. This is to be expected that they individually and collectively are to be held to certain standards and the extent to

which the learning project at hand is illuminated. Validity of content selected and organized in classrooms rests on how it informs the practical conscious decisions of students to become involved in social and political action for change. In this sense curricular knowledge is radically disciplined and practical. The program-developers of the Social Education Project conceived that students can and arguably ought to be initiated "as agents of change in their community" (Gleeson and Whitty, 1976). I ask the reader to reminisce about Fred Newmann's ideas in his 1975 'Education for Citizen Action' theme. Here the idea of environmental competence with all its attendant practical activities was a virtual ontological requirement for humanization and, clearly, civic participation. I see surprisingly parallel assumptions between the citizen action themes of Newmann (1975, 1977) and the Social Education Project (1974), concerning the bases for a full social and political life,

...to counteract the sense of social ineffectiveness experienced within our society, and the isolation which characterizes the lives of so many of its members. Social improvement is seen not as the manipulation of regulations or the handing out of aid to those in need. Active social participation in communal affairs is held to be a necessary (perhaps even a sufficient) condition for a satisfactory social existence.

(emphasis mine)

(Rennie, 1974, p. 93)

From my own analysis and review of alternative social studies projects, the Social Education Project represents the most potentially radicalized, collaborative form of

critical practical inquiry grounded in the school-community nexus that I have come across. What is problematic, however, is the methodological unpacking of what critical inquiry means in some of these projects. It remains for us, in this brief review of concrete precedents that address the critical practical question, to see how the use of materials and typical teaching and learning strategies particularly bridge the social theory and social experience dialectic of the classroom-community continuum. I quote Armstrong (1975) who aptly crystallizes the tasks that pedagogy and resource content are faced with in meeting the conditions of relevance and critical dialogue, community focus and incentives of mobilization essential to an historical tradition of critical social studies.

Somehow or other we are seeking to extend a power of generalization and conceptualization without losing the strength of an understanding which is rooted in a sense of particularity.

(Armstrong, 1975, p. 99)

In this expression I can see the promise and power of this pedagogical tradition for social renewal yet only glimpse the unyielding and complex political and institutional difficulties that surround the implementation of a program of this sort. I will make brief reference to some materials that attempt to breach these practical difficulties of effective action.

The program material reviews I have encountered, (Cleson and Whitty, 1976), which are consonant with the

perspective of this study, emphasize the importance of two pedagogical assumptions when developing social studies curricula of this nature (Nelson, 1977; Goodson, 1975).

That is, the materials of a critical social studies must lead students to recognize the practical implications of their own perspectives and assumptions, and how these very stances limit and disclose life chances for each of them in the world. Content and strategy choices in this format can suggest alternative social and cultural possibilities while providing a base for students' coherent political expressions of the good life for themselves. Secondly, themes and issues that are carefully situated within a network of dialogue and horizontal relations of authority can direct students to an exploration of why the social world with its attendant life chances is structured the way it is for them personally and collectively. The same pedagogical process can lead students to question particular institutional resistances and how they might in turn use social action as a form of inquiry and redress.

Several texts and sets of materials reviewed by Gleeson and Whitty (1976) are suggestive of qualitatively different kinds of resources now available. Longmans Social Science Studies exposes and engages students in a plurality of sociological approaches to analysis of the social world. The significance here lies in the methodological shift designers and developers make in seeing students as capable of internalizing, working and manipulating perspectives rather

naively accepting the given dogmatics of sociological orthodoxy such as inert facts and propositions. Work by a group of London teachers, portrayed in Teaching London Kids, in the area of social studies resources indicates a basis for renewal in critical inquiry.

Appearing to Others is a resource unit, produced by this group and I quote from Gleeson and Whitty (1976):

This unit is aimed at increasing our understanding of the complexity of social rules that lie behind our appearance. It raises a number of issues concerning appearances:

What constitutes and who decides 'decent' appearance--how this relates to age, context, history and culture. The ways in which we ourselves sustain particular definitions of decency. Rules of appearance as related to institutions (e.g. schools), occupations, sex, group affiliations.

Interpretations made on the basis of appearance particularly by people in authority, e.g. police, teachers. Consequences of such judgments.

(Inman and Whitehead, 1976, p.104)

There are few precedents for materials in the social studies such as these ones. For the junior to middle high school levels few opportunities are provided students to critically question their own self-context and the political and social organization of the everyday world surrounding them. Furthermore an active, guided collaborative exploration of these issues will begin to yield the alternative possibilities behind 'appearance', the sources and historical limits of common sense distinctions and definitions of

people, and of different ways of acting in the world. That is, kinds of materials such as these along with accompanying pedagogy can begin to illuminate the organization of the social world as historically mediated by powerful interest groups in which teachers and learners each wittingly or otherwise participate. The realization earned through critical consciousness is that the seemingly natural givenness of the social world is not fixed but can be dialectically transformed in the common interests of citizens and the disenfranchised.

This review of curricular precedents toward a critical social studies would be incomplete without recognizing the importance of rethinking the classroom context and the social relations therein that reproduce and stabilize dominant meanings, consciousness and forms of knowledge about the world. The mediation between content and teaching and learning relations is given focus in the Ford Teaching Project, University of East Anglia (1975). The project's concerns parallel a number of themes, adumbrated in this study, that fall under the theory-practice rubric as it applies to curricular research and teaching methodology. The project, similarly, was interested in how research workers and teachers could collaborate in "action research" as a means of moving teaching-learning situations to greater congruence with integrated-inquiry methods. I have argued earlier, following Bernstein (1971), on the importance of congruence between the style of pedagogy, the organization of content,

and modes of evaluation. For instance, multiple choice-testing as an evaluative device can vitiate the formal intents of, say, interdisciplinary content and collaborative pedagogy. The idea and practice of interdisciplinary work in secondary school social studies has seen the light of day more frequently in 'slow-learner' streams in Britain and in North America. In both settings school and university admissions policy set the stakes for what is considered high status knowledge and ability. There are, however, several important exceptions to this trend. The Citizen Participation Project in Wisconsin, the C.O.R.E. and Earthbound Programs in Alberta and Freire's cultural literacy approaches in Brazil and Chile are committed to the practice of interdisciplinary-integrated learning. Each takes as its starting themes community issues and concerns that impinge upon students' interests. Social science and humanities perspectives are not uncritically digested as authoritative content but used as points of view to clarify and 'round out' facets of research questions generated within the community of the school.

Recent work in Britain at a semi-official level provides some leads as to what the boundary properties of interdisciplinary-integrated social studies would be along a number of dimensions.

1. A student centred approach - involving student participation in planning, execution and assessment of work and a co-operative method of teaching.

2. The use of practical experience - in which direct involvement in social processes and contact with people who participate in the processes under study are treated as central, though not exclusive, features of social research.
3. A network approach to learning - indicating variety in points of departure and paths of study within a broad, though not inflexible framework....

The start of a new course would be a four to six week series of discussions and negotiations mostly as a group, but also with sub-groups and individuals. Initial decisions about what to start learning, how to learn it, how to organize it, would result The teacher's task here is a highly skilled and delicate one - to provide information and ideas to effectively guide decision-making without closing off options open to students....

(quoted in Gleeson and Whitty, 1976, p. 109)

I have outlined in this section, in answer to the question "Are there any precedents (for a critical social studies) to go on?" a number of instances of programs, research and resources developments in Canada, United States and Britain that resonate with, varying degrees, the necessary features of engaging students in critical social inquiry. Although I have spent some time on answering this question and mapping some concrete forms the ideal typical program could take, we may be left as teachers, or theorists or developers in a practical, organizational cul. de sac. I believe it is opportune after such a protracted argument has been made for reviving reconstructionism as an educational movement, and denoting its possible programmatic forms,

to take a moment to recollect where we have come from historically and conceptually in the curriculum field at the same time as querying our professional sense of direction in social inquiry. That is,

WHERE DO WE GO FROM HERE?

This plea is both a utopian and a political question and I shall handle the utopian moment first. The tradition of critical social theory that has informed much of my work in this study holds a definite vision of human liberation and emancipation that is essentially grounded in the nature of the human species (Habermas, 1968). I have referred to its concretely educational form in an earlier section. The tradition and educators allied with it see curriculum theory and practice as a distinctly social and political activity within which is incorporated ideals of human learning, knowledge generation and a sense of the good life that all individuals under realizable political conditions can achieve. Clearly, this normative ideal, in which emancipatory conditions for learning and development are continually re-achieved, is an intention that can be constrained, thwarted or limited by conflicting interests, points of view or institutional constraint. By the same token the activity of curriculum theorizing can be an educational practice that is supportive of conventional social and educational reality. It can obscure or it can illuminate the kinds of social and

productive relations which ground and support a particular way of organizing schools, of teaching and learning, and of developing content. Curriculum theories can be said to be implicit theories of knowledge at the same time as they are theories of the social world or society. Embedded within curriculum theories are tacit notions of what is worthwhile inducting or initiating children within, but in turn pointing to what is valuable and sought after in the society-at-large. Michael Young (1975) is able to add clarity to the long journey I have taken through the social studies mine-field by characterizing our curricular orientations as either that of 'curriculum-as-fact' or that of 'curriculum-as-practice'. For my purposes I shall accept Young's conception of curriculum theory as being to develop "theory or theories that may enable those of us involved in education to be aware of ways of transforming educational practice" (Young, 1975). There are a number of implications for our work if we adopt this as criterial of curriculum theory. It certainly resonates with the idea of bringing teachers and theorists together in constraint-free dialogue and research where the prospect of reflective, deliberative action on problems of teaching, curriculum, and school-community relations is more realistic. This criterion would reject as inadequate or mystifying the two views of 'curriculum-as-fact' and 'as-practice'. It would reject them on the grounds that in holding to either conception, we obscure the living social and productive relations which produce and sustain our know-

ledge and content relations. This would allow students and teachers to see curricula as the deliberate, historical decisions of living and acting persons. Curriculum-as-fact represents the orthodox view of knowledge as contained in eternal, ahistorical forms independent of cultural or social bases. Programs developed under this view transmit content, typically, as though it were fixed, self-evidently authoritative and beyond learners' intervention. Curriculum-as-practice reflects recent developments in curriculum theory by re-asserting the active intentional, subjective role a person's consciousness has in constituting knowledge. It views the content and meanings of program or school knowledge as situationally and culturally bound by the interests and intentions of individuals. It represents as a curriculum approach a counter-epistemological and ideological argument to the approach characterized as curriculum-as-fact. Where the latter understands knowledge as constituted by timeless, accretive, ahistorical forms, curriculum-as practice undertakes knowledge as dynamic, relative, historically shifting and interest-laden. Students involved in the latter type of programs, typically assume an active, contributive role with their peers in pursuing integrative, open-ended themes. In this context Young (1977) has argued, as I have in earlier sections with reference to the importance of reformist social studies, that if developers or teachers interested in change are to see real effects from their social inquiry practices they must be attentive to the dominant reality faced by

teachers and learners in the here and now of an industrial culture. They must take strategic measures in their critical practical projects to offset the interiorization of a technocratic consciousness within those teachers and learners they work with. Yet, it is this very form of consciousness in school and social reality that many persons hold as a world view - a form that is tenacious and ever so plausibly neutral to many people. Curriculum theorists and planners must take note of the existential here-and-now of people's views at the same time as holding onto that normative vision of emancipation mediated as it is by the critical practical project, elaborated through the course of this study. As important an issue for the achievement of curriculum practice is that theory must not fall prey to a spurious voluntarism which sees change as an outcome merely of persons' intentionalities unfettered and unmediated by conflicting interest groups, institutional inertia, social and economic class considerations. That is, curriculum theory and its practitioners must be attentive to the countervailing forces on persons' actions of political-economic structure and ideological argumentation. Schooling outcomes should always be seen as dialectical struggles between opposing, contradictory forces at the levels of consciousness, teaching and learning relations, knowledge organization and the sedimented history of political economic institutions.

The argument I have been making for renewal in social studies education has its analogue in curriculum theory.

If we accept that its primary and criterial function is to "develop theory... that may enable those of us involved in education to be aware of ways of transforming educational practice" then clearly the two areas of research, social studies and curriculum theory, coalesce in normative and strategic terms. My recollection of traditions of curriculum thought has given the reader some altitude with which to view the career of the journey of a renewed curriculum studies in its practical and conceptual aspects. I will rely on some of Michael Young's prescriptions then to give a final answer to the question: of 'where do we go from here?'

1. I make the association between social studies research and curriculum thinking a strong one. As a result curriculum theory must be pre-occupied with teachers' and learners' everyday meanings and theorizing. It must seek to explicate the relations between those meanings, organized knowledge and the larger socio-historical whole. We must renounce an atheoretical stance in curriculum practice and instead work with a notion of theory that sees the best of its truthfulness validated in practical action by the work of teachers and learners.
2. Curriculum thought and interested school practice must act strategically to build extra-educational alliances with many interest and community groups in the effort to realize its normative ideals for children, for citizens and for the future.

viewpoints intrinsic to curriculum work show us that school innovation is linked to the ongoing activities of persons, the organization, and the wider ideological climate of reform. In proposing social studies reform we engage in social studies assessments but not in a vacuum, lest we describe the phenomenal presence of a non-event.

Curriculum theory and social studies education is required to incorporate analyses of political and economic dimensions that can limit or enhance our understanding and control of reform movements. There is a need for an historical imagination amongst practitioners committed to change. Understanding the emergence of the scientific curriculum-making movement in the early twentieth century, or the development of the structures of the disciplines movement in social science, or compensatory education programs in the late 1950's, as the outcome of conflicting ideological and economic interests under liberal and monopoly capitalist class structures is of immeasurable importance in proceeding contextually with progressive efforts of democratic transformation in our post industrial culture.

CHAPTER 9

HOW DO WE GET STARTED PRACTICALLY: CASE STUDIES AND SCHOOL SITUATIONS IN CANADA?

I will treat the second and political moment of my earlier question about 'directions to take in social studies renewal' in a separate section and as a separate question. My response is distinctly pragmatic and deals with the problem of personal inertia, fear, and mobilization in the day-to-day reality of an administered life. Partially, for these reasons, it is terse and programmatic.

HOW DO WE GET STARTED PRACTICALLY?

I have been pre-occupied throughout the course of this study with the importance of certain kinds of theory for informing our work as teachers and developers on a number of fronts. I have suggested that critical theory can address issues of concrete research procedures, that it can re-orient our conceptions of what it means to do social studies inquiry, and finally how such a tradition of critical philosophy can deal with the problem of practical mobilization and resistance for change at a personal and institutional level. This is not to say, concerning the last point, that the function of critical philosophy, say in its role of ideology critique, allows us to act freely as in the way of a driving impulse. Instead, the critical tradition functions to disclose the social influences and assumptions, the con-

ceptions and forms of knowledge that act to constrain and limit our life choices so causing us to engage unreflectively in self-destructive practices and relations.

It could be said that the relation between our curriculum and social theorizing and our practical work in programs and classrooms has historically been tenuous. At worst we have been unclear as practitioners about how theoretical knowledge in these areas may be relevant to our lives. The more spuriously pragmatic amongst us have discarded theoretic practice in favour of trial and error, intuitive work in curriculum and social studies. At best, the theory-practice relationship, when it has been partially clarified, has taken on an instrumentalist or engineering conception of how knowledge can guide our actions. In a post-industrial culture such as our own we have become foreclosed to the alternative ways in which knowledge may be relevant to our lives. In curriculum research and in teaching-learning practices in schools we are accustomed to developing the kind of theoretic and normative knowledge that sustain relations of domination. Let us consider whether our theorizing concerning knowledge, the person and the social collectivity can indeed inform our actions without forcing a manipulative role on those charged with holding this theory. This notion is a vital one to consider when dealing with the question of personal and collective change that is freely and autonomously chosen. We must by the same token discard the fallacy that theoretic knowledge forms are inert, abstract and suitable only for

esoteric gamemanship amongst academics. The relations of power and disclosure are rooted in forms of knowledge and the capacity to act intentionally in and through a person's emotional, physical and social environment. I am arguing that we are never freed nor can we be of relations and traditions of knowing and theorizing. That to begin to admit and disclose how our actions and those of dominant others structure and sustain our self and worldly awareness, our capacity to act morally and to reconstruct our social situations is to begin the struggle toward our enlightened and emancipated life. It is in other words to ask the question, What other ways can genuinely scientific knowledge be practical?

I am arguing for a life form which includes a social-theoretic practice that informs people's needs and sufferings. I am suggesting that by choosing enlightenment we are embarking on a movement that deals with how to change, with new self-understandings, with new and more fulfilling life-forms. I have been suggesting that because ideas have a partial but determinative influence upon us that a change in our self-conception and in the social-historical origins of ideas is a first step in the transformation of self and social structure. A particular strategic aspect of the critical project is to engage in criticism and reflection upon "basic action-guiding beliefs" so that with work on other fronts we may be in a position to freely change our behaviour. I am sketching an image of freedom here that con-

sists of being self-determining in the ability to decide, as the basis of critical self-awareness, the manner in which we wish to live. Curriculum and social studies practitioners can act catalytically with one another and with students to reveal how "their own (murky) false pictures of themselves and society are a contributory cause of their own unhappiness." (Fay, 1975). In this sense, social and curriculum theorizing grounded in a critical philosophy are at one and the same time theories of the social world and of knowledge organization respectively as they are plans of action concerned with how actors can act differently as active, self-determining subjects in a world saturated with administered consciousness.

Fay (1977) in an important essay on the theory-practice link characterizes the project and the problematic of resistance and change when he says:

What matters is not only the fact that people come to have a particular self-understanding, and that this new self-understanding provides the basis for altering social arrangements, but also the manner in which they come to adopt this new guiding idea. In fact, rational discourse must be the cause of the oppressed's change in basic self-conception.

(Fay, 1977, pp. 224-225)

It is not only the belief or truth or the theory or point of view that persons hold which is important for matters of change. It is also the manner in which persons come to hold this view, their feelings, reasons and beliefs for doing so and why they can and will reject another

point of view. As important then for self-conception change is the (uncoerced) manner and milieu in which discourse occurs and alternatives are offered. Fay (1977) accuses many revolutionary movements, that insist on immediate, mass assent to ideological propositions, of neglecting the difference between the truth of statements and their rationality (i.e. the rational means of their acceptance). The problem for us here, as curriculum practitioners is that we would be faced with long term re-education and incentive programs in order to have researchers, teachers, and students acquire competence in logical argumentation. Clearly, our schools have de-skilled this kind of critical deliberative thinking to a narrow psychologistic focus. If, as Fay argues, rational assent and receptivity to the worth of argument is a pre-condition for radicalization, then our task for practical reconstruction is made more complex and elusive.

What would be some of the recurrent, necessary features for pedagogical settings in which persons are committed to critical reflection and reconstruction?

- A. In an institutional setting the observer can expect to see persuasion, argumentation, debate, criticism, analysis all undertaken as dialogic forms of communication.
- B. The presence of small groups that are egalitarian, relatively recrimination free with a relative commitment to a rational discussion of member situations and experiences.

C. Group life would be insistent on member responsibility for choices and decisions in a climate of openness, trust, and support for feeling revelation. (I am reminded here of the intense need to begin re-ordering school life professionally and administratively on a collegial basis).

D. That work within institutional settings and in groups marginal to the social collectivity comprise, in part, social and global analysis (of quantitative and qualitative nature on the intrusive effects on psychology and structure of the experience of everyday life); the development of a radical new vocabulary (within specialisms and in ordinary language); the growth and spread of consciousness-raising groups.

I am suggesting that the critical practical project for curriculum theorizing, as for social studies education, reflects

...a fundamentally different conceptualization of the world, in which one can see the particular and the concrete ways one unwittingly collaborates in producing one's own misery and in which one can gain the emotional strength to (accept/act) on one's new insights:

(Fay, 1977, p. 232)

In this culminating section of the essay, I believe I have provided a few necessary leads that many of us can employ directly in our work towards restructuring social theory and political activity. Let us remember that the inquiry has only begun, that we cannot be satisfied with

glib formulaic answers about curriculum change in schools, and that the process of enlightenment is historically infinite. I close with a reminder to all of us formally or tacitly committed to reform and to all its attendant risks:

"(that) in a process of enlightenment there can only be participants" (Habermas, 1974).

CASE STUDIES AND SCHOOL SITUATIONS IN CANADA

I have discussed in earlier chapters of this section concrete instances of school-based, community-based, and independently-organized social studies curriculum projects and precedents that reflect what I have established are norms of critical practical inquiry. These projects which range across North America and Britain represent alternative political, cultural initiatives in social education. There is by no means consensus on what constitutes critical practical pedagogy in these projects nor is there agreement on what successful learning outcomes are or how we could consistently recognize them. Furthermore the issue of the organization of curriculum development as a process of enlightenment is far from shared, and is at best tacit, amongst the participants in these projects such as parents, students, teachers and other citizens of the communities in which they are based. Whether 'blessed' or 'damned' I can discern from a higher altitude or meta-level some real patterns of convergence in this array of international projects that I have summarized in Chapters 7 and 8. Each

project is committed in some way to social structural reconstruction of the immediate and distant world surrounding students, in the critical present, and as future citizens.

The projects are organized at different levels such that student consciousness, community and societal problems, and the methods of critical practical reasoning and action

combine in living projects that include many participants.

Each project has curricular and social horizons that extend beyond organizing for the next social issue, or the next social scientific analysis of societal institutions since each project couples analysis, the contents of consciousness

and intentionality with the commitment to personal and collective transformation; that is, to some idea of the good

life. These projects in social education do not recreate yet another social science-for-pedagogy revelation that

happened so frequently with curriculum development in the

1960's and 1970's. Critical practical social education calls

the bluff of earlier 'citizenship approaches' by inquiring reflexively, politically, and historically into the nature

of the skills, competencies and consciousness that will

mobilize for citizens who will create participatory democracy

(in contrast to the stall of anticipatory democracy). In my

brief review of paradigmatic projects, I do not claim to have

been exhaustive in the curriculum developments occurring in

the United States or Canada; to do so would be naive for

these works are continually being virtualized and dissolved

in communities across the continent. What I can accomplish,

however, in this portrayal are the structural, biographical, and intellectual-cultural preconditions for doing critical practical curriculum development in social education. This partly involves identifying, knowing, and resisting the relations of domination and hegemony that fetter human development under organized capitalism. It also involves coming to know in some perspectives the persons who have been engaged in these projects or who will meet together in common interest in deliberation of their and their students' futures.

One of the conditions for empowering practical method in our curriculum deliberations and pedagogy is to step back into the lifeworlds of those participants in social education. To do so means to dwell in and seek to understand at a deeper level their arcs of intentionality as teachers and students struggling with new cultural forms, and the risks of personal and professional transformation. In many ways, to return to the lifeworld of participants provides this kind of study with a social text that can act as the auspices for understanding curriculum reform more fully. To explain why persons act or do not act upon their moral convictions is not a social puzzle that conventional human science is able to open for us. Stepping away, however, from institutionally bound speech and listening to the text of communicative action of participants reveals the kinds of cognitive grasp, moral development, and interactional or motivational competence that teachers and

learners hold of curriculum and pedagogical reform practices in their situational and structural contexts. To reveal the contents of participants' lifeworld concerns, in the organization of critical practical pedagogy, is an internal moment for this inquiry. To do any less in my practical method means to risk that this work becomes a methodological opportunism or a strategic 'vanguardism' in the names of this inquiry and of the persons working in critical social education. So, I have consented to 'let the people back' into my inquiry into curriculum reform with the hope of securing their living intentions of fear, anxiety, and desire in common projects of our renewal.

In this chapter I draw from a series of unstructured interviews with twelve experienced teachers and student teachers from across the province of Alberta. These interviews were conducted over a four month period in the spring of 1981. In some cases I returned to these participants two and three times to extend the depth of our discussion into the nature of teaching critical social studies. In each case the participants either through their own teaching experiences or through course projects as students were committed to practising or learning more about critical social education. Without exception the persons interviewed had had experience of some kind in the public schools of Alberta. Each person either had or was planning a first career in school teaching or community development work. The persons interviewed represent a select sample.

arbitrarily chosen, of those confronting the personal and pedagogical possibilities of implementing in some form the norms of critical social education as I have characterized throughout Part III of this study. This sample is not representative of anything more than a cross-section of exceptional teachers doing pedagogy that represents some existential and professional risk to themselves. Each of the interview participants through 'uncovered' self-reports has expressed or demonstrated an interest in critical social education. Similar to the unevenness of conception and realization of social studies curriculum projects in North America and Britain, that I alluded to, the reader will likely find the kind of understandings displayed in these interviews to vary considerably between each person; in fact readers will note, too, an internal inconsistency in participants' self reports at times. The reader will not find the interview particularly conclusive of anything nor are they meant as evidence or as validation of any thesis sketched in this study. The extracts from the interviews are intended to illustrate the variability in students' and in teachers' consciousness of what critical social studies means pedagogically, organizationally, and ideologically. The interviews do illustrate, heuristically, the levels of consciousness that typical participants such as these have for understanding self, school and society. They are important, too, for curriculum practitioners, for bringing to awareness the need for all interested persons irrespective of social consciousness to organize curriculum work as a series of publics in

communicative action. My role in these interviews has been that of social studies teacher and education faculty instructor of social education methods courses.

I provide the text of the interviews with minimum interpretation - either theoretic or impressionistic. However, I have given some consideration to understanding and identifying levels of consciousness of the participants from a genético-developmental view. Habermas (1971, 1975, 1979), Piaget (1970), Riegel (1975), Mead (1934), Kohlberg (1971), Flavell (1963) converge to some degree in their perspectives on how ego or self organization and development occurs. Each of these theorists tie ego development to parallel sub-processes of communicative action, cognitive development, and interactional or motivational competence. Together, these processes in a biographical-social context pass through developmental crises, accommodations and social learning as the child and adolescent reach toward degrees of autonomy from internal and external nature.

The import of the former developmental accommodations for critical social education research is as follows. Habermas (1975), Keniston (Youth and Dissent, 1971) Hampden-Turner (Radical Man, 1971) have done considerable work on the social psychological and culturological factors that affect the resolution of adolescent crises in youth; rebellion or apathy appear as the most palpable outcomes. Habermas argues (1979) that socialization patterns, adolescent developments and

crises resolution, and identity construction are strong predictors of "deep seated, politically relevant attitudes" (Habermas, 1979, p. 70). The embodiment of these processes is primarily in ego development - a dimension of which is moral development and hence the possession of certain kinds of moral consciousness. Ego, a key concept for psychoanalysis and hence for critical social theory, contains a basic normative connotation as an ideal personality state. Ego, as a concept, is both descriptive and normative and can be understood as the symbolic-practical organization of consciousness developmentally - spaced over time. It clearly has universal implications in terms of the species formation but it also contains empirical-normative referents for the individual person involved and for the social relations in which this intentionality is embedded. Ego developmental maturation says Habermas is not primarily nature like or invariant but is socio-politically mediated as is communicative development as a sub-process. The equivalent in psychoanalysis of 'ego autonomy' is an ideal typical personality whose formation and embodiment, socially speaking, is one of unconstrained communicative action. Definite social, political relations follow from this development. Social psychological studies undertaken by Fromm, Marcuse, Leventhal and others unmistakably tie psychological constructs together with sociological ones. This is because the communicative organization of ego development logically and ontologically requires a form of social interaction.

society' reciprocally presuppose one another. As Habermas painstakingly shows in Legitimation Crisis (1975) the organization and selection from cultural traditions in a society strongly determines the motivational, and hence interactional competencies persons develop under (organized capitalist) society. This being so we can expect legitimacy and popular action can be channelled through particular social forms of the institutional system. "...Total socialization (can) be recognized, if not in the fact that it neither produces nor tolerates upright individuals" (Habermas, 1979, p. 71). As Riegal (1975) indicates ego identity can be considered a dialectical concept that bridges personal interaction with social constraint. Cross-cultural analysis has yielded (Habermas, 1979; Kohlberg, 1971) the suggestion that consciousness can be identified as developmentally-structured. It follows that consciousness as embodied in ego identity is essentially social action and that consciousness expressed in communicative action can be testable normatively and practically. The outcomes for persons holding structurally dissimilar levels of moral consciousness, as a communicative-linguistic organization of identity, for critical practical inquiry should shift in terms of the level of ego identity expressed. (See footnote 1 for two schemata useful in the organization of impressions from the following interview dialogues.)

I have included extracts from four interviews due to time and space considerations and the fact that qualitatively

distinct forms of critical social studies theory and practice emerged for the interviewer in his review of the discussions.

Interviews with Bill

Bill is a young married undergraduate student in educational methods in his senior year. He is a native of the province having been raised just west of a large urban centre. He has voluntarily enrolled in an advanced social studies methods course. He intends to specialize in junior high school teaching in a suburban school district.

Excerpts from the two sessions:

Eric: ... What do you think would be the essential qualities (as) a teacher would have to have to succeed in elementary or high school (classes)?

Bill: O.K. with my student teaching there are three things I found essential. The person should have a genuine feeling toward the kids, they should like the kids or they shouldn't be in the classroom ...and they have to have variety in their lessons...not just one strict teaching style like lecturing or even role-playing every day the kids wouldn't be able. I think you have to have variety to be successful. If you don't pick up the same old notes every day I guess that's part of caring for the kids....

Eric: Does that mean a particular view of teaching you have when you say that?

Bill: I'd say that running through the notes - I wouldn't say that's good teaching...that's jamming things that they really don't. There's got to be something better than that unless they (teachers) argue that in ten years they've got the expertise that they don't have to prepare anymore; that they've got everything so perfect that they the kids are going to learn no matter how they put it forward. In my student teaching I tried everything from lecturing to role-playing, discussions, debates - anything I could try and it seemed to keep the kids on top of things ...and part of social studies is just keeping

them aware. You walk in the class and they have to... you know, they don't know what to expect.

Eric: What about specific things that the teacher might come out with?

Bill: Well, uh, something that I don't have which I think would be essential is the knowledge area - but you don't have to know everything about European history to teach European history which really surprised me ... I was scared ... I thought Jesus, I was teaching China to grade 8 and I thought I really had to start reading everything about China. As long as you know the concepts you want to get across then they're going to get those concepts.... And after your years of experience you do finally get the knowledge base which is broader. I don't think much of the content required here is really much use at all. Take the Riel rebellion; after you've taught you really know more than after learning about it.

Eric: I've talked with you all at some time or other what critical social studies might mean and also what it might mean to teach it and to be a student. Now if we were striving for that in the class (the practice angle) what is it like to be a student in the class with our attempts to put those into practice.

Bill: Uh, it's probably one of the most conceptual things I've gotten into in university... deepest study into a particular area... here you're really getting into it and I think I really achieved a lot by realizing that there was more to social studies than just the curriculum that's handed you from the school board. There's a lot behind it and a lot of different angles to take. There's not strictly what they say is what goes. There's approaches, and styles and different theories as to what social studies is....

Eric: What about actually being there? Say, either being challenged or set upon with questions and how do they deal with those as a teacher. Or, how as a student do you feel about those sorts of ideas we talked about? What does it do to your head?

Bill: It seems really abstract to me, a lot of it but I don't know if it was over my head or I didn't get interested enough or deep enough in it... but once you related it to the practical areas then I could see that there was a technical backing to it... but I don't know if the technical was necessary to understand the

practical...certainly not as deep as some of the discussions we'd had.

Eric: What about the role of the student?

Bill: Yeah, well I liked the atmosphere better in a small number of students there. That allowed to express your own opinions or your own feelings about whatever. I think though that I learned far more than I would have in a class of 40 people for three hours and to listen to someone tell you what the truth was and you wrote it down. I don't know if even the context mattered in this context. It's really rare that you sit down like that and force yourself to analyze something.

Eric: Any growth points?

Bill: I was just thinking ...a bit of self-awareness... it's made me more aware of what's going on. It's helped with the discussion skills and able to convey that to someone else... and to take a point of view and hold it up against everyone else and they try to tear it apart and you have to defend it. Now that's really good exercise because I'm sure we'll all run into that....There are just two instances of where I get something out of that class that I couldn't out of any other...I imagine you could do it with just about any subject matter...Everyone was constantly questioning other people and making them defend themselves which was really good... sometimes you had to tell the other person yes, I was very wrong.

Eric: What changes, if any, do you see in your actions as a teacher as a result of the course experiences?

Bill: I think I've got the basis for good arguing and that I could commit myself to something where I before I don't think I could commit myself to a particular ideology. And if you are committed to something then you can defend it. There might be things wrong with it... but that still gives you some sort of confidence that way....

Eric: Is part of what you're saying is that if you do hold an ideology you can defend? Is it important that you do hold one now? Does it make a difference?

Bill: Um, yeah I think it's important as a teacher because what it's given us is one step on the other people. It's going to take them a year of teaching before

they finally sit down and think and have some idea of where they're coming from whereas we're going through that now. We're going out there as teachers with a group of commitments and beliefs. They're fairly 'backable beliefs' and I feel it's an advantage over those persons who haven't.

Eric: Can you separate the teacher ideology role from that... just as a person?

Bill: To some extent you'd have to separate. I guess you'd have your basic values that your ideology - such as being honest or perform in a particular way in society. But beyond that most other people don't have any commitments except maybe to democracy. With this class you've gone into more abstract commitments - and taking on a commitment that you're not really that committed to but you develop a commitment towards it. I can see that helping you in any job. (Why?)... Well, yes it might jeopardize in looking for jobs since you have this commitment. But you'd feel more fulfilled as a person, if you had a job and felt committed to the goal of a job and you stayed within or close to that commitment. I think that would work within any situation, not just teaching.

Bill: ...I don't see critical as just disagreeing with people all the time; that's just too narrow. You can accept it in some circumstances and then there's a logical order in which you can be critical. You can't wildly be swearing and yelling. 'Oh, this is just a bunch of shit.' You've got to state your case. Well, I've seen that with different social studies staffs that some of them just say wildly, 'Oh, this is garbage' and they don't really analyze what they're saying is garbage. And they're right most of the time it is garbage but they don't know why - they haven't really thought about it enough just to say it's garbage. If you ask them why they say it, it just is - they haven't analysed it. But I wouldn't say all teachers are like that. They really do look at curricula, especially curricula, critically. They do have a particular commitment to a way of teaching, to ... a subject matter....

Bill seems to hold a conception of social studies

that bases its pedagogy on pluralist variety and care for students. Bill does not in any of this dialogue argue for a social studies that rises above these notions; social studies as public relations. Critical practical activity in this domain means, for him a set of reasoning skills to 'back up' one's arguments or pedagogical perspectives. Holding an ideology for Bill seems to imply taking a position, any position, on any issue. Ideology, for Bill is not synonymous with societal critique. Curriculum criticism can be more defensibly made, according to Bill, if teachers have critical reasoning skills. Yet analysis of curriculum and of pedagogy is grounded in whether these forms 'bore' the children or excite them. For Bill, the giving of reasons by teachers permits them to rationalize their conduct. This puts persons who can do this above most of their peers - in advantage. Bill does not bring out the wider questions of the justification of social rationalities. Bill exhibits a concern for doing his best at working within a pre-agreed system of norms in which the 'concrete morality of primary and secondary groups' must be saved; that would be his teaching peers and students respectively. Bill's sentiments expressed in these excerpts resemble an ego identity known as the good-boy orientation (and at times he indicates a law-and-order orientation). (See Kohlberg, 1971, Habermas, 1979 for a full explication of these ideas.)

Interviews with Rob

Rob is a young, single undergraduate student in his senior year in the education faculty. He is a native of the province having lived much of his life in a small city in the centre of the region. As a high school student he was involved in a school-community public issues program centred in his local high school. (The program was consciously structured after Newmann's 1977 citizen action principles.) Rob has travelled extensively outside of North America for personal interest. He intends to teach public school at some point in the future. He expresses an interest in global awareness issues and is essentially non-careerist in his educational training. He plans to return to Europe in the coming year to take up more studies in the French language.

Excerpts from two sessions:

Eric: In general, what would you say are the essential qualities any teacher should have to be successful? (Note, that I leave much undefined!)

Rob: O.K. There's about four that come to mind. You should be able to develop a sense of motivation with your students and the method you use to present material. You yourself as a teacher must show your own motivation. Secondly, a teacher must be diverse in his approach. There are many angles to a problem... a teacher brings a wide variety of knowledge to a group of students. You're trying to expand their depth. Thirdly, ... a teacher has to be one who can understand where students are at in their thinking, empathetic, and understand how they deal with situations. How would you communicate to them matters of relevance, otherwise? The final point is that

" whatever you teach has to develop relevancy (immediate feedback) to the students although its entire potential may not show all at once. ... To simply say we're going to study this problem, read this readings, and do a paper on how you would solve it. Well, unless the student can see how the problem is affecting him or how he can affect it, then it's not going to have any depth of meaning to them. Yes, and I think these can be applied to every subject - whether social studies or the arts. ... Motivation, diversity, empathy, and relevancy to your students.

Eric: You didn't interestingly mention skills, content or mastery?

Rob: I think the teacher is acting more as a guide. You can't just go in there and say anything. But I think you can provide a base upon which they can explore further in some depth. A lot of what happens depends on the personality involved. I don't think you can completely train someone to be a teacher. These skills may be brought out in the methodology courses in the university. However I don't think that type of skill in our training is really touched on.

Eric: I think that in our group our talk about critical teaching, critical pedagogy or social studies have implied changes in all of us... What do these changes mean personally for you and as a teacher... reflections and action are key ideas in the organization of courses like this? Autonomy means working within a tradition and yet fashioning projects out of your own personal initiative as a teacher.... What is it like to be a student in this class given those kinds of ideas at a gut level?

Rob: You mean in this class we're in? Well, it's quite different, it's quite small and the atmosphere feels different from a lot of other courses. I think we were exposed to a lot of different types of approaches. If anything it developed an awareness of alternatives; before I just didn't know what approach to take ... I can see their worth but how to practically implement them I don't know.... If anything, my own sense of direction in social studies is confirmed. I wasn't sure before. Everyone's ideas were accepted at an equal level rather than having someone saying,

'no', that's incorrect. A very typical thing happening in other classes is, 'you're analysis is not correct.' - Your ideas don't hold any weight ... sometimes I felt a lack of sense of direction in some of the materials we dealt with. A lot of things that happened were typical responses, a lot of them were things that didn't occur to me at the time and I quickly had to do some searching in order to develop a response to either support or say, for example how the 'activity' approach might be implemented... In the class when we did our little presentations on method I didn't feel better, for instance, for knowing more than someone else.... Certainly, in a regular classroom situation you can't just walk in there and say, 'Hey, we're going to be on an equal level and have an exchange of information. You have to develop that rapport with the people in your class.... There's a certain amount of risk-taking when a teacher puts himself at the same level as a student - it has to be carefully developed.

Eric: What do you feel about yourself as a future teacher in relation to this class? You may want to refer to the qualities and possibilities of relationships or just the ideas, or from my point of view the possibility of separating them out. So, what do you feel as a future teacher?

Rob: I know that as a result of these experiences my sense of direction and what I had always intended to had been confirmed through this (class). I was always a person who believed in a practical approach and after examining this program, understanding it, that I will take this approach; however, not in the first two weeks of my job am I going to revolutionize the system - it would be wonderful if you could do that... however the approach can be integrated with my student teaching technique.... I also received a certain sense of frustration with the present school system, what is happening and what could be... because there's a lot of valid programs around... styles unused.... Many places in the school system people are still teaching social studies out of the sixties... they still have their notes... you need an awareness amongst others in the field. For most social studies is history and geography and the lecture method; it's just so much more than that. There are subtle ways of manipulating people. Certainly, they're not going to convert their classroom

overnight - every few days I can slip it into the lessons. One day is better than no days at all. Quarter-time, yes quarter-time, we'll use it in our free quarter-time that is allotted by the Alberta government; for frills. I'd tend to say that the real stuff goes quarter-time, not three-quarter time.

Eric: Do you have a glimpse of your future teacher rôle under critical social studies? (challenged, threatened, what?)

Rob: O.K. I know that one thing that would develop is a sense of frustration because in wanting to implement it I could become narrow-minded and fail to appreciate others' point of view - you can't just ignore another's point of view even if your position is right. Frustration is a major battle one has to overcome.... (How much is frustration an inevitable part of critical teaching?) Frustration is something that could be avoided if a person were able to approach everything from many different directions - which is difficult. (an instance?)

O.K. If you wanted to effect change in government policy, perhaps a policy in relation to industrialization and you felt that industrialization was not a good thing. It was going to cause environmental damage, cause a change in your lifestyle. You would be approaching, in opposition, trying to convince other people, trying to make predictions and yet other people fail to see your point of view. (Frustration develops). Yet if you persist and consider how they could be affected it comes down to you making a value judgement because certain industrialization will do a lot of (contradictory) things.

Eric: Is there anything different that you see or feel or understand about yourself; or change in attitudes about your experiences in the term?

Rob: What did I discover! I certainly had to be more reflective about what was going on. I said before that this class confirmed my beliefs but that I had to, was forced to re-examine them by taking a step back at what else was going on, and I discovered I'm right!... That some types of curricula are not suitable for some people to do. My particular preference (activity approach) is right for me. That gives me a good feeling, a feeling of confidence to go out and try it.

Eric: Well, but what makes you feel right, Rob, what's it like? Did someone just say, you're right Rob?

Rob: Well, it just clicked like that, I'm right! (laughter) Well, I think basic support from other members of the class; you know they were always open (that didn't keep on saying I was right, though) and I had to consider other points of view. They said this to me... but other people are going to help you arrive at a better understanding of yourself and how you view the program you're dealing with. You know that was promoted within the class partly through the examinations, others' work.... Any one of these programs we have discussed have promoted more aspects in the total development of a student than the traditional classroom setting where information is disseminated.

Eric: Taking what you and I have considered 'the critical' what might it mean to teach a child this way? (or high school students).

Rob: Well, certainly the student would learn not to accept everything he reads, what he hears on the news, what other people (the teacher, especially if it's in print) say; one thing that would be developed is the ability of a student to question everything. From that he is going to have to decide what is right for him. Another quality that would be developed would be an acceptance of other people for what they are. Perhaps he doesn't agree with those persons, with their feelings or values but accepts them for (what they are). So many of the social problems that develop are as a result of people trying to change themselves because of peer pressure.... Sure there'll be crises, but maybe my lifestyle not really for me - am I who and what I really want to be?.....

Eric: O.K. Yes, if though you're going to question everything, then what will you go to; what's your basis? I'm not talking about a logical trick here. What is the basis of student's questioning?

Rob: In examining the question, no matter how much (is done) of both sides; I'm not saying there's two sides, there's many sides of a question but the major thing that's going to come into it are the major values he's already developed (right or wrong). They're certainly going to play an

important role in the action or direction he decides to take. (Does this mean providing the means for new values)

I think so, what you make or work at a change in your values it's going to affect the next problem you deal with.

Eric: O.K. What's involved in taking on a critical attitude to others, to students, to ideas, to what you do? (This overlaps with others I know.)

Rob: O.K. The acceptance, the exploration of many ideas. I think you have to formulate a stance; become committed to a point of view. You can't just sit there and be wishy-washy all the time... (But) in taking a stance means to be aware of both positive and negative aspects of each problem and to be aware of that is what you must develop in a student... It's harder to do something like that... it's easy to take a stance something if everyone seems to be doing it; yes, I believe in that, and not really know why and since everyone's doing it, well. And that's a very easy way out of doing it. If you're going to be critical about something then it's going to take a lot more work, a lot more investigation on your part. It's not going to be easy but I think you're going to be a better person for it.

Eric: Yes, but why do it (at all?)

Rob: Why not? Personal satisfaction.

Eric: But it's satisfying to feel warm and secure!

Rob: Yes, but it's distressing to know that you're ignorant toward the situation ... you have to have a certain degree of critical attitude before you can question it otherwise you're very happy in your own little space... unfortunately a lot of people are. I mean why do we have a political confrontation? It's a result of steadfast beliefs... (no, not trapped only in language). Attitudes and culture have a lot to do with it ... the old democracy - communism (situation) and they're both just high degrees of indoctrination. One is more blatant than the other but they both exist....

Eric: How do we avoid the bind you point to between declaring ourselves as teachers, not fudging

with a so-called neutral stance, and yet have students pick up and generate their own positions while the teacher dominates the action?

Rob: Well, I think the key is (this is a problem of the students not questioning what the teacher says) ...well, awareness. You know I think you should come right out in the open and say, "I do have a point of view here. I do hope you're not going to take everything I say." But so often the teacher makes that little qualifying statement at the first of the year and that's it... there's no other exploration done and you have to promote that....

Rob seems to distinguish, at root, between practising good pedagogy in social studies teaching and the demands his conscience makes upon his actions and talk with students and other citizens. He is willing to devote considerable time to classroom methods that respect the interests and motivational patterns of his students. He feels it is important to have students' own experience count as curricular content when they come to formulate their own positions and conduct. Rob feels the difficulties are considerable in trying to connect his view of the world through his teaching so that students can be exposed uncoercedly to alternatives. He rejects much of what passes for conventional curriculum and pedagogy and conscious that ingrained political beliefs and cultural patterns must be confronted. Instrumental manipulation for him is unacceptable. Critical practical pedagogy, for Rob, includes the expansion of teacher and student awareness, exploration of immediate social issues and alternative possibilities, and the formulation of socio-political stances by students and by teachers either in voluntary concert or as

individual choices. In critical teaching content, as a cornerstone of curriculum recedes in importance. Ignorance, awareness, skepticism and the right to know, and the freedom of choice are important procedural principles for Rob. Social studies is particularly suited for developing this consciousness in students. But other subject areas can do as well. Rob shows a pluralist conception of the cognitive world. He is thoroughly respectful of enduring democratic civil liberties yet he pays stock to the social-institutional whole of society - as a bedrock of lifeworld interests for all persons. Essentially, Rob seems not to operate with what can be called a sociological consciousness of the world but with more of a conception of self-evident natural law. This is the assumed arbiter of human rights, wrongs, decisions and welfare. Students must be inducted into this tradition non-dogmatically and discursively. Habermas (1979), Kohlberg (1971) consider this cluster of social psychological traits to be an orientation to social contractual egalism.

Interviews with Marc

Marc is a slightly older post-degree student in the education faculty who intends directly to enter public school teaching. Marc has worked in other occupations during and before his professional teaching program but primarily involving manual and outdoor labour. He has lived most of his life in northern Canada amongst native and other minority cultural groups. He identifies himself as Métis and strongly supports the

expression and political organization of native rights. He intends to return to teach in the far north of the province when the program ends. He is self-protective about his own identity when completely immersed in a dominant white culture.

Excerpts from the Interviews:

Eric: ... What was it like to be a student in the class concerning the kinds of ideas we tried to work with?

Marc: ... I really, really thoroughly enjoyed it. For one thing, it was the first class that I ever been in that was a seminar type class... and you had to talk and that's something where normally you don't. We sorted out ideas and looked at approaches. Whether we agreed with them or not is unimportant... we tossed ideas around, made objections about them... how would I describe? It was a creative way of dealing with the topics.

Eric: But as a student, what was it like?

Marc: I am thinking particularly of our discussions on values and morality in the classroom. I disagreed with some of the others and I really had to sort it out in my head exactly what I was trying to get across... and I'd never done that before. I used to approach it as a personal dogma; maybe that's the way I presented it sometimes. One of the most valuable things I got out of this experience, right at the very gut level, was to look at my values. Every teacher should have to do that... 'cause you're going to get into a classroom and kids are going to ask you these questions... basic questions. And if you've never really sorted them out you're just rattling off facts or dogma. I didn't come out of there 'gung-ho' about any particular approach but I really saw something of myself that I'd never seen before. I had to sort it out as best I could.

Eric: You saw something of what, could I press you on that?

Marc: My values, what my values are not just as a person but as a teacher ... but I think, as good as some of the courses are here, they should make teachers look at how they click, you know really try and face their values. You know you hear an explanation of something, you can see the point so you agree with it. To really try and formulate your own beliefs, really search them out, and discuss over them is (very important).

Eric: O.K. Then what did that process tell you about your beliefs, what did it make you feel?

Marc: I saw that many of my values weren't based on any thinking process, ... just based mainly on emotion quite often, too often and, uh, that was sort of hard to accept. You know, when you have to defend yourself in a class like that you have to sort these things out... and accept them or change (yourself) ... or (retreat). You must participate... you can't always retreat.

Eric: I can't resist asking you but how does the critical think come into what you're saying?

Marc: That's exactly what I went through. I had to critically look at myself and at my values. If I as a teacher can do that in the classroom... (make) students sort out their values and see what they're based on... that's... then I don't think you can ask much more from a social studies teacher.

Eric: Does that, wasn't that mean a commitment then to yourself, to dignity, to the kids and then the things on top of it in the way of subject matter, issues... which may be a good way of approaching it? (There was a lot of role reversal going on over the term in which all of us took on different ones... teacher, student, inquisitor, so on. How did it feel for you to do that in that setting?)

Marc: I couldn't say I was nervous... but because I knew what you and the classmates expected... say, in a presentation the objectives were clear and you knew how much everyone knew about it (except yourself) and you, in changing roles yourself... you were very good because you'd ask questions all the times. You weren't sitting back judging... not even directing... bringing out other information ... I was always worried about not having enough evidence for the presentations or viewpoint I was supporting... not going in depth enough....

When you're dealing with an approach, the environmental approach, for example, there's so much theory associated with it that I know. I was more practical.

Eric: When you said you felt you had't enough material what did you mean by that and how do you know?

Marc: Sometimes I'd feel reluctant to carry on an argument that I was trying to develop...but again, it was a very productive atmosphere. You knew that the other students weren't there judging you. They were there learning as much, and to contribute as much as you. I didn't feel ill at ease, in those circumstances but maybe not personally satisfied....But realistically there's a lot of material associated with these traditions and I'd never come into contact with it before ...and as far as presenting myself it was an excellent opportunity.

Eric: What kinds of personal meaning shifts if any did you get through these experiences?

Marc: Well, again I'd have to say looking at myself critically was one of the things that will really help me as a teacher, and having students help me, and what approach I don't know. I'll try different ones good for my personality and the environment I happen to be in...Prospective teachers should have to go through a course like that and really look at themselves. I know I changed, I really changed - the way I looked at myself, the way I hold onto values ... the mistake is often made of making values a slave to emotions ...and if I can somehow instill in students the danger of this I'll be happy with what I'm doing.

Eric: I'd like to press you a bit further on that - values and emotions!

Marc: I love to argue or discuss in a class and it's so easy to approach say, moral dilemmas and stuff just from a totally emotional basis. You can use words and facts so easily. But if you really want to search for the true meanings in values, the purpose of a value... it's something which deals with the human dignity almost... it's what you feel about yourself is reflected in your values. Gee, the social studies teacher, his job is so critical (that) the students he produces or come out of whatever he's producing... if they

come out with their emotions in control of their values then we know in the world around us there's so many cults springing up, where kids are lost, they're confused, they have nothing to base their values on except emotions and emotions change in.... But if you get students coming out of there who've really examined their values, how they've been formed, how other peoples' values have been formed (and the conditions behind them) then you're going to have people who are more tolerant of others, who are moveable to cope with the social problems we're running into nowadays (population increase, dangers of war). These people wouldn't panic as easily. They'd be more in control of themselves. Even in the family life if they relate to other people in terms of a productively critical outlook they'll be happier, their families will be happier, the society will be happier, we'll have a better world!

Eric: Some people though will be challenged in the world by that though?

Marc: Definitely!

Eric: What would you say are the essential qualities any teacher should have to be successful?

Marc: Well, from my experience I can see a teacher has to be very interested in the topic he or she is teaching and the students themselves. Like, if you... the students can feel the teacher is interested in what they're saying ... and wants to be there. Then they will carry that attitude themselves. In social studies, specifically (with the critical approach) ... to look at social problems from an objective standpoint, to get and analyze facts, develop a skill in forming a value judgement. You can't put down six or seven points and say these are the steps to making a value judgement. It's something a student must get a feel for... it's the student's own attitude. In investigating these (issues) he is discovering himself. The teacher is getting students to investigate social issues. But what are they (social issues)? They're based on fact, on value judgements, and the judgements (from these methods) are based on a logical approach, a critical approach. Things like humour, a variety of approaches to material they're a... (necessary).

Marc expresses a strong conscientious humanism about his relations with others (students included). He is concerned that substantive issues and good pedagogy (his conception) combine to promote dignity in others. He finds it inappropriate to lay down strict-exact technical competencies for social studies methodology or clarifying and identifying students' values. Values, for Marc, are sacrosanct expressions of students' (and others of course) identity and embodiment in the world. Marc implies that social growth is psychological growth and that in developing or 'de-repressing' reflexivity means that formative, decision-making energies are released in the person; almost like an axiological naturalism. The study of social problems while important is a means to an end; - that is, restoring to persons the basis of their autonomy and the humanization of educational, family, and social life.

Marc understands values to be beyond facts and emotions and yet incorporates the latter two dimensions as part of the core of human action - that we must recover. Critical social studies have a vital if singular role to play in this work of recovering or leading to awareness a reflexivity that empowers self and others. Happiness, moral harmony, autonomy in decisions and beliefs, and tolerance of diversity, and social problem analysis (as a complex of value-laden interests) are the pedagogical and citizenship functions of critical social studies. For Marc, being critical means to

lift the veil of prejudices from one's personal belief patterns, to open oneself to the well of personal energies, culturally conditioned, within oneself, and thus to act in self determining ways - a sort of personal revelation and emancipation from the redundant controls of personal dogma. Marc expresses a sense of the transcendent in matters of human interest. He does not show a societal-historical dimension, so far, in his social studies theory and practice. I am reminded through his talk of the ideas of Rousseau (on natural individual expression and the dimmer horizon of a social commonwealth). Kohlberg (1971) and Habermas (1979) might categorize these sentiments as a social contractual orientation.

Interviews with Mike

Mike is an older married student having returned to the university to pursue graduate work. He is an immigrant to Canada of fifteen years who went almost directly to the northern rural communities of the province to teach public secondary school. He has had considerable experience in the classroom with a range of students, of all social classes, to whom he taught social studies. He enjoys school teaching, is considered highly competent by his employing school district, and yet he also wants to pursue the life of the mind - his mind - at this university. He displays a definite social consciousness of the conditions surrounding curriculum development. He has worked extensively on community issues

projects with his students which he feels, at root, is the only defensible social studies teaching. Mike may return at the end of graduate work to the northern community he first taught in upon coming to Canada.

Excerpts from 'Several Interviews:

Eric: What is your conception of the essential features any teacher should have to be successful in the classroom?

Mike: Well, I think first of all the teacher has to care. He has to have some kind of respect and regard for students seeing them as human beings. As I've been teaching a long time the emphasis on anything like knowledge isn't anything like as important as the relationships that can develop in class between teachers and students. In fact, those sorts of artificial terms like teacher and student can virtually disappear. Lots of people think this happens in their classrooms but I suspect just because of the nature of schools, the nature of the day, so forth it's not as true as we think it is....Some teachers can relate to students in such a way that it's human beings working together on some issue or question. It's only when relations like that develop in classrooms that you can get to that critical perspective in any type of shape or form....You can't write points on a blackboard in order for students to become critical thinkers. It's not a formula - it's something you develop together. You have to be as open as the students....You have to be able to live with oneself, too, 'cause students will often develop critical thought in such a way that they will begin to criticize the institutions that they're in of which you're a part. At least the institution sees you a part. They separate you from the student. So you've got to be able to live with another form of criticism from your colleagues as well.

Eric: Are then questions of skills, knowledge and so on, very much in the background of critical pedagogy?

Mike: Very much so. I think that people look at the word fact, and in their minds it's always when did John Brown do this or what date did this happen.

When you start to look at the word fact critically, that type of meaning disappears. It means doing something together and then you begin to recognize where you come from; some of the underlying assumptions you've held; the fact that we're all victims of ideology; we begin to expose all those sorts of things. So it's very much a different type of educational experience for the student. It's more than just questioning. Lot's of people in the 'sixties thought they were teaching kids to be critical and it tended to be knocking things down.... The way people perceive things, in some ways, is no more their fault than the way you perceive things. It's that whole historical tradition of where we come from. It's only when you can get students to start looking at that sort of thing that can (introduce) someone into critical thought.... So much of traditional schooling does not view fact in that way at all. It worries me, for example, in the way that in the Alberta social studies program, the way generalizations are handled they're not seen in relational terms at all - except in a mathematical way - where we add one concept and add another concept and that equals a generalization. The relationships are never looked at....

Eric: Yes, I see it that way. Facts or generalizations are essentially practices that coalesce or break away; they are relationships that are achieved and never exist as facts or iota independently at any time!

Mike: That becomes very hard for people to recognize in a way. I think that ... whoever writes, whoever speaks, and so on... we're usually talking in terms of relationships. Until we can see that I think we're blind. Say, with political parties one might say that one is more advanced than the other. But until you can see these phenomena and their outcomes as relationships then we don't see anything.... Teachers are as much victims as the students of the system.

Eric: In terms of some of the things you've done; say, even adopting a critical mode in the classroom what do you think your students, or students in general would undergo as we practise those kinds of relations?

Mike: Well, I think that when I look back, ...Some of the students are very perturbed at first. Most of them

as high school students have, through experience, got the system beat in a way... or react in anticipation of how they think the system will behave. Therefore when you take away the boundaries or guidelines they're used to... they're a bit disoriented.... In some of the projects I've been involved with and I'm thinking of one 250 miles north of Edmonton where the students themselves were confronted they had to become far more involved in things ... they were the audience before... In this particular project the students had to go out into their own community ... (it was voluntary). They worked with people like their own parents and they discovered they had a great deal of expertise they never expected before. Because that's not the normal expert they perceive to be the expert... I guess with their parents they put on a different pair of glasses so to speak and looked at their community critically... all types of things taken for granted. The two of us when working with the students didn't know how things were going to go either. We were just as much out to sea ... a year later we got students involved in another project. But this time they decided they wanted to make a brief to a land commission concerned with whether a gas company in the area should put sulphur extractors on its plant or not. Then they called in so-called experts from the Department of Agriculture and we realized just how critical many of the kids had become. These guys didn't get the questions from the students that they expected. It took us almost a year to realize that what this exercise had developed in some students was what we could call critical thought.

Eric: How have they changed?

Mike: Well, in one sense I suppose they've become politicized certainly over the ecology, lifestyle, the environment. Some of the assumptions associated with these they began to question. They began to ask, for example, why when barley crop reduction is associated with gas plant emissions would any commission still allow these companies to go ahead. In a sense they're trying to put one and one together and make two; but it's different they're looking at the power relationships, the long term trends, and asking how is Amoco able to do this ... whether we'd totally call that critical thought is up to the observer.... These are concerns different from those usually you run into in the classroom... I was never sure that when these kids

got their answers back their interest was there because most of them were going to be farmers and their livelihood was threatened or that there was more to it than that....I'd like to think there was... say, detrimental in terms of land production and in the way the company was operating....

Eric: What about crises of identity or personal reactions from the students or the community?

Mike: Well, I know that some of them went through... some problems.... Feedback from parents, from others were concerned about the kinds of questions that students were asking....They feared me and John and thought maybe the students were being manipulated....But we tried to go through that co-active sort of system ... not influence the students unduly... and some of them felt that the students were becoming sort of radical. Now I've always found the word is used very strongly, particularly in North America. It can be used in a conservative or a left-wing way ... parents, neighbours felt they shouldn't get involved in things this way. But the kids felt they had to. This was what being human is all about... is getting involved in these situations. At least having some control over your destiny... in another project I worked on we went to an Indian reservation and the teachers there were going to tell them (the students) what it was like to be an Indian. They knew, they had been to university for four years. But you've got to confirm it with the natives. That's not the way most teachers operate.

Eric: What is it like to be a teacher, at the time and in retrospect, in that kind of a class?

Mike: Well, at the time I suppose as I was as confused as many of the kids. The stuff I did earlier in my teaching career was so much more comfortable. I was so much more comfortable. I was in charge of the rules. Now, trying to develop this perspective in the student means I surrender a great deal. One of the things students do in that is to expose you. We think we're very student oriented but in fact they're not... I think I took myself by the scruff of the neck and asked myself are you really doing this, are you really letting them ask questions or is it just simply a gloss... you've kidded yourself....In one sense I was fortunate that I taught in a school, and due to some things I had

done previously, I had a degree of legitimacy which a first year teacher wouldn't have.... Like the principal wasn't worrying about control... or where the hell were the kids.... In that sense some things were not unproblematic while others were. I think we were allowed a freedom, unquestioned almost; I don't think people knew what we were doing ... if they'd sat back and looked a little whether we'd be allowed to continue.... But by the fact that we did continue and got parents support (and activities were successful and Amoco did put extractors on..) that may have legitimized these things so maybe we'll go do it again. But I'm not so sure what kind of reception people get when they do try to get kids to think critically....

To be honest I don't think I ever thought of the class as a community of learners... only gradually did I see together how we could do things, together. You know there are communities and communities. In some cases teachers create communities in their classroom but they can leave them, always. Now, the type of thing we were doing, in the community I had to be with them. I was as committed as they were. If the thing collapsed I collapsed as well. I couldn't say to people, you know it's due to their inexperience that they make these types of errors. Sometimes I don't think their commitment (the students') was to me but was to the other kids and so it worked out just the same.

Eric: What do you see, if you were to continue on in your future teaching with these ideas and practices, what would be the possible limits or struggles facing teachers?

Mike: ... the things that really begin to worry you more than anything are the constraints placed on the teacher... if you read, on the one hand, curriculum guides, they often talk about how 'open-ended' they are, 'social action-oriented,' and 'committed' and so forth. They would appear to give you a tremendous amount of opportunity to do this... on page 1 this is a social action oriented program and you turn to page 2, and it's bloody prescriptive. So you know you've got to read and you know it's doomed. It's not really social action oriented at all.

So you've got a problem... if you decide to become social (action) oriented do you end up manipulating the students... or do you take the stance that curriculum on the whole tends to be

accepted by society..it represents what society wants ... or is it just a bunch of gatekeepers, status quo, which I think it is but nonetheless there is a bit-of-tug of war and responsibility to these students but this determined by someone else....What do you do... and here's some kid running the car off the road some forty-five miles off in the sticks. Well; we went ahead and did it..... I do know that when we went to write some of this stuff up (E-town School District) thought it was a great idea. They gave it to a first year teacher to do and of course when she couldn't do it that proved to them that the process does not work. So, you know which seems to me - they can say they tried it and it's not applicable.

Eric: Now, how does it (the school system) diffuse; in what way?

Mike! ...it does seem that the institution, this whole ball of wax we call education sometimes resembles a black hole. The powers that be sometimes think teachers are like that, too. They absorb all these things and it just "plumpuh"; nowhere! I think that the social action programs which are tentatively far more critical, those things on the whole are kept at a very safe level.... I think that if you've got kids cleaning up your yard then that's considered to be good. But when you've got a bunch of kids who're suddenly turning up all over Northern Alberta trying to get gas plants to put extractors on, and they're taking samples out of creeks and they're finding that Hudson's Bay is leaking ... gunk into the creek and Hudson's Bay gets fined \$250. and extra time to pay.....I think that's considered in a much, much different manner..

Mike's years of experience should not be allowed to stand in the way of the reader appreciating some of the social studies' theory and practice distinctions that he makes. Mike maintains that things are made easier and given more legitimacy the more years you have taught. But qualitatively certain kinds of understanding and consciousness must be present as you begin your pedagogy. That is success in

critical pedagogy is not purely a function of experience - although political circumstances play a large part.

We see Mike referring to the distinctions between his personal self and his teaching self and how these distinctions as do others in our teaching vocabulary break down in practice. Pedagogy for him, seems to be the establishment and nurturance of caring, respecting relations. Similar to the other teachers, Mike feels to establish this rapport and care for others, as students, is essential for mutual trust. Trust is important for the crises, risks, and exposure that teacher and student undergo in critical social studies project. Constructs, techniques, and sometimes content recede in strategic importance for him the more that pedagogical relations are deeply understood. Mike also makes the distinction implicitly, between consciousness, classroom, community, and society such that his awareness and those of his students are progressively generalized in time, space, and action to incorporate these social levels. The teachers' linguistic organizations in the classroom become a kind of discourse which is embodied in political conduct. Mike feels that he has been relatively successful in institutionalizing critical thought in his students. The community action projects that grew from classroom deliberation and analysis, as blueprints, reached others in the external world who reacted sometimes vigorously to these students seeking an identity through their 'autonomising' activity.

Mike first makes and then seems to reconcile the distinction between theory and practice in social studies teaching. Facts and theories he argues are primarily to be understood as intentioned social relations which express vested interests and culture-bound perspectives. They contain a richness, as objects, of intentionality and possibility but that is the origin of their mystique - not facts as 'imperial' facts. By seeing fact and theory as relations rather than as objects and by coupling this with unconstrained, communicative pedagogy the practical outcomes of classroom discourse, or discussion become organized, politicized conduct outside and inside the school. Social studies theory and practice, according to Mike, are reciprocally informing provided the social conditions sponsoring pedagogy are present and that some kind of depth consciousness and movement is present in classroom decisions.

Mike in his social studies curriculum projects distinguishes between an idealism common to alternative critical pedagogy, and to young teachers both of which become more tempered and strategic at surviving in an alien institutional system on the one hand, and the hegemonic forces of institutional setting and ingrained colonialism of others' consciousness on the other hand. The density of this hegemonic world is ever present, its cynicism is corrosive of young minds and hearts and it is a continual consciousness to guard one's students and oneself against

In a sense, Mike's conceptions of (critical) social studies theory and practice is dialectical as is his view of coming of age in the industrial culture around us. No particular social arrangements, for alternative societies or institutions are expressed by Mike. It's not certain that he feels social structural transformation is necessarily an outcome of good citizenship. Clearly though, structures do condition chances and persons do tend to resist them in Mike's view. Habermas (1979) and Kohlberg (1971) might well classify what Mike has said as an ethical-principled orientation in which moral freedom and universal obligations are expressed through an unfettered consciousness. What we do in conduct if we cannot have things that way is another question or another level!

Habermas argues that as moral consciousness becomes more globalized or comprehensive it follows a hierarchy, empirically documentable, of increasing reflexivity, abstraction and differentiation, and generalization. "Deeper analysis" of consciousness and in understanding of the contents of speech could reveal many tendential capacities for awareness, for relationships, for political moral conduct, and for identity restructuring; issues that we cannot discern or determine with any confidence at present. " (Either we run from the spurious charge of 'unethical psychological manipulation' of subjects; or, we have been unable to conceive developmentally what

consciousness shifts entail for praxis.)

The participants' accounts in the preceding pages are less an instance of lifeworld analysis than they are an impressionistic content analysis of themes that this study has explored. Clearly, if the analysis is more deftly produced then we can call it phenomenology. If it is not the semantic-historical content of the ideas can still be assessed for its political and conceptual relevance, and the force of their motive-forming power as norms of critical practical inquiry. Equally, inquiry could take a sensible middle ground between Scylla and Charybdis and investigate the performative and 'illocutionary force' (Searle, 1969) that obtains through the use of these words, by these kinds of participants in theoretic and practical discourse. This kind of analysis would be one gauge by which to assess the 'kinetics of possibility' if such semantic structures were part of a discussion leading to discourse in (critical) social studies classrooms. That way, we would know whether our strains of bourgeois idealism were tripping us up in our pedagogy and curriculum planning or whether they do still contain the revolutionary communicative zeal of the enlightenment - transposed to a post-Marxist cultural-political environment.

At the 'bottom line' these portrayals of the insides of teachers and students in critical social education serve to show the range of consciousness that is commonly distributed across organized education. It means that in radical

curriculum reform and development that a sensitivity to where your participants are cognitively, politically, and morally is vital if persons are not going to be excluded in any democratic transformation of curriculum practice.

It reflects a hallmark of the commodified, estranged culture of the age that each of us in isolation expresses an image of the "beautiful illusion" with the same words and feelings yet not realize that each of our truths about criticism and change are tragically undermined.

Habermas (1979) attempts to remedy the tragedy by speculating on the transformation to "universal ethics of speech." In contrast to the deep consensus achieved in forms of public discourse where preference structures are combined with external interpretations of political society, in a universal ethics internal nature, as well as external nature are deeply and systematically "drawn into a discursive formation of will" (Habermas, 1979, p. 93). In less mature, but still imminent in our society, forms of public discourse subjectivity is analytically or monologically dissected by the interpretive sciences, basking in the light of revealed cultural traditions. Once the subjective contents are laid bare, they are pickled and encoded in textual, museum-like objects. (This, of course, is the brunt of Habermas' dissatisfaction with Dilthey's hermeneutics).

In this conception of educational practice, as a universal speech ethics, subjectivity is rendered free of objectivating cultural contents. By allowing its often

unsymbolized state to free associate with the person and persons present allows it to be granted interpretations for the subject person that are practically optimal; that is, interpretations that are not tied so much to the sedimented 'dogmatic of 'beautiful' cultural interpretations but to the possibilities of a new aesthetic and political domain. (This could be the utopian social arrangements and consciousness anticipated in all critical social education.) "Aesthetic experiences" which social studies pedagogy can become, as we see from the participants interviewed, are typically bounded normatively and axiologically by historical sediments. With the model of a universal ethics of speech participants in communicative pedagogy (that is, non-monological, non-repressive) express an openness to others' internal nature, and sentiments, surrendering ego to each other and something of themselves as part of a social praxis (on gas plants.?). Because self-identity, or ego, or the organization of consciousness is an imperial arbiter of cultural tradition and practical interpretation, its supremacy is dissolved by persons surrendering to each other under universal ethics. Pedagogy as with

Autonomy that robs the ego of a communicative access to its own inner nature also signals unfreedom. Ego identity means a freedom that limits itself in the intention of reconciling - if not of identifying - worthiness with happiness.

(Habermas, 1979, p. 94)

FOOTNOTES

1a. Socialization of the Growing Child - Developmentally Ordered

Qualifications of Role Behavior

General Structures of Communicative Action

Cognitive presuppositions	Levels of interaction	Action levels	Action motivations	Actors	Norms	Motives	Perception of Actors
I Preoperational thought	Incomplete interaction	Concrete actions and consequences of action	Generalized pleasure/pain	Natural identity	Understand and follow behavioral expectations	Express and fulfill action intentions (wishes)	Perceive concrete actions and actors
II Concrete-operational thought	Complete interaction	Roles, systems of norms	Culturally interpreted needs	Role identity	Understand and follow reflexive behavioral expectations (norms)	Distinguish between "ought" and "want" (duty/inclination)	Distinguish between actions and norms, individual subjects and role bearers
III Formal-operational thought	Communicative action and discourse	Principles	Competing interpretations of needs	Ego identity	Understand and apply norms (principles)	Distinguish between heteronomy and autonomy	Distinguish between particular general norms, individuality and ego in general

CHAPTER 10

FOR THE SOCIAL STUDIES AND CANADA

This study has investigated the political motivational limits and possibilities of curriculum reform as one means of social and educational accommodation within organized capitalist society. Social reform and its cultural derivatives such as curriculum innovation, development, and evaluation become one important dimension of hegemony in capitalist society. Social reform has to be understood historically as the outcome of early liberal and welfarist provisions for sustaining working class productivity and mass loyalty to an economic and social system which, from the late nineteenth and early twentieth centuries in Europe and North America, became increasingly disruptive of communal and family life. It is difficult to argue, from the analyses in this study, that it was the state and its ascendant classes which emerged full-blown in the early twentieth century with a surfeit of virtue to bestow on the immiserated underclasses.

If economic development and socio-cultural initiatives are understood to keep pace with one another, despite contradictory developments, then welfarism and liberal socio-cultural adjustments have worked historically to even out capitalist disruption, to secure productivity, to sustain loyalty and motivation, and to repress or sublimate popular dissent. It is important that the history of liberal, intervention reforms in capitalist societies not be lost in

the scuffle of helping groups in our society that range from educators, to psychiatrists, to social workers, to transition houses and so on. To see that the piecemeal reforms of social democratic legislation, in this history, always promise more than they can deliver is not due to the malintentions of such persons behind them but because the logic of the reforms, their limits and possibilities for personal and collective gain, are primarily determined by their unreflexive entrapment in the capital-labour antagonisms of exploitative class relations. I do not argue that counter-initiatives are impossible or that resistance is a wild dream but that we as particular persons, with the future as a responsibility on our hands, must come to understand what we face in corporate-capitalist hegemony whether of the first or the fourth world version. I risk sketching a determinism of all too gigantic proportions as I write. Yet I sense that as our lifeworlds are progressively eroded and commodified by instrumental-production relations we lose the ability to tell appearance from essence, or the ability to judge our instinctual needs and social interests from what is made available as a dominant array of choices. As our motivational capacity and ego autonomy dulls, so does the means to secure or even assemble ethical questions about current practices in social planning or capital deployment. Both Habermas (1970) and Schroyer (1973) refer to similar developments in the social structure as the "refeudalization" of productive relations. The "refeudalization" of the individual is achieved when consciousness and economic conditions

become the opposite ends of a calculable social equation while society's members are maintained as low-energy human factors in the middle. To recognize that the crises of social life under organized capitalism are not fully thematized yet, although Russell Jacoby in Social Amnesia (1975) as one, does a fine job, and that 'refeudalization' of the individual as it occurs is a psychological, and economic phenomenon means that human science inquiry must not stoop at this juncture to a false reduction of intellectual interests or neutrality. Ever widening discursive scope through transdisciplinary commitment and the re-politicization of our researches are responsibilities that any human science which glimpses these tendencies must bear. In educational inquiry, and in curriculum theory, in particular, we are curiously located at one of the critical fronts or sites of reproduction for consciousness, for value-producing labour, and for domination. Historically, and morally we have been charged with leading the naive nurturantly and carefully into the future. If we have been open at all to the meaning of inquiry in human science and curriculum studies in the last decade, and to the work of recovery and revelation on the social, political, and psychological tendencies present in the cultures that we inhabit, how can we not act practically or deeply? But if we have not acted, is it because of privilege, or comfort, or fear, or is it because Habermas' dictum has come to pass and that we live in a lifeworld where reasons that justify decisions are no longer necessary?

As such curriculum reform, as this study has described it, must be identified, understood, and superseded in practical, organizational ways if educational workers and students are not to contribute unwittingly to the reproduction of a society grounded in stratification of all social relations, economic-political exploitation, and the denial of opportunities for personal, collective, and global self-formation.

The study develops a central methodological principle identified as practical method that has drawn from traditions of critical social theory and political philosophy. The practical method understands the resistance and supersession of the consciousness and practice of liberal social reform as an interest in social political transformation for emancipation. As part of a tradition in intellectual history, of critical practical philosophy, its implications for analysis, critique, and action continually recur through the study as it is written and as it is read. The practical method implicitly presupposes that analysis and criticism must be conducted simultaneously and that the reconstruction of consciousness, of text and theory, and of conduct must now be an ongoing reflexive project within the study. This understanding comes about due partly to the tradition that the philosophy of praxis imposes on subjects and objects in their reflexive preparation for political conduct but also due to the nature of the world we presently live in. To understand organized capitalism and the deformation of the social cultural realm and of the individual within it, means our prac-

tical tasks, in education for citizenship, are deep and urgent. Identification and resistance in our cultural political renewal are key moments in this inquiry and in our community and curriculum publics. The usual recommendations for action, or policy shifts, or continued research efforts that are typically found at the end of a long excursus on the social or educational worlds are made throughout this study. The prescriptive work done in this study inheres in the very texture of its analyses, choice, and style of problem-posing. To be sure, I can extract elements of research and of policy for future curriculum theorists and developers to be watchful over but if this tactic is overemphasized I risk deforming the study, for itself, as a critical piece of enactive reflexive-structural analysis. Organizing this study, with a conventional problem, its description set against some normative standard, and a set of practical recommendations distorts the essential praxical nature of doing true praxiological inquiry. The activity for the latter kind of inquiry is restored to its source - the reflective-enactive reading subject who is already part of a living community in an ensemble of social relations of power and resistance. It is this recovery of who we are as acting critical subjects already, in our constitutive essence, that forms part of praxiological work. It is the recovery of our consciousness of these capacities behind the appearances that organized political cultural life has thrown up around us that is penetrated in the grand refusal of negation. That is, the refusal

to participate and condone the 'progressive' estrangement of our species capacities that is accomplished through commodity relations, positivism, technical-scientific panaceas, privatism, patriarchy and so on. The refusal, then, that practical method sponsors is a constant overwhelming denial to participate in text, in speech, in intimacy with others, and in political conduct that severs our remembrance of human interests from our practical work. To this end, practical method convenes four fronts of inquiry into the different levels at which social-curriculum reform is constituted in society, in communities, and in consciousness. Practical method couples analytic perspectives of curricular traditions, social structure, and consciousness with the normative reflexivity of readers, the curriculum community, and the investigator in the practical organization of revolutionary political conduct. The study takes up the democratic call, which in our time has become a mere shibboleth, for citizenship preparation through the schools, by identifying and determining the critical civic competencies that persons now require to restructure public life for generalizable interests. To establish democratic, deliberative publics that nurture personal and collective identity formation means to identify, to resist, and to undermine immanently and 'projectively' the dominant forms of cultural incorporation in organized capitalist society. The kinds of analyses that practical method encourages and practices weave together an iconic unity of human inquiry that the praxiological tra-

dition presupposes is necessary in order to know what, to know how, and to know why resistance must be conducted as a multiplicity of practices concurrently. Human science must mirror the deformities and complexities of organized societies not so as to describe for posterity in a sort of epic novel format but so as to rationally understand them.

In Ricoeur's sense, to understand deeply and totally also means that the text mediates the concrete transcendence of these contradictions by affected persons. Because the social totality, whether historically deformed or not as to its expression of human interests, is a configuration of different levels of practice, I have found it necessary to conduct inquiry along lines that approach these levels as well.

Clearly, the history of curriculum reform, as I portray it, is constituted and experienced in our own consciousness as living, intentioned persons. We experience the cultural sediments of reformist thinking in curricular text, projects, and research. Text, projects, and classroom relations are strongly mediated by the structural forms of particular political economies in organized capitalist societies which in turn throw up reproductive symbolizations around institutional life. Praxical resolution of these contradictions of human interest at the levels of the lifeworld, and the collective density of social structure means a sustained re-conceptualization of our traditions of theory and practice in curriculum development and social studies education. Critical-practical conduct is an organic response for practi-

tioners and citizens to recover the contents and energies of our conscious self-formation, in this culture in Canadian society, as a result of these compelling insights of self, schools, structure and culture. To this end, practical method links the first three kinds of analyses with promotive, educative, non-instrumentalist projects of deliberation and conduct in social education. Each interest in this inquiry reciprocates in a mutually informing way with the other such that description, analysis, and understanding lead to organized conduct. Each of us in our capacities as citizens and practitioners feels and resists, if only gropingly, the relations of domination, at each level: the existential, the cultural, and the structural. Since each of these levels of complex practice prefigures our work and its possibilities in curriculum development, in some way, it behooves us to take note of these contingencies to dialectically incorporate, but not surrender them, in our work.

In the same way that the contradictions of our social structural and psychological histories are incorporated in the form and substance of this study, so too is the way that the community of readers internalizes this text as a dialectical process. The text is organized into three parts each of which correspond to a succession of moments in the praxiological inquiry of curriculum reform. A first part of the study comprises the revelation and extent of the problem of reform for citizens in organized capitalism. The ideological, economic, cultural, and epistemic dimensions that se-

cure it as a problem of mundane consciousness are demonstrated. A reflexive inquiry into the nature of method and competence required to transcend the problem is begun. Its biographical precedents within this investigator and its historical precedents in critical social theory and political philosophy are linked with the need to understand culture as a material force and the necessity of its continual political transcendence. In one sense, Part One already 'practises' the moments of the practical method at the same time as it speculates on its foundations in the social studies curriculum communities in Canadian society. Part One, in the sense I give it, is the problematic or thesis.

Part Two contains analyses that begin to actualize the moments of the practical method (immanent criticism, negative dialectic, public discourse) to the degree that the problem unfolds conceptually. In other words, the inner history of progressivist social education, the conceptual-ideological analyses of paradigmatic liberal, democratic social education, and the structural analyses of the political economy of the state are instances of the historical manifestations of the problem of reform. They are manifestations in as much as they become encoded as appearances which we as persons must reconcile or account for in our curriculum theory, pedagogical, and citizen communities. This does not suggest that we consciously embrace or reject these formal contours of curriculum, pedagogy, and reproduction but that, as relations that shape our professional

and personal lives, we nonetheless account for them as determining appearances in our work. Hence, to know them ideologically, conceptually, and practically is to recover some aspects of collective self-formation - that is, to begin to repatriate consciousness. In another way, by recognizing the historical manifestations of progressivist curriculum thought, liberal democratic pedagogy, and political economies we rebuild curriculum development with a greater wisdom and humanity than has ever occurred before. This means it allows us to step away from the spurious professional vocabularies that teachers, academics, and planners slavishly adopt as the unwitting reification of educational identities. Part Two of the study practices both immanent criticism and negative dialectic, as I have described them in Part One. To understand the extent of instrumental rationality and its function in our society I pick the threads of progressivist history showing how reconstruction is so often a term of apparent progress. I extend this analysis to contemporary instances of liberal progressive pedagogy under the Public Issues rubric of social studies teaching. I have used the opportunity with practical method to problematize, under the auspices of negative dialectic, the particularity of subject-object relations embedded in paradigmatic texts and models of Public Issues pedagogy. Thirdly, the structure and activities of the organized capitalist state are reviewed as are the crisis tendencies of reproduction and legitimation that fall as 'compromises' of rationality on all our heads in this

society. Functional analysis and immanent description combine in an understanding of the contradictory tragedy of accumulation and intervention as relations that penetrate and pin us in our relations of reproduction whether at the sites of the school, the workplace, or the family. I then draw the analysis of the impact of state intervention to its sharpest point of reproductive penetration - the communicative-organization of motive-forming action. Negative dialectic provides an understanding of how our use of seemingly innocuous cultural residues split-off from earlier forms of civic life risk confining us as curriculum persons, as students, and as citizens to a life of angry, private rage and powerless, political retreat. Analysis reveals that as the structural contradictions of accumulation and legitimation sharpen, or social pain for private gain, as empirically they appear to be, socio-cultural crises will in turn become more severe. In the calculus of historical outcomes that I discuss, it is none too clear that the thrust of state convulsions will be toward generalizable interests. We risk a scenario in which as teachers and curriculum theorists we will 'supply' skills and competencies to students that would sever their need for public or personal approbation of state-corporate policy for the future of the species. The moments of immanent criticism and negative dialectic, or functional historical analysis, and conceptual-ideological criticism are indissolubly linked as necessary lines of inquiry in a practical method oriented to the communicative organization of political conduct.

They are useful in the recognition and penetration of the historical problem of reform and intervention in our everyday life while providing the empirical knowledge, linguistic and motivational resources to humanely and deliberately reconstruct curriculum practice.

Part Three of this study concentrates on the organization of public discourse within curriculum communities, public interest groups, and teaching and learning collectives. As a third moment of the practical method it relies upon prior efforts at problematizing, and at reorganizing the historical appearance of practices which have led to the deformation of social communication - amongst affected persons. As one moment in a dialectical methodology of radical social inquiry, it temporarily resolves the contradictions of a history of antagonistic social relations for particular publics of participants. This means that strategies for overcoming contradiction in curriculum development or social education can be pitched at the level of local groups, across groups within an association or with those who have determined their shared interests. Equally, it can be a series of different alliances with labour groups, minorities, professional associations and so on at a regional level. Indeed any political conduct that springs from public discourse, as an organizational principle. Each of the moments in practical method requires the other in this process of the organization of enlightenment. What this means is that public discourse must refer to deliberative decision-making that rests on the maximum amount of empirical know-

ledge and interpretation that can be produced through extensive ideology critique and functional analysis. To be sure, public discourse, as I see citizens, teachers and learners and so on engaging in it, involves practical and theoretic discourses depending on social circumstances. Discourses in the final analysis tend typically to determine the empirical and rational bases of their knowledge at hand but discourse, in itself, does not generate strategic knowledge, for instance, of the motives or interests behind the restructuring of a curriculum design on social action, or say, the structural conditions that dispose a provincial department of education to develop and implement menacingly a blueprint for a core curriculum with mandatory teaching contents. To act with wisdom and with 'street sense' means to have access to specialized analyses of social system operation, its contingencies, and the kinds of procedural knowledge for curriculum development that would lie closer at hand to informed publics. The more that strategic knowledge, historical analyses, and knowledge for the particular program development or evaluation problem are amassed together in the organization of the public's communication, the more acute the consensually-derived outcome will be for that group if it decides on political conduct. The importance of gaining legitimacy and power from a history of acute reflective action or praxis cannot be underestimated as a force for alliance building and momentum. Public discourse can, of course, become a contributive source to the work of

functional analysis or ideology critique that theory or development projects in curriculum could use. The deliberative outcomes of public consensus and the experience in struggles or alliance formation are important contents that more strictly intellectual work has difficulty to generate.

The two moments of immanent criticism and of negative dialectic can progressively inform the public discourse of groups engaged in curriculum deliberation. The first moment can alert the curriculum research community and decision-making by outlining the repressive, functionalist aspect of political-cultural manoeuvres initiated by corporate-state interests, school districts, or other political bodies that would act to blunt consciousness in teachers, learners or affected citizens involved in curriculum work. Among the outcomes of negative dialectic is the continued watchful analysis of object, or text relations. In radical curriculum reform or development, publics are interested in securing cultural contents and methodological principles that are progressive, rather than regressive in the kinds of social-moral relations they might convene in pedagogy. Different moments of practical method yield elements of consciousness, culture, structure and even strategy that are non-ideological rather than counter-ideological in nature. The contents of Part Two of this study are cultural and structural contents that have been stripped of their regressive, deformed character as particular objects for other social regimes of exploitation. Public discourse represents a final valida-

tion test of these cultural objects as to their progressive promotive character as dialogue or semantic universals. Public discourse as a particular organization of communication can act as a normative standard for the quality of communicative action that is sanctioned in curriculum theory collectives, development projects, or in closely related classroom pedagogy in social education. Whether there are political contingencies that participants in these encounters are unaware of or which should be thematized, or whether persons' own subjective interests do not receive as optimal an interpretation as could be done, or whether analyses of social structural factors, or hidden dimensions of curricular content have not been sufficiently elaborate to disclose the social or epistemic interests at issue are points of intervention that public discourse can make in collectives organized as practical method. The third part of the study begins to pick up on communicative practices, progressive cultural-pedagogical elements, and incipient organizational forms that best contribute to discursive forms of curriculum development. I have drawn, in the case of critical social education, from progressivist-reconstructionist histories, from ideological-conceptual analyses, from social structural analyses of crises tendencies in the society, and coupled this to a reflexive biographical organization of my interest as an investigator who inhabits curriculum research networks that can be politicized; that is, to use the most obvious example of this study. Part Three draws integrally and strategically from the lifeworld concerns of others as

participants at different fields of practice and consciousness in social education. These perspectives and interests also become key correctives to ongoing discursive curriculum projects for they allow the intervention of all participants who are able to purchase a structural share of the group deliberations. This communicative action cannot rest until an unconstrained, deep consensus has been achieved on decisions and conduct in the arena of curriculum development. Public discourse in this context promotes the recognition that persons enter with commitments, consciousness, and cognitive competence that varies widely but which must be vindicated as real claims, from these persons, of authenticity, appropriateness, and comprehensibility. Unless such claims are deliberately redeemed or discarded for all participants dealing with all cultural, political, and curricular themes then the history of monological, repressive, reformist curriculum decision-making will continue at an even more congealed level of reification.

The chapters, then, in this part of the study, take the symptoms, manifestations, and mechanisms of curriculum reform to a new stage of normative-practical resolution or transcendence. Critical social studies education, prototypically, becomes the social analysis of unfreedom in organized capitalism and the political practice of freedom through revolutionary transformation in regional socialism. Radical curriculum development and its homology of critical social studies theory and practice contributes, textually,

culturally, and politically to the organization of discursive will-formation on matters of political conduct in curricular and community publics. As part of a wider strategy in political education the appeal to the integration of regional and global popular dissent is made as one counter-initiative against the hegemony of capital and the Canadian state within North America, through its supplantation by participatory socialist democracy.

Conjunctural historical analysis, such as this study can be said to represent, demands for methodology a commitment that is simultaneously normative, conceptual, and practical, or political. It must empower those which its use seeks to relieve, through their self-chosen interests from dependency and repression, at the same time as it understands how it is they are situated in relations of domination, presently and historically. As educators and citizens we are likely to be in various stages of dependency or distorted consciousness' ourselves living as we do in Canadian capitalist society. We are all faced, as sometime relatively privileged persons, with the choice in our work projects of being well-serviced and 'bought off' by our institutions through rewards or prestige or, we can choose through 'accidents' of biography, performance, or self-imposed marginalization to demand a better life for ourselves first, and for those of our friends, and fellow citizens beyond us. This is always a choice no matter what arguments 'good hearted' determinists would try to advance. To reject the 'bad faith' of our

institutions and particular histories of exploitation and neglect perpetrated by some of our intellectual traditions in the high bourgeois world is a decision that means we demand reasons for research choices, reasons for school and curriculum policy, and reasons for the intervention of the state whether through taxation, social reforms, or the police. Justification demanded and achieved is likely to be met with silence, repression, or the proliferation of more reforms that head-off demands for social justice, and de facto participation in civic affairs. This is why traditions of research, intellectual debate, curricula of dissent, protest, and reconstruction, radical school-community projects, and the development of public voices and conversations with communities are vital counter-cultural and political initiatives for stirring civic and regional democratic participation. Practical method as a composite of critical-practical traditions, represents one methodological kernel that can mobilize persons from a multiplicity of reproductive sites in the society from different social class positions and occupational hierarchies, and community situations to recollect and recover the traditions of the deliberative public sphere - as the practical organization of their destinies.

Practical method in the context of this study as the organization of reflexive, social inquiry has thrown up different kinds of insights and implications for understanding and superceding the elements of curriculum reform that are ideologically regressive for our minds and bodies

as persons who inhabit a contradictory culture. We all risk catching sociological vertigo, as John O'Neill says, by standing in this culture and being overwhelmed by its density and possibilities. I propose that one device to cope with this vertigo can emerge by conceptualizing how the aspects of curriculum reform-as-social reform, that I have alluded to in this study, intersect with three mundane or at least, conventional and imaginable levels of social practice: the regional, the cultural, and the individual.

REGION Regionalism stands unequivocally (sic) with the particular against the universal designs of imperialism as the ideology of the universal, global state. It first appears as nationalism limited by the boundaries of the nation-state but through a process of economic and political expansion it goes beyond the ethnolinguistic boundaries of nationalism to subordinate other nationalities. Can regionalism, like nationalism, evolve into imperialism? Theoretically it could...But this is unlikely. Without the structure of a sovereign nation-state the evolution to imperialism is impossible. And it is this nation-state structure that regionalism rejects for itself...Once regionalism is open to socialism a dialectic begins that leads beyond the ideology of radical regionalism to an ideology of indigenous socialism. (This political-cultural) form situated in Third World liberation ideologies is the emphasis on self-reliant economic development, autonomous and indigenous cultural and social expression, popular control of the economy and political development toward equality.

(Melnyk, 1981, p.81, 103, 104)

The western Canadian writer George Melnyk has argued passionately over the last few years for a renewal of identity in Canadian society. He poses this project in regional terms

and argues that the social, political, and economic malaise that citizens now acutely experience is due, in some measure, to living under a system of neo-colonialist imperialism that characterizes both the dependent nations and the developed nations. He develops the thesis, known in other circles as the centre-periphery or metropolis-hinterland theory of underdevelopment, that Canada as a society is best understood not as a politically-integrated nation state but as a collectivity of regions which have a particular economic, political, and cultural relationship with a dominant centre - in our case the federal state and corporate-financial interests centred in Ontario. This relationship, historically, has been one of dependency between the centre and the hinterlands which in Canada's case are the identifiable regions of the maritimes, and the prairie west. The dependency relation as such has evolved to a point that cultural and economic autonomy has been there in name only while the basic flow of capital, profits, ideas, art, and control has been to the centre at the expense or the impoverisation of Canada's regional hinterlands - psychically, economically, and politically. This basic relation between the regions is one established as a pattern of British settlement and economic development in the post-conquest years when the Canadian economy was based on staple production, extraction, and export to value-adding centres.

Regionalism, Melnyk (1981) maintains, is a more faithful representation of the historical and social fabric of the

Canadian collectivity. Political boundaries imposed upon the land by the Canadian federal state reflect the centrist interests of domination. The integrity of Canada's regions, rather than its political-administrative boundaries, are marked by commonalities of historical and geographic factors, cultural-linguistic groups, environmental and productive conditions, and a shared history of exploitation. Regional imagination and understanding as the particular units of shared identity and autonomy hold more powerful sentiments of tradition and interests than the atomized, administrative jurisdictions of metropolitan planning and extraction. To this degree in this scenario can also be held accountable for the underdevelopment of indigenous regional structures despite their established right to own the historic Canadian surplus value.

Regional indigenous identity and structures are necessary to the development and political development in the north. For all its recent political developments, the north has not been able to provide and reconstruct a sense of regional identity and political development. The north has been a peripheral, extractive region of the Canadian state, and its political development has been a function of international expansion and contraction. The north's development that has been a function of international expansion and contraction.

Regional development in the north and Atlantic Canada has been a function of international expansion and contraction. The north's development that has been a function of international expansion and contraction.

that are distinct from central Canada and its metropolitan interests - identities that have been suppressed through a number of circumstances. Regionalism demands that the particular cultural axis is the region rather than the locale or the province that persons inhabit. It becomes the socio-historical unit of renewal and change. Federal-state-regional relations need to be reconceptualized, along the line of persons' real interests in order that political control, services, and fiscal arrangements reflect those priorities. Local-regional groups must become the contributory sources of cultural activity, social policy, and economic planning for entire regions. Local political elites must be seen as the compradors of central-state and continental interests. Regional autonomous development needs to be undertaken through cultural and economic revolution in the recovery of suppressed values, historic interests, artistic and intellectual practices, and the deployment of a radical spirit of a social and ethnic influence to society. This process will involve the development of a regional political and cultural institution, a regional center of the region. These institutions will support the deliberative control of the region and the people of the region over the form and content of their regional political and social relations, as well as the history and the political life of the region. It will promote the development of a regional political and intellectual life and the development of a regional cultural forms that will be able to support the development of a regional political and social life.

cultural expression and practice have always been suppressed by imperialist dependency relations that prepare always someone else's culture for consumption and commodification. This has certainly been the history of aesthetic tastes in the west, and the maritimes.

Ethnicity, language rights, nationalisms, and cultural differences amongst persons are used in nation-states, as is the case in Canada, for the contradictory functions of securing identity differences and for social control. Habermas (1975) amongst others demonstrates how the state manipulates cultural traditions, detached from the means of economic and political determination, so that persons turn in upon themselves, as minorities, seeking solace and retreat with groups from the 'homeland' in the district. Viewed as a local or central state measure of cynicism, ethnicity and multiculturalism are welcomed as 'richly diverse expressions of our people' in a unified land. It is appropriate to participate in state-sanctioned cultural exotica but not appropriate to participate as multinational Canadians, on their own terms and interests, with full freedom of expression in socio-political life. The kind of everyday citizenship permitted ethnic groups in Canada represents, fundamentally, the default definition of Canadian society. The practice of this kind of citizenship reproduces the relations of assimilation, marginalization, and hyphenation that have always characterized Canada's neo-colonialist history of its hinterland peoples and ethnic working classes.

The regional renewal of cultural imagination and political expression that I propose would be a transcultural, socialist form of organization that would develop in each of the regional hinterlands of the country. The precedents for this kind of movement are developing more acutely in the west at present. The rise of the Western Canada Concept Party is an instance of conservative regionalism while the Parti Acadien in New Brunswick is a kind of politics further to the left. The stirrings of the European Green Party in British Columbia represent not so much a particular regional response to internal imperialism but their ecological, anti-industrial, decentralized political platform is an important counter-initiative for any political re-organization of Canadian politics. It is important that political discourse be taken out of the conventional electoral framework that occludes the depth of the issues for the public-at-large. Each of these instances of political, cultural or artistic movement, although for disparate, locally organizational goals, all point to the need for a new political structure that

...condemns the political economy, the class structure and the dominant society that Canada impose on the (Pacific Interior, the prairies, and the west coast) in the 1970s.

October 1981

In the ultimate, the interests of the people of the west are served by a political structure that is not based on the interests of the dominant society.

mental secessionists in all but name. The most strategic, historical alliances for the future will be between regionalism and socialism since it is this political-cultural amalgam which will undercut the dependency relations of domestic and international imperialism in Canada. It is this amalgam that recognizes and mobilizes for indigenous alternative developments of regional popular interests. Because political and cultural expression based on regional socialist models is rooted in the particularities of cultural objects and consciousness that persons living there can identify with, sentimentally and motivationally, then concrete validity of intellectual work is confirmed to the degree that it extends their generalizable life interests, as regional inhabitants. To the degree that it does not resonate with regional consciousness as the consciousness of their true interests its educational or promotive tendencies fail. Such work then must then be cast upon the garbage heap of intellectual opportunism or else the conditions for regional socialist process must be re-thought for local circumstances. Radical curriculum development based on practical method intersects with regional social practice through:

1. The development of regional research networks in curricular development and theory that openly express regional sentiments, deliberative decision-making, and qualitative analysis.
2. The development of alliances with political interest groups such as womens' movements, students, the ecology

movement, labour organizations, and electoral politics, and community organizations committed to regional political organizations.

3. The concerted effort to achieve public voices that are heard and received as articulate, socially critical analyses of 'issues' on schools, curriculum policy, and society linkages. To build the structures of community public spheres, once again, so that they become deliberative-decision-making forums in parallel with the state and local political elites is part of alternative curriculum development.
4. The development of curriculum co-operatives based in school districts, teachers' centres, educational faculties, and independent curriculum-writing that encourages the regional and global transcultural socialist perspectives in content are necessary components of a regional vision.

CULTURE. The identification and understanding of the cultural level is an action to bring it closer to self-awareness and therefore to the political, to recognize in the materiality of its outcomes the possibility of the cultural becoming a material force. Such a politicisation of culture is actually one of the pre-conditions for, and an organic element of, longer-term structural change. It is specifically in the cultural area and in its characteristic relations with the ideological, that there is indeed the possibility of effectivity at the cultural level in the pedagogic mode. The recognition of commonality in cultural forms and the understanding of their own processes is already to have strengthened an internal weakness, to have begun to unravel the power of the formal over the informal and to have started a kind of self-transformation.

Much of this study has been concerned with an analysis of cultural forms in the society we inhabit. I have portrayed historically how cultural forms are distributed socially, how they can be processes of social critique, as well as social accommodation in consciousness and in institutional life. The study problematizes curriculum reform as a subset of liberal interventionist social reform and its derivatives in social education. It is important to look at curriculum reform, in our society, for it is an intervention which as a cultural form potently aids in the reproduction of dominance, conflict mystification, and the accomplishment of closure in social consciousness, debate, and personal efficacy. As a cultural form, curriculum reform has many empirical manifestations and interconnections with other cultural traditions of the society. The fact that curriculum practice is strongly mediated through state political and economic relations forges its role for social reproduction in general, as well. The study has been careful to point out how the social, cultural, historical, and social psychological intermeditate in complex ways to produce in space and time certain normative social outcomes - which we could call a particular society. However, I also implicitly claim a creative or critical-practical role for cultural forms themselves - that is, in the organization of resistance. Part Three, of course, is concerned precisely with the pursuit of this question right in the hard face of structure. The reflexive analysis of cultural forms, their distribution

and historical production, however convened, are all sites for accommodation - reproduction, or retreat. The degree to which any of these latter social outcomes are accomplished in schools, in curriculum development, or communities vary from total determination to no determination of persons' action.

I have made the case, then, for the fact that the cultural forms, in communities of curriculum and reform, do have a material force and can act for persons in decisive ways. Hence cultural forms need to become a significant topic of research in human science for education, as they must become a strategic, non taken for granted consideration for those organizing political action. Any cultural action taken through curriculum for instance; refracts in different ways in institutional contexts such that, say, jurisprudential teaching method while formally 'progressive' for certain classes of students may act to further paralyze or occlude understanding on the part of ethnic class, or 'underachieving students' and so on. Although, jurisprudential method may reveal the rich traditions of past bourgeois, discourse class and to this provide an insight into historical causalities of power in communities the students live in, such pedagogy may be discriminatory for those students who take it seriously enough to apply it to school administration or in authoritative decisions in their new jobs. Nonetheless thematizing the cultural in this way, in curriculum development or in our research communities usually reveals its strong ties with the structural calculus of reproduction and resistance.

This empirical-practical link of the cultural or curricular with institutionalized social outcomes say, of student achievement and aspirations, and eventual actual social placement should not condemn any counter-cultural initiatives as naively or hopelessly utopian.

One of the more unfair and lazy charges that critical social theory has to tiredly fend off is that it is too idealistic, and rationalistic in orientation to ever inform the peoples' practical projects. Similar, essentially ungrounded charges are made against the motive power of alternative or critical curriculum theory as either too esoteric in its language or in its understanding of the determining power of 'structures'. These charges are usually expressed by the personality types of the 'realistic liberal' and the 'constipated Marxist' respectively; both are confounded plainly and simply. What ought to be declared to the conventional research community in education is that all research 'positions' are embodied social relations to begin with. They are indexical summations of power in the society; that is, whether the power to sustain domination and exploitation or the power to sustain revolutionary cultural transformation, or only the power to sustain partial critique and movement of some citizen groups some distance through particular cultural projects. Public discourse becomes one access point with which to see the power to restructure structures, ab origine.

I make this plea to practitioners, theorists, and

developers alike, in curriculum, to listen to work of this kind and to begin to appreciate the power of cultural reformation, and its internal contradictions, as Adorno well knew, to prepare new organizational forms and consciousness. Curriculum theory and development as traditions of citizenship preparation sit squarely in the auspices of the cultural and its renewal. Curriculum theory and curriculum development mediated by a practical method supply sponsorship to the everyday integrity struggles of teachers and students in the depressogenic environment of schools, and lend strongly to longer-term historical struggle in the humanization of schooling and civic life by ideology critique, utopian cultural production, and the communicative, structural organization of conduct. To give up on practitioners because of their embarrassment over their daily drudgery, or, to retreat to the people themselves because what can we do about society as it is! only reinforces the logic and history of reform up till now that good pedagogy strives to combat. To work as researchers and teachers with curriculum theory development, and practice together in the critical present and for our utopian futures involves becoming comfortable with the ambiguities, risks, and contradictions of praxis. In order to know the cultural and political potential of cultural residues and objects that lie latent in their histories means to become familiar with different cultural sources and selections that say, students bring with them from their families or peers, or the histories of protest

repression in the regions they inhabit, or the importation of alternative social cultural solutions for "world problems" that they discuss in class. Projects that are grounded in regional content or in school-community action serve, often unintentionally, to reveal to students their social and cultural conditions within the history of particular communities or regions - whether as immigrant families or indigenous persons. In highlighting their struggles for self-determination or footholds in the Canadian 'dream' these images also help students and teachers to visualize their own social trajectories and possibilities occupationally, economically, or politically. It is quite possible these structural insights would indicate that statistically they are fatally trapped in one niche of the social structure, and thus act to 'cool-out' persons' expectations. On the other hand social analysis might harden, for others, into critique and action as the attempt is made to penetrate the appearance of the form.

It can never be underestimated how curriculum as sets of practices is saturated with the cultural hegemony of institutional life. This saturation extends to affect school organization, pedagogical transmission, the experience of school knowledge, professional vocabulary and so forth such that mere attitudinal or conceptual or humanization shifts in style do not sufficiently erode the reproductive relations of the school in any sufficient way that students or teachers see their social trajectories significantly dif-

ferently. Professional school talk, in recent years, and the focus on core curricula as the 'only way to stem the tide of slackness' represents at best an ideological-sleight-of-hand to obscure fundamental class and capital conflicts; it has very little to do with the internal debates of pedagogy, their integrity, and the development of autonomy and dignity in childrens' learning. Curriculum development and social education as the accomplishment of practical method brings participants 'down' to the cultural objects that they confront on an everyday basis in school and in the family so as to see them as ideological signs or as progressive residues in their internal relations; and as to why these relations have impinged on their consciousness. To do this kind of analysis as a matter of course in their social inquiry means that teachers and students trace the logic of the cultural forms that oppress them - whether as psychological rationalization in counselling and teaching, community, or regional traditions, or as family life. Within the process of dialectical negation developers and students can start to critically assess the particularistic forms that they have embraced professionally and sub-culturally which they have taken to advance their own interests. Willis (1977) points out that the sub-cultural forms embraced by ethnic and working class children in schools may serve as rallying points for their solidarity and retreat rebellion against a clearly discriminatory school system, but as sub-cultural strategies of defiance they ultimately act to reproduce the very system they identify

tities. Melnyk (1981) makes a parallel distinction about cultural exotica as the expression of a defeated identity and indigenous cultural self-determination as struggle. The latter kind of practice can be the basis for developing alternative and independent cultural institutions or schools that express popular, regional sentiments and a radical skepticism of the uses of power in society. However, pedagogy and curriculum selections that are critically-minded are also tactically-minded such that circumstances, contexts, and consciousness of the participants often determine how and when pedagogy can be judiciously shifted to critical orientations. The stridency and ignorance that, today, pervades many of our school debates in the city and the academy are real material forces to be reckoned with. Practical method intersects with the cultural through:

1. Curriculum development and cultural selections in social education that should emphasize regional content, critical histories, indigenous struggles, histories of imperialism, and popular institutions that connect with global awareness.

Social education curricula that need to include as one instructional objective for students competence in ideological and cultural criticism that starts with the most immediate circles of their social experience; not as a 'nasty' element in courses of study but as a life-affirming one. This must be coupled with the social inquiry skills of deliberative decision-making, synthesis,

and generalization.

3. The cultural selections and pedagogical vocabulary encoded in curriculum text that should emphasize relational thinking in historical explanation, social movements, social change, profit, price, labour, leadership and resistance amongst world peoples. Particularly non-dealed topics such as the notions of 'fact', 'truth', 'forces', 'society', 'culture' or 'skills', 'explanations', 'evaluation', 'achievement', 'ability' and so on need to be unpacked as expressions of relations that are intentioned and power laden such that these insights are communicated to students.

4. Opportunities in social education curricula that need to be available for community and regional self-exploration

(students' cultural history, corporate and economic relations) and social action that should be fostered and school program activities that are student-led, participatory in community affairs, that deal with the needs of the community and that are related to the social and economic conditions of the community and social justice.

The necessity of policy documents that take into account students' understandings of themselves and their world, the forms they appropriate (with regard to their own and their school knowledge) with the region, the world and the global network of political and economic relations, and the need to be available

INDIVIDUAL

Considering the risks to individual life that exist, a theory that could interpret away the facticities of loneliness and guilt, sickness and death is, to be sure, not even conceivable. Contingencies that are irremovably attached to the bodily and moral constitution of the individual can be raised to consciousness only as contingency. We must, in principle, live disconsolately with them.... If world-views have foundered on the separation of cognitive from socially-integrative components, if world-maintaining interpretive systems today belong irretrievably to the past, then what fulfills the moral-practical task of constituting ego and group identity?... Does the new universal language of systems theory indicate that the "avant garde" have already begun the retreat to particular identities, settling down in the unplanned, nature like system of world society like the Indians on the reservations of contemporary America?

(Habermas, 1975, p. 120, 121)

The preceding remarks of Habermas help to secure for me the central ambiguity of the individual in relation to schooling, civil life, and participation. The individual is the third level of social practice that intersects with practical method. It is here that critical practical inquiry has to deal with the acute problems of identity and motivation that signal the retreat from public political-cultural activity, to

One of the issues that must concern educators in a critical practical project is that of retreat and estrangement amongst the participants or students it is directed at. It is no longer sufficient for pedagogy to become just critical as a result of an administrative or administrative

cultural insights of curriculum theory must organize the conditions for motive-forming action within students. The basis for making curriculum themes into critical practical questions that lead to non-instrumentalist action is related to whether the normative basis of cultural selection, communication, and political action require rational deliberative justification or not. Habermas (1975) argues that the identity integrity of persons is tied, because of their capacity for language, to cognitive and moral-practical life world perspectives that are at base discursively redeemable. In other words, persons' scaffolding of identity (as a moral-practical and cognitive composite) requires, under present historical conditions, that reasons can be demanded in principle, by them, for the actions of themselves, others, and institutions, that are redeemable through truth. (This argument was developed more fully in Chapter 3) Social action that free floats in a vacuum of the non-discursive justification of truth claims means that, as a result of this institutional process, could accept actions towards them and respond in turn within normated situations to which reasons were attached. The communicative situation, in its original, or ideal, form, for instance, where the sole source of discursive truth claims is historically allied to an early bourgeois liberal era of capitalist society, identified institutionally as the public sphere, is a social situation, which Habermas (1975) feels is necessary for persons to have reasons for actions and

not given, or they are at least not redeemable through discourse, in principle, is tendentially characteristic of the era of organized capitalism and is symptomatic of the systemic imperatives of a society that is taken to function on a decisionistic-steering model (institutional rationalism). Each of these two communicative situations are ideal types (see Appendix 4). Empirically, it is uncertain how closely social institutional life approximates the tendencies of either one. It is certain, however, that differences in world view (as a moral practical dimension) and cognitive perspective coincide with the kind of communicative organization into which persons have been inserted or socialized. As a result the motive-forming base of all social action, or readiness to act, in persons shifts in congruence with the socialization mode. Clearly, the cultural contents that are self formative elements and which are mediated by regimes of socialization are received, understood, and acted upon differently with shifts in these regimes. The capacity, then, to know, to understand, and to act with degrees of awareness as persons in the lifeworld changes according to the linguistic-communicative organization of action. In other terms, the capacity for persons to become cultural does is in relation to how motivating-action is communicatively organized. If a person's identity is considered to be an amalgam of moral practical insights and cognitive capacities, which of course vary widely, primarily communicatively be-
grounded, the desire for social emotional life to be normatively

organized is a real one. Whether instrumental, cognitive capacity is stripped, in our era of organized capitalism, from moral-practical (and emotive) qualities depends on persons, acting in the world, who still strive for consistency and for boundaries by which to guide themselves or to be guided or, it could be said, the need for the illusion of power. Critical theory envisages in its analyses of social evolution and moral development that persons, living in an administered society, will require fewer and fewer decisions or actions taken in their name to be discursively justified in order for them to act. Motivationally, it would mean that persons are highly vulnerable to an intrusive form of socialization or personalized control (Bernstein, 1971) and become disposed to act on the basis of plausible authority, efficiency or simple effectivity. The other effect of this possible 'coup de tete' of socialization is that state intervention, corporate policy shifts, adjustments in schooling, and electoral democracy and other movements in the economic, and political-administrative subsystems would no longer need the active consent, or participation of interested publics. To detach political-economic action from discursive norm-forming traditions means that the problems of legitimation crises dissolve. In such a scenario, under organized capitalism, persons 'participate' in formal democracy through passive consent or withdrawal of revolving political elites. Persons' socio-cultural life becomes further concentrated in an avid, compulsive privatism where recreational, leisure, family life

and somewhat less, work interests are transformed into a revolving cycle of consumption, competition, and reproduction. In a depoliticized socio-cultural realm of retreat into a privatist apathy of analgesia motivation is organized through a linguistic proliferation of goods, services, and status rewards. These contingencies of the socio-cultural realm cannot be extinguished without shifting our conception of human nature. But as human emotive contingencies, or subjectivities they are dysfunctional for political-economic rationalization and planning. The interest, then, at the level of the state, non-conspiratorily I would say, is to sever normative moral-practical action from political-economic awareness or participation with the exception of established elites. With this split political-economic relations retain their strategic-utilitarian interests and socio-cultural life is reproduced, but contained in the privatistic structures of compulsion and self-formation. Contingencies can be mastered in the political-economic realm where external nature is taken to be the adversary. Contingencies such as death, illness, preference and so on in the socio-cultural realm cannot conceivably, for the sake of the unity of persons' identities, be controlled in the same way. If intervention reaches, too far, into communicative motive formation then the balance of legitimacy and readiness to conform in persons is threatened. This is, essentially, a problem of social control specific to the formal democracies of advanced capitalism. Citizenship in this culture means

"prosperity without freedom" (Habermas, 1975, p. 123).

The looming questions that confront educational praxis, in this climate of possible socio-psychological tendencies have to do with how ego-identity and collective consciousness can emerge. Chapters 3 and 9 discuss the correspondences between stages of identity, moral consciousness, and ways of acting reflectively. Would socialization and pedagogy based on a universal speech ethic be sufficient to generate autonomous ego organization and principled moral consciousness over time? Is it possible to develop integrity in identity in contexts increasingly stripped of cultural-historical traditions necessary for the formation of moral-practical and cognitive world views? Curriculum theory and development must brave the darkened world of the unhappy consciousness to determine what organization of communication, at this time, will promote emancipatory, non-manipulative intersubjectivity between others in educational encounters. Are the possibilities for a promotive, non-privatized consciousness in persons possible in the absence of practical roots in the particulars of traditions, community, region, and family? Or, must curriculum theory assume that human consciousness transcendently reaches to a universalist interest in emancipation unmediated by cultural political particularities - such that organization for collective political transformation could be accomplished in discursive projects that were but ideal-rational turns? These are key dilemmas facing radical curriculum theory and

development as it prepares for the future or the end of citizenship.

Schools presently sit at an ideal vantage point to see the epoch-making junctures in the re-making of reproduction practices in organized capitalism. If, the post-industrial synapses of society are to be believed, then social systems are close to a point of steering and maintaining themselves instrumentally rather than practically. If human consciousness in all its contingencies of symbolic mediation, and social labour were the reproductive units of earlier capital formations then the universalistic, cybernetic rationality of decisionistic movement is the grand illusion of the new age. To be sure, planning that operates under an illusion that history no longer has consequence for a life of conquest and progress may succeed in establishing this as an organizational principle, de facto, in the society. The long-term prospects, however, of its systemic survival are poor for as its socio-cultural identity structures 'dry up' the entire system as an elaborated superstructure becomes, in time, very brittle and runs the risk of being capsized by natural catastrophes, entropies, or external social-political threat. However, since we can place ourselves, as caring social theorists and educators at some median point on the scale between absolute social cultural displacement and animism, then there is room for utopian political and cultural theorising. Schools and curriculum entrepreneurship are soporifically, if not strategically

placed, to retrench the bases of community and society-formation in the particulars of ego-differentiated identities, culture, and regional structures. In the long run if identity for persons is not secured in the linguistic-discursive appropriation and generation of culture, then no social aggregates will eventually survive to reproduce themselves, nor to be able to tend to the system requisites of cybernetic forms. The structural contradictions of state, corporate planners and their intellectual 'quislings' have not recognized the imminence of their longer-term demise. Of course, the 'efficiency' illusion they labour under gives those of us involved in the organization of conditions for enlightenment a little more time.

School practitioners, curriculum theorists and developers through analyses implicated and sponsored by practical method, and by critical cross-cultural anthropologies must decide for themselves that self-formation and societal reformation are tied firmly together in linguistic, cultural, and structural bundles. Subjectivity carefully mediated by a pedagogy of linguistic-discursive communication in school situations that allows a progression of intersubjective encounters can lead to personal autonomy and collective consciousness necessary for using culture as a motive or reconstructive force in classroom relations, curriculum projects, and social action. Teachers, and academics who have become politically vulnerable through the risks they may have taken as political persons can capitalize on the structural understandings that their marginalism has given to

them. These experiences of struggle and victimization can become part of a shared intimacy and solidarity with others in teaching, in research, and on other social or occupational fronts. The more these experiences and the possibilities of their classroom work in critical practical pedagogy are symbolized in public discourse, the more this work contributes to a multi-dimensional reflexivity in persons, in collectivities, and in regions of the country. This process, in turn, links back to socialization and secondary socialization as it lays the practical groundwork for discursive self-formation and autonomy.

A final word, in the way of a warning, on the appearance-essence distinction in curriculum reform is necessary in the completion of this discursus. Marcuse sums up the problem in his expression, "repressive tolerance". The history of curriculum innovations and implementation is replete with the pseudo-responsivity of state agencies and school districts which appear to incorporate program design changes at the behest of progressive interest groups. Later conceptual analyses of the shifts in pedagogy or curriculum policy consistently show that the latent core of strategic meanings has been left untouched; that the pedagogy, curriculum content and evaluation modes reflect relations of dependency with teaching-learning, with character formation and acts of knowing, and with civic outcomes of future social competence in students. Radicalized curriculum theory and development needs to attend to the surfeit of "bad

faith" that state agency responses and decisions are saturated with. Curriculum reform, as a programmatic politicization of this decisionistic response structure carries this "bad faith" into classrooms, professional development, and the organization of research. "Bad faith" is a cynical debasement of human dignity and responsibility which shows up in formally accountable activity in institutional life in areas such as 'credentialling', 'individualization', and 'interests' in schools, in multi-cultural expression, and civic participation at the level of cultural forms, and in the political-economic structural dependencies of regional life. Each of these levels of social practice, in their appearance and essence, refract through one another with reproductive implications. Each burrows into the future of the other in the pursuit of happiness and progress. It is only in knowing the intimate and the particular that we can reconstruct their meanings for ourselves as an ongoing discourse of political education. Practical method intersects with the individual in:

1. Teacher education and school pedagogy that needs to develop protocols of communication that practice discursive forms of teaching and learning, dialogical group formats, and a practical recognition of idealized speech norms in most lessons.
2. The development of critical-practical thinking, exercises in autobiographic reflection, and mutual consciousness-raising of conceptual and historical issues that need to be an explicit part of teachers' program plans.

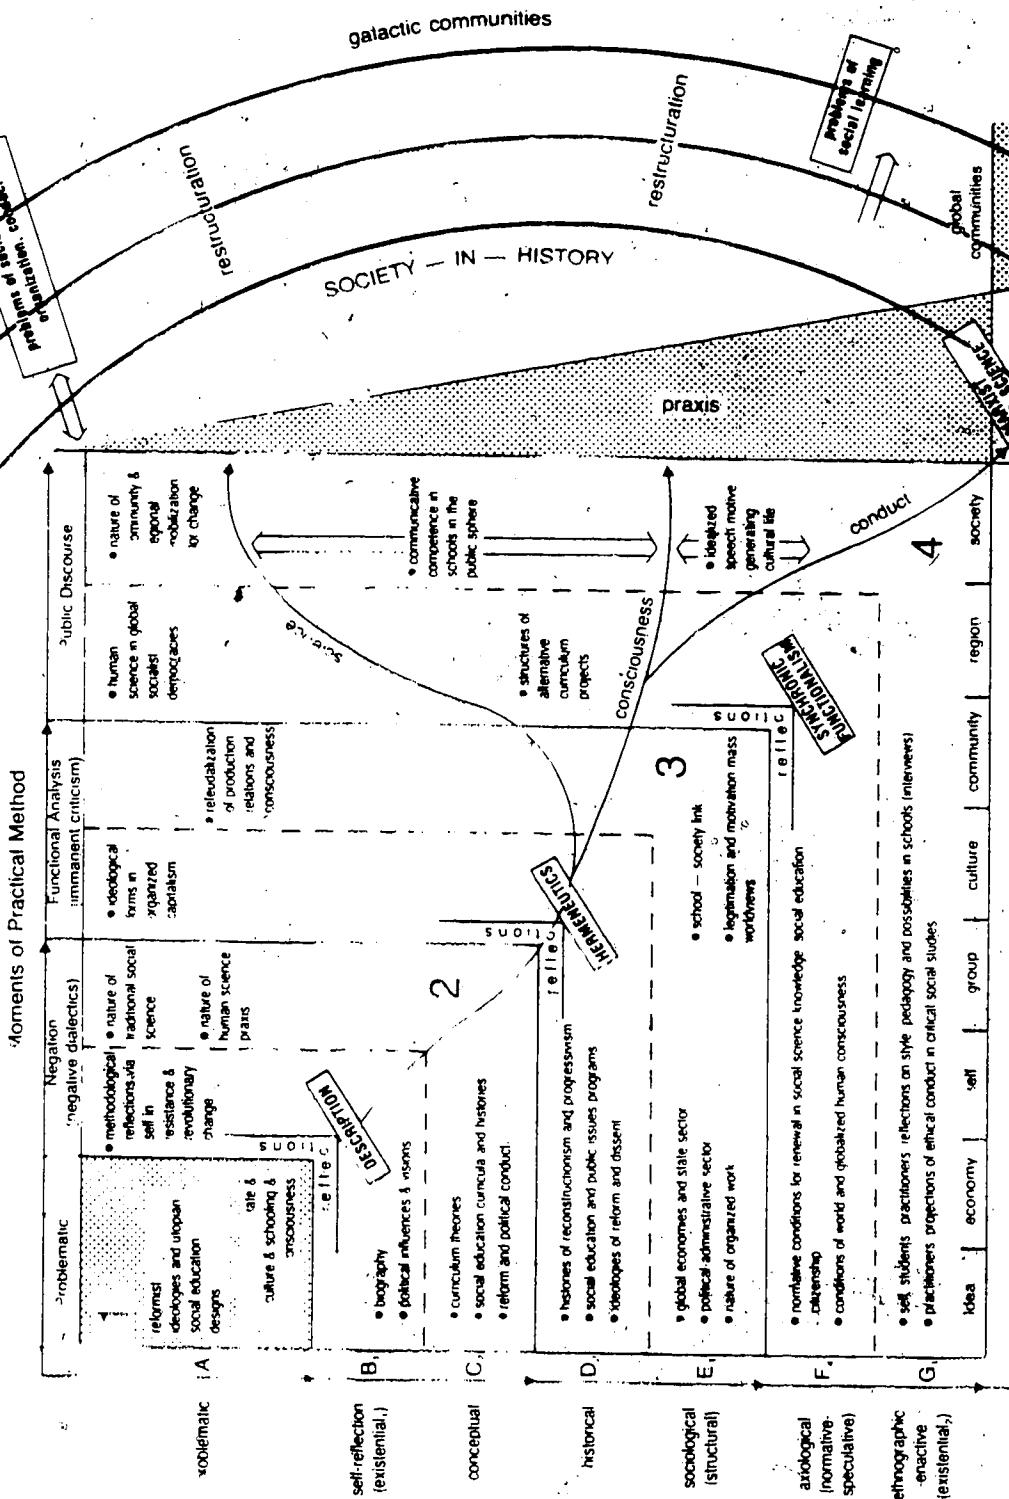

- ning in not only social studies education.
3. Attention to speech and cultural particularities as aspects of personal integrity that should be stressed in classroom relations and in the growth of a communicative ethic in which students and teacher participate.
 4. The formative links of character, biographical contents, community and regional cultures that need to be stressed as students' social experience spirals and expands, with informal discussion and through formal content.
 5. The necessity of teachers to avoid psychologistic language or vocabulary in identifying students' performances to themselves and to their colleagues; and the effort to work out more adequate relational expressions that convey the latency of caring, knowing, helping, and acting are underscored as strategies of persons.
 6. Shifting the bases of the reward structure of school socialization from false conflict (competition) and privatized, zero-sum points or prestige to personal competence or efficacy and collective 'betterment' is important. In later school years, (beyond infancy) this could include the experiences of planning and implementing of social projects, by students, in the community and the region that arise from a study of social problems.

The real individuals of our time are the martyrs who have gone through infernos of suffering and degradation in their resistance to conquest and oppression, not the inflated personalities of popular culture, the conventional dignitaries. These, unsung

heroes consciously exposed their existence as individuals to the terroristic annihilation that others undergo unconsciously through the social process. The anonymous martyrs of the concentration camps are the symbols of the humanity that is striving to be born. The task of philosophy is to translate what they have done into language that will be heard, even though their finite voices have been silenced by tyranny.

APPENDIX I

A Typology of Knowledge Codes

J.E.M. Cohn, An Investigation of Curricular Innovation and Educational Knowledge Codes in a North American University. M.Ed. University of Alberta, 1975.

Dawe's distinction between sociological understandings founded on the priority of society as the necessary means of establishing order in the anarchical relations of men, and sociological understandings founded on the need for most men to regain control of the institutions of society; was used to critically examine Bernstein's theory of educational knowledge codes.

As a result of this examination it was suggested that Bernstein's two educational knowledge codes belonged to Dawe's first category of sociological understanding, and that a third code was necessary to take into account Dawe's second category of sociological understanding. This code was developed theoretically and termed the Emancipatory Code.

Using these three codes an empirical situation in a large Western Canadian university was examined, where a professor wished to introduce an innovatory curriculum programme in a junior level education course, through the "good offices" of three instructors under his supervision.

As a result of this examination it was discovered that, although the professor's initial perceptions of the innovatory curriculum programs could be considered as within an Emancipatory Code, the instructors taught the course as an Integrated Code form. Various reasons as to why this occurred were put forward, and this led to a consideration of the problems and difficulties involved in educational knowledge code in a North American, course-based, university situation.

The Problem

The sociology of education, like sociology itself, can be seen to be in a state of paradigmatic crisis. Whether this crisis should be viewed as the destruction of a previous paradigmatic position, and its subsequent transformation, together with new insights, into a new paradigmatic position;¹ whether it should be viewed as the growing pains of a new academic discipline in a primitive stage of growth, taking its first steps from a monolithic mechanical to a differentiated organic solidarity;² or whether it should be viewed as the development of conflicting and pluralistic perspectives essential to the healthy development of a social science discipline;³ it is far too early to say. However, whatever the eventual outcome, it is quite apparent that Olive Banks' assertion that sociology of education works within a structural-functional paradigm,⁴

with its main concern as the doctrine of "order",⁵ made in the late 1960's, is no longer viable. It is now possible to recognize, in Britain for example, three conflicting theoretical positions: the continuing structural-functionalist one, the phenomenological position, concentrating on social interaction at a micro level, utilising ideas from people such as Schutz, Merleau Ponty, Marx and Mead; and the new structuralists utilising ideas from people such as Althusser and Luscher.⁶

Nevertheless it is very likely that sociologists of education representing all three positions would today accept that educational knowledge and educational realities are, at least to some extent, socially constructed; and so can be treated as problematic. This represents a major shift in perspective which allows sociologists of education to "make" or define their own problems, rather than merely "take" or accept as unproblematic problems defined by other educators.⁷

One of the major influences in undermining the position of the structural functional paradigm in British sociology of education was the collection of articles edited by M.F.D. Young under the title Knowledge and Control.⁸ While they cover a broad range of subject matter and perspectives Young has argued that:

What they all hold in common is that they do not take for granted existing definitions of educational reality, and therefore do "make" rather than "take" problems for the sociology of education.⁹

The impact of the book has been such that one writer has described it as representing "a fundamental change within the sociology of education which I shall describe as the emergence of an alternative paradigm".¹⁰

By treating educational realities as socially constructed and problematic one can raise questions about the curriculum making process which have traditionally been ignored by curriculum developers using a linear model of curriculum development. It now becomes necessary to give due consideration to institutional constraints, the "personal biographical situations"¹¹ of both curriculum implementers (teachers) and curriculum receivers (learners), and the pragmatics of the classroom situation, which make the transmission of educational knowledge problematic.

The Area and Significance of the Study

This study had three main purposes: Firstly, to clarify and adapt Bernstein's theoretical formulation of educational realities in the terms of two educational knowledge codes, one descriptive of current educational situations, the other predictive of future educational situations. Secondly, to formulate a third educational knowledge code in contradistinction to Bernstein's predictive code, as an alternative future educational reality. Thirdly, to use these three educational knowledge codes as the basic structures, within which to empirically examine an innovative curriculum project, being attempted in the Educational Foundations Department of a large Western Canadian University, during a one semester junior level education course. The emphasis in this study will be on utilising these theoretical frameworks to interpret the empirical reality; although, of course, the validity of the theoretical formulations will, to some extent, be questioned through their capacity to explain and provide understanding of the empirical reality.

In utilising Bernstein's educational knowledge codes it was found necessary to clarify and adapt, to some extent, his original formulations; because, as Daine remarks:

Many of these concepts ("collection", "code" or "frame strength", "deep structure", to name a few) are both theoretically and empirically obscure. 12

This I found particularly troublesome with respect to his predictive or Integrated Code teacher-based form; but have succeeded, I hope, while reformulating this code, in retaining the spirit and intention of his work, if not its precise theoretical detail.

This study, then, attempted to expand the area of predictive educational realities presented by Bernstein theoretically, and examine an innovative curriculum project in terms of these theoretical formulations.

APPENDIX. IV

Ideal Type of Methodology

Methodological Note on Ideal Type Analysis

A question posed in a preceding section of this study is exemplary of the grounds for my critical-practical inquiry into social reformist curriculum positions that have appeared throughout this study. It is paraphrased once again:

"Are the well-intentioned value preferences of social educators (ie. D. Oliver (1976), F.N. Newmann (1975) as illustrated through their pedagogical and curricular procedures structurally inadequate as means to achieve the social, political and ends to which their programs formally aspire?"

Secondarily, I ask whether the image of a reconstructionist or critical educational model sketched by these social educators is congruent with the logical criteria that we can expect to be integral to a critically-reflective social science (in this case one can read this as integral to a critical social studies)?

In order to tackle the primary question, and its corollary, I need to take stock of not only our conceptual tools of analysis but also to propose a methodological format that can frame these conceptually inquiries in as theoretically and historically comprehensive a manner as possible. Conceptual elements from the tradition of critical social science will attempt to satisfy the first need while ideal-type methodology will seek to remedy the second need so that our analysis may proceed. Elements from that scientific tradition will be taken to be juxtaposed with the ideal type format.

Max Weber could be said to be the first systematic exponent of social action theory and the methodology associated with - ideal type analysis; that is, the method of comparative analysis integral to the sciences of human action. Weber had drawn from mid-19th century that neo-Kantian and neo-idealist traditions in Germany, represented respectively by Heinrich Rickert and Wilhelm Dilthey and the Historical School in his attempt at a synthetic, systematic social science. He drew, in particular from Dilthey's distinction between the material and the cultural sciences. The latter had made the claim that each form of inquiry has a distinct method. Whereas the natural sciences engage in

facts, per se, the cultural sciences engage in meanings. Systematic thought in the natural sciences assumes the form of explanation while in the cultural sciences it assumes the form of understanding. The methodology of explanation of the natural sciences is, par excellence, the standardized experiment while within the cultural sciences the methodology of understanding is constituted by interpretation through ideal types.

Weber drew from Rickert the point of view that science is constituted by the explanation of physical or social world phenomenon. Rickert to some degree collapses the distinctions Dilthey argues for in reducing natural science and social science to science in general. The salient distinction introduced here is between history and science. As science is to be seen as the apprehension of the natural world in terms of causal laws so history is the apprehension of the natural world in terms of causal laws so history is the apprehension of the natural world as a pattern of unique events. Since the key concepts of science were to be laws the key concepts of history were to be particular configuration of value.

In attempting to develop critical standards for a comparative method for the study of social action Weber was obliged to examine the nature of the relationship between science and history. Weber in effect borrows and synthesizes from these traditional traditions with the outcome that his theory and method of social action dealt with meanings values and causal laws as its legitimate subject matter. By viewing social science as a scientific tradition, with particular stipulations as to its subject matter, Weber advocates the use of 'typological procedure' as a primary methodology. In order for comparison of the social world to be conducted the 'ideal type' emerged as a solution.

It was from these beginnings that Weber attempted to construe a methodology of the social sciences. He felt compelled to distinguish yet reconcile the two types of science natural and cultural, but so as to allow a treatment of social-historical materials in a systematic scientific manner rather than as an art. In order to address the latter need Weber felt a methodological emphasis was necessary that demonstrated causal relationships, in the social world, but which were grounded in some logical schema of proof as was the process of 'explanation' in the reconstructed logic of inquiry of natural science. Weber conceived his methodological problem to be to define the kinds of generalized categories which met the logical requirements of this schema and at the same time embodied the point of view peculiar to the historical-cultural sciences. From this perspective subjective categories of social action were developed which would permit

understanding and comparative analysis of the social world. Weber employed three generalized concepts that logically and empirically implied the presence of the other. The concept of social action (4 types) led logically to the concept of social relationships (or institutions) which led to the concept of the general system (or articulated whole). This latter concept was more implicit and buried in the conceptual schema than the other two. Although each level could be studied independently the significance of this for our interest is that each concept was considered to be invested with the subjective meaning of actors also engaged in the different structural levels of the social world. One was to apprehend this world first and foremost through the meaning and significance actors, singly and collectively, imputed to their activity and constructions and others activity and constructions. Admittedly, the three levels or types of concepts formulated subsumed a wide range of type concepts corresponding to that segment of the world. Neither class of concept nor the portrayal of typical actors' measuring that emanated from their activity are fully exhaustive or reflective of concrete reality but particular conceptualizations that are abstract by nature.

What essentially gives form and substance to concepts at each level is subjective meaning. Weber construed meaning to be composed of two kinds: that actually which was empirically imputed to a concrete individual actor, and that which was a theoretically-conceived pure type of subjective meaning. For our purposes the pure type can be taken to be parallel with the notion of ideal type. For Weber's purposes the pure or ideal type meaning is the first and most obvious level of generalized abstract concept and as a construction, of course, met the logical requirements of the proof schema and were closest to the texture of concrete individual reality.

Twenty years later Alfred Schutz picks up the implications of Weber's methodological work and embarks on a massive project intended to 'correct' and develop some of the conceived weaknesses in the latter's efforts. Schutz, likewise tackles the problem of how to do social study or equally the criticism of social study. He argues that four postulates must be recognized and integrated within the investigator's methodological design for the social world. In much condensed form they amount to the postulate of relevance, the postulate of subjective interpretation, the postulate of adequacy (or objective possibility) and the final and most important, the postulate of rationality. The prior three postulates are collapsed into the fourth which implies (and gives sense to the other three) that all behaviour is to be interpreted as derivative from basic scheme of rational acting. It is only action within the framework of rational categories that can be discussed scientifically. (Although, the nuances of

Schutz' updating of Weber's framework need not concern us here (it is to the multiple level concepts of social action that Schutz makes reference).

Hence, it is within the theoretic practice of the historical cultural sciences that the salient feature becomes the interpretation of the social world in terms of a system of determinate logical structure. Therefore in any investigation of social practice or cultural production, Schutz suggests, we are dealing with a conceptual system of means-ends relationships, one that is abstracted from the world of concrete actions.

A normative orientation is integral to 'action' frame of reference of Weber's methodology. Within this the actor is seen as actually making an 'effort' to conform with certain 'ideal', as opposed to actual, conduct patterns in which there is contained the probability of partially successful efforts and some degree of deviation from the ideal state. The nature of the ideal (type) implied here is that of a particular kind of abstraction in which is posited the normatively ideal pattern or configuration; implicit in analysis of this kind is the degree to which conduct or cultural production complies with the norm. It may be such a hypothesis provides the regulative principles for generating the particular system of ideal types. For instance, classical economics embraces the utilitarian principle while modern economics embraces the marginality principle. For sociology, according to this conception, sociology embraces the principle of rationality. Hence, the historical-cultural sciences are not seen to be alone in their use of ideal types as methodological-theoretic devices but virtually all of scientific practice employs this notion albeit in an implicit, non-systematic manner.

Schutz speaks directly to use of ideal types by reference to economics:

"Build your ideal types as if all actors had oriented their life plan and, therefore their activities to the chief end of realizing the greatest utility with the minimum of costs; human activity oriented in this way (and only this kind) is the subject matter of your science."

(Schutz, 1964, p. 87)

For our own quest, in this study, I have taken ideal typical analysis to be documentary interpretive analysis. Further on in this appendix I will establish a critical social studies model as the constitution of an ideal typical cultural production.

Let us examine somewhat further what features the generic notion of ideal type may possess. As we have said Weber conceived of the ideal type as both abstract and general yet not descriptive of a concrete course of action, but a normatively ideal course. This view of social action assumes certain ends and normative orientation modes as 'binding on the actors'. It follows that the type is descriptive not of an individual action course but a typical one; that is, a generalized rubric within which an indefinite number of cases may be classified. In other words one could say it represents an "objectively possible" course of action. (A notion that Alfred Schutz retrieves.) It should be noted that an ideal type contains no particular statements of fact but involves logically fixed relations between the values of various variable elements involved in the depiction of individual conduct, institutional life or historical tendencies of the wider social structure.

In the social sciences, it may be said that empirical generalizations emerge as a set of typical probabilities associated with a typically observable course of action and grounded in the assumption of an ideal means-end orientation, the ideal theoretic type may also for motives of "methodological convenience ... be heuristically employed." (Weber, 1974, p. 92). Theoretic-type generalizations then should not be taken as typical empirical generalizations but as structural forms predicting a set course of events under certain social and historical conditions.

Gerth and Mills (1946) in their interpretation of Weberian methodology have understood the ideal type not as "a new conceptual tool" but simply a procedure to make cognizant for 'consociates' the processes and relationships involved in using terms such as 'feudalism', 'economic man', 'capitalism', 'democracy'.

"Social scientists (had the choice) either to use logically controlled, unambiguous conceptions, removed from historical reality or of using less precise concepts closer geared to the empirical world."

(Gerth and Mills, 1945, p. 59)

They refer to Weber's interest in the world comparison of economic systems and religious orthodoxies. They point out that he relied on the structuring of 'pure', polar cases at either end of a range of features exhibited by the actual, historical situation. One example, is the degree to which world religions manifest "senseless suffering" as a formal feature. The different religious cases are then arranged on this typological scale of 'extreme' and 'pure'.

Capitalism, for instance, has according to this procedure, a number of componential features. One such feature is the provision of overviews for profit-opportunities. Although the types and sub-types vary in scope one is able to distribute empirical cases along a scale or continuum for comparative analysis yet at the same time develop a general theoretic conception of capitalism. Such a methodological procedure represents a controlled level of abstraction in which the 'crucial instances' contained within the ideal types permit the historical analysis of a particular problem.

In the third section, of the larger study I have been concerned with a comparative criterial documentary analysis through the construction of an ideal type. The function of the latter is very much contingent on the particular research interest-at-hand. The construction of the ideal type is to be logically distinct from the application of the type as an interpretive schema. The methodological task then, in the sense of this appendix, is the interpretive grasping of the meaning intended to be associated with the rationally formulated pure type of a common phenomena and involves the interpretation of cases of future action or production via an ideal type.

The task, then, that has been set for this appendix in terms of the preceding discussion is as follows. A construct will be identified as a critical social studies model in an ideal typical sense. Its component elements whether epistemological, pedagogical, curricular will be identified as will the logical relations between them and the boundary conditions of their variation specified. These elements will be conceptually integrated within the model-viewed-as-an-institutional set of relationships, historically and economically situated. As these elements will be specific ideal typical dimensions of the general critical social studies typology actual case examples of relevant facets of empirically, existing programs may be seated as to degree of consequence, Newmann, (1975) and Oliver (1976). They will be critically interpreted and compared as to intended objective meaning for school practice and in terms of their implications for educational practice as would be predicted by the general critical typology. It should be noted that whereas an earlier reference was made to the essentially non-evaluative significance of ideal type use the critical or social studies typology is equally non-evaluative in its analysis with respect to the singular moral nature of the concrete programs (Newmann and Oliver) but is critical or critically-reflective about the educational efficacy and operative assumptions of these particular rational constructions (termed programs) intended for 'reconstructionist' ends. Hence any evaluative discussion that pertains to

assume the form of such judgmental monological language is not intended to be equivalent in scope or function to the disembodied, ahistorical ethical 'reasoning' found masquerading in the realms of the analytic philosophies and their pedagogical simplifications, as legitimate and reasoned discourse. As our review of the tradition of critical science should demonstrate ethical discourse is logically inseparable from theoretical practice as each conceptual (or curricular) representation is also, among its other properties, a theory of society (or social relations grounded in definite species-given 'interests' of domination, understanding and control. Perhaps the above distinction of evaluation can be clarified if we view ideal types such as the ones pre-occupying Weber ("Protestantism," "Christianity", "Capitalism") or the one of central interest for this essay, critical social studies, are not to be identified as stereotypes of historical phenomena, which can lead to narrow, reductionistic evaluative concepts but instead as devices leading to open analysis, deliberately framed by the investigator's selection of empirical and theoretic knowledge at the time.

According to an aforementioned postulate of 'adequacy' the variable elements of the critical social studies typology are not to be seen as imaginary notions and practices regarding social reconstruction. These factors are to be taken as "objectively possible" and plausibly operational under certain historical and political conditions. One intent of the typology is to 'point up' certain patterns of relationship implied in Harvard school program proposals (1975 and 1976) which would have a particular causal effect on the directions school practice takes. Hence we can compare and weigh through the typology the causal significance of selected items and assess their expedience for reconstructionist outcomes. That is, if we wished to assess, say, the significance of the instructional component of legal-political process management in the citizen-action curriculum (Newmann), we could strive to determine its necessity or non-necessity for contributing to environmental competence and to what extent environmental competence, as a form of critical citizenship education, was illustrative of a critical social studies. Clearly, innumerable examples of analytic projects of this sort could be given here. It should also provide an idea of the patent massiveness of any comprehensive critical interpretive analysis.

I contend that the following necessary functions of ideal type analysis can be applied in this kind of inquiry and study:

- 1) To determine to what degree the Newmann and/or Oliver programs of educational reconstruction are either partially or totally, as

historical-cultural phenomena, approximate the theoretically constructed ideal type. This analysis will be instrumental for displaying, explicitly, some of the arrangements between variables in each program and 'pointing up' the clarity of offascating properties of language used in these separate projects.

- b) To attempt the systematization and cultural symbolic location of varied subject matter - as dispersed in the two widely different program formats - by the use of the general ideal type of critical social studies. This task puts the analyst in the position of focusing on the "internally most consistent forms of practical conduct that can be deduced from (the programs') fixed and given presuppositions" for its implications for student and citizen behaviour. (Weber, 1946, p. 324)

The significance of this statement is given in the Marxian notion of the interpenetration of ideas with material interests.

- c) As a corollary to 'b)' such an analysis that throws into relief the actual course of program events (of Oliver and Newmann) against the ideal type actually enhances the development of central explanatory hypotheses surrounding the not-educational motives of the two Harvard proponents.

For a comprehensive exposition of the methodological nature, background and use of the ideal type in social science and educational research see A. Kaplan, *The Conduct of Inquiry*, 1964, 82-83; R. Merton, *Social Theory and Social Structure*, 1949, 221-225; M. Weber, *The Methodology of the Social Sciences*, 1949, 42-47; A. Schutz, *The Phenomenology of the Social World*, 1972, 237-238; P. Filmer et al., *New Directions in Sociological Theory*, 1972, 88, 191, 225.

FOOTNOTES

1. May it be noted by the reader that the term ideal refers to a perceived state of affairs from the actor's point of view rather than from that of the investigator.

APPENDIX V

EDUCATIONAL FOUNDATIONS DIVISION

SCHOOL & SOCIETY

EDUC 5067
M-F 8-9:15
E. Burt
Summer 1982

The course involves students in a theoretic, reflective, and practical inquiry of interrelations between social structure, community, school and curriculum decisions. The course deals with the central question of how society is possible, of how our consciousness of society is possible, and of the school's role in reproducing such competencies and understandings in students living in communities. As such we will be concerned with investigating processes of socialization, legitimation, social selection and opportunity, and environmental competence.

The course proceeds by way of a descriptive analysis of significant ideological and economic trends in societal and school structures in North America and the United Kingdom. This is followed by interpretive readings and study of classroom and curricular data as one basis for portraying the relations of community and the wider society. Students are encouraged to opt for and declare a preferred pedagogical and sociological stance regarding the role of the school in reproducing student's identities and community life. Developing some practical competence with methods of analysis, reflection and intervention, comprise the third part of the course. Here, students should seek to demonstrate a practical understanding of the links between identity - school community - society through a field study that begins to anchor and illustrate their own evolving sense of professional responsibility for their own and other's social futures.

Part 1 (the social 'IS)	Part 2 (ought)	Part 3 (ought to be done)
<ul style="list-style-type: none"> - international economic trends - models of schooling - models of social reproduction - variants of educational ideologies - components of the community 	<ul style="list-style-type: none"> - interpretations of school, classroom & societal data - consciousness & its contents - preferred & declared world views of schooling 	<ul style="list-style-type: none"> - practical inquiry - asking questions & getting answers - linking school, curricula & community - developing awareness of structures - developing & acting with pedagogical awareness

- 2 -

As the course is organized on a seminar-lecture basis students are advised that an active contribution to discussion and activities in class is expected. The development of skills and imagination in practical inquiry is a dimension of the course towards which students should work and gain competence - a final expression of which is the doing of a field study. (investigating school-community links).

ASSIGNMENTS AND EVALUATION

40% Mid-Term Take-Home Examination DUE JULY 26

(i.e. theory & method of social inquiry in education based on course texts, assigned readings & discussions).

60% Field Study or Research Essay DUE AUGUST 16

(particular emphasis should be placed on demonstrating the rudiments of practical or critical inquiry for teaching via a community-oriented study or research essay).
see Berlak & Berlak 6, 10, 11.

Readings

The Rise of the Meritocracy. Michael Young. Penguin. Harmondsworth. 1961.

Dilemmas of Schooling (Teaching and Social Change). Ann & Harold Berlak. Methuen. New York. 1981.

assorted handouts

...And must not an animal be a lover of learning who determines what is or is not friendly to him by the test of knowledge and ignorance?

Most assuredly.

And is not the love of learning the love of wisdom, which is philosophy?

They are the same, he replied.

And may we not say confidently of man also, that he who is likely to be gentle to his friends and acquaintances, must by nature be a lover of wisdom and knowledge?

That we may safely affirm.

Then he who is to be a really good and noble guardian of the State will require to unite in himself philosophy and spirit and swiftness and strength?

Undoubtedly.

Then we have found the desired natures; and now that we have found them, how are they to be reared and educated?

The Republic

EDUCATIONAL FOUNDATIONS DIVISION
UNIVERSITY OF NEW BRUNSWICK

BASIC CONCEPTS IN EDUCATION

EDUC 3004

Historical, Philosophical and

E.C. BURT

Sociological Critique

M.W.F. - 14.30

The course is concerned with introducing and developing within students the conceptual and practical competencies of social and philosophical criticism. The course examines through critical modes basic and enduring problems of schooling, educational theory and practice in both Anglo-American and global or world contexts.

The course sees such problems as economy and schooling, management of knowledge and cultural transmission through curricula, classroom social structure, biography and self-reflection as determinants of school achievement and provision. Perspectives and traditions from history, sociology and philosophy provide the framework for guiding students' critical inquiry into these problems.

Students are expected to develop for themselves a systematic method of inquiry that allows them to dissect, describe and evaluate educational realities of self, classroom, school and social life that they have encountered or studied in their teacher training programs. To that end the course relies upon concepts basic to the disciplines of existential-phenomenology, critical and interpretive sociology and historical method that will enable the student to acquire a defensible pedagogical method of criticism in his/her examination of educational problems. Through the uses of criticism students will develop a personal, normative position with regard to the organization of teaching and schools. This suggests that by working through such a project students will be in a position to act reflectively with compassion and rational judgment toward problems they confront in everyday life as teachers and as citizens.

The course, then, proceeds along two parallel lines of inquiry. Early in the term students will internalize the elements of a working method of inquiry. This method will be practised and refined as we encounter problems cast up by the social sciences and philosophy. The second kind of inquiry, then, is a particular excursion into the terrain of existential-phenomenology, interpretive sociology, and history. Both these lines of inquiry continue throughout the course allowing students to critically examine and act upon issues in education cast up by history, philosophy, and sociology.

The course runs on the basis of lectures, seminar-format, presentations and readings. We will have speakers and resources from the outside to deepen some of our inquiry. Participation by all class members is a prerequisite to a successful course.

In every society...there are some persons with an unusual sensitivity to the sacred, an uncommon reflectiveness about the nature of the universe and the rules which govern their society. There is in every society a minority of persons who, more than the ordinary run of their fellow men, are inquiring, and desirous of being in frequent communion with symbols which are more general than the immediate concrete situations of everyday life and remote in their reference in both time and space. In this minority, there is a need to externalize this quest in oral and written discourse, in poetic or plastic expression, in historical reminiscence or writing, in ritual performance and acts of worship. This interior need to penetrate beyond the screen of immediate concrete experience marks the existence of the intellectuals in every society.

(Edward Shils, 1958)

Evaluation:

- 40% 1. Participation throughout the term .
 2. Mid-term take-home or essay exam. February 19.
- 60% 3. End of term essay or term paper. April 21.
 (format for term paper writing will follow)

CURRICULUM STUDIES
PERSPECTIVES ON HUMAN PRACTICE

EDCI 6104
Curriculum and Instruction Division

E.C. BURT
Tues. 5:00-8:00

STRUCTURE: A REVIEW

This course is structured to provide students, teachers, and administrators interested in program development-evaluation with opportunities for systematic inquiry into the range, depth, and function of curriculum literature, policy issues and alternative developments in curriculum theory. Course members will be exposed to and will practice through concrete precedents the tasks of curriculum development and evaluation work. It is important that members develop a vital historical sense of the emergence of the curriculum as a field of study. Furthermore, its latent possibilities as an inquiry community for educational and social reform will be stressed.

The course takes seriously the re-introduction of the idea of human practice as an organizing concept for both theoretical inquiry and for practical political conduct. Human practice as an idea can be taken as the notion that the heritage of our cultural, economic, and educational institutions is understood as the accumulated history of culturally-specific relations between fellow persons crystallized in memory over time. Persons are seen as acting towards, negotiating with, and opposing one another in a network of power, sentiment, and possibility. Ideas such as the school, knowledge, curriculum, evaluation, policy development, and so on can be accounted for collectively and situationally by the intentional consciousness of persons acting toward one another, grasping jointly-produced meanings, constrained by and transcending the weight of their respective horizons of tradition. Each of us, in setting, pursues his or her particular life project. Human practice or reflective practical conduct does not suggest that the social world is a more additive outcome of situational life or that it can be reduced to the intentional graspings of a few individuals but that all forms of knowing, acting, apprehending, sense-making and valuing that we do as teachers and as citizens are made possible and only constituted by the moral and political activities of classes and groups of men and women acting in concert or in fragments towards some notion of the good and realizable life. Of course, in different societies and different niches of a culture we can expect persons to hold to a different idea of their project. This diversity in interests and projects we know only too well from the conflicts within the educational community and the curriculum field in particular.

The idea of human practice understands 'human-ness' in both its particular and essential or universal qualities. What we find as universal interests are the material struggles for improvement and mastery of life conditions, the interests in understanding, and that of autonomy. These struggles or life pursuits, however formal or institutionalized they might be, are never detached from their grounds in our everyday world of needs, interests and concerns as intimate persons.

CURRICULUM STUDIES

PAGE 2

With this view we find that the living contours and experience of human practice, as world-building, connects the apparently sacred and profane realms of theory and practice. What's more these living contours are through and through moral and political relations. The argument, however, suggests that it is not only futile to separate these kinds of practices conceptually or in conduct, but that it is historically distorting of the development of global traditions of science in the West and East. Furthermore, to suggest, as does the narrow technical conception, that theory speaks not, is not mediated by, nor grounded by practical moral conduct, is an ideological misrepresentation -- a stance, incidentally, the history of modern educational thought has all too uncritically practised. So, with other kinds of workers persons in the curriculum field are urged to reconsider their work as:

"a form of utopianism, a form of political and social philosophizing and theorising. If we recognize this, it may help us sort out our own thinking and perhaps increase our ability to communicate with one another." (MacDonald, 1975)

The course has proceeded, as you have discovered, and will continue along two parallel lines of inquiry. We look, along one of these lines, at more conventional ordinary language themes in curriculum development, evaluation, and theory. Discussions, readings, and presentations have reinforced this. Our second parallel engages in a more philosophical inquiry into the bases of human action, decision, and responsibility. This line commits us, as course members, to become self-reflective as teachers and citizens concerned with our own biographies, interests, and relations with others as these impinge on our work as curriculum people. The two lines of parallel inquiry are essentially mediated and drawn together by examining specific problems and selected issues in the field of curriculum studies. Resource persons, article handouts, and film are some of the means we have of connecting ourselves, as intimate persons, to the structure of the world we live in. At the same time, we reconnect two lines of questioning that are the axes of a human science. All of these activities, as three separate but interrelated tasks, are called for in a reconceptualized curriculum inquiry.

Even as program developers and evaluators we increase the possibilities of a community of practical-dialogue if we recognize the grounds of our social practices.

To this end we rely in the course on a range of teaching and learning strategies, resources, and instrumental content that each of us, as course members, will adopt from time to time in achieving the course objectives. I would expect that students, at times, will feel the discomfort of ambiguity as their traditional roles are deepened and reconsidered.

Is it because we are afraid to acknowledge that power makes up our center -- a power that necessarily comes up against the power of others; principals, parents, kids, board members, text writers. We are afraid, maybe even ashamed, to acknowledge that that which we are about as educators is politics: a struggle

to maintain, maybe even change through destruction and reconstruction, the world we make with others. If we acknowledge that we are political we necessarily risk defeat, or maybe the awareness that we are indeed doing someone else's thing and are alienated from ourselves. If we acknowledge that we are political we risk recognizing our importance and hearing ourselves as braying asses or clanking symbols. It is far easier or safer to proclaim the individual and to then fit ourselves into a prepared slot: buy someone else's package of objectives, materials, and bets; or put on someone else's alternative school. Then if we fail, it is their fault, not ours.

Innovations in Secondary Social Studies Curriculum

Ed. C.I. 462-463
Department of Secondary Education

E.C. Burt
N1-107
Thursday 9:30-12:20

Structure:

These courses are structured to provide a deep historical understanding of recent and past developments in secondary social education. The accent throughout both courses is on a collaborative form of teaching and learning.

In the initial term students are involved in a review of selected social studies strands such as reconstructionism, community education, reflective-inquiry, disciplined-centred forms, and current designs of provincial social studies curricula. In parallel and concurrent with the historical review we actively explore the bases and possibility of a critical social studies form. Such an activity relies upon students providing personal knowledge and expression from their lifeworlds at the same time as we tap conceptual precedents, formal social studies projects and empirical knowledge of our society in order to synthesize a critical standard or 'ideal type' of citizenship education. Throughout this course we consciously attempt to 'situate' our 'C & I' and social studies languaging, our activities and our conclusions in an explicit social and historical setting.

The use of a 'critical type' enables the class, as participants in a collaborative way, to analytically question and probe the historical and pedagogical nature of their selected social studies traditions. Students are enabled to ask questions regarding the 'worthwhileness' of each tradition, its scope and effect as a set of educational practices (for secondary students), and its impact upon political and cultural relations in an intended community. Students will engage, in the first term, in gaining an analytic and historical knowledge of selected social studies traditions, a clarification and elaboration of their particular commitments to a social studies curriculum orientation, and the development of a (defensible) set of norms for practical conduct as a teacher and citizen in the world.

Course members will be concerned with developing skills in historical and conceptual analysis, modes of researching, and an ability to practice deliberative argument and persuasion. The critical social studies form,

- 2 -

generated by the class, acts as an historical reminder of the evolution of consciousness within our collective lives as teachers and learners. The critical form can act to remind us of our commitments as educators to the practice of responsibility and autonomy in our life and school communities. As well, it seeks to validate itself through a reflective scrutiny of our conceptual and practical activities as social studies teachers.

In the second term (463) the course typically 'invites' students to become adept at translating their preferred conceptions of the social studies into practice. This can involve taking the languages, practices and assumptions of their theorizing and analysis and making these an integral part of curriculum units, resource units, simulations and in-school observations/evaluations. It is important that students do not lose practical sight of the importance of incorporating their conceptualizations from the first term within the resources they develop in the second term. (Parts of these units will be micro-taught to the class.) Criteria of success in this respect rest with whether the remaining class members are 'moved' and can respond deliberately and reflectively, as students, to the intended instructional outcomes. In other words can we discern changes in self-consciousness and conduct even amongst our own class members?

Students will strive to secure a pedagogical and practical correspondence with the traditions they debated, elaborated and justified throughout the first term's work. Practice teaching in social studies within the seminar sessions or within school classrooms is not to be taken as an afterthought but should be seen as one important means of validating their image of good social studies practice.

During the second term's work students continually recollect their indebtedness to the essential mediations with the notion of critical inquiry. The success of their projects relates to the success of their remembering. It is an obligation of this course that participants demonstrate or redeem their view of the good citizen through the preferred curriculum decisions and instructional strategies they choose when practising social studies. In this sense the class participants, as teachers, become committed to a notion of what is worthwhile striving for in their teaching, the content they may

transmit, and the view of the good life they hold for their students - as mediated through a particular social education perspective.

As for the career of our course it may be useful to draw a parallel with the Brazilian educator, Paulo Freire, who reminds us to embrace the notion of pedagogy as dialectical practice.

James MacDonald writes

"The concept of praxis is a valuable one, especially when used as Freire does to mean action with reflection, in distinction from either reflection without action (intellectualism) or action without reflection (activism). Thus, (social studies) curriculum development is seen as praxis or action with reflection."

(MacDonald, 1975)

Assignments: (see contract sheet for grading criteria)

- Term 1
 - X Small extra/intra class exercises
 - 1. Oral Presentations of a Selected Tradition
 - 2. Critical Review of a Selected Tradition Due November 14.
 - 3. Personal Position or Social Studies Rationale Paper Due December 12.
- (463)
- Term 2
 - X Small extra/intra class exercises
 - 1. Micro-Teaching Session with Alternative Approaches.
 - 2. Development of Comprehensive Curriculum Unit.
 - 3. Development of Resource Unit or Research/Book Review.

Course Schedule Ed. C.I. 462 Sept. - December 1980

Sept. 18

Theme: Course Structure: Personal and Pedagogical Commitments

Topic 1 (Personal Backgrounds) Topic 2 Approaches to the Social Studies

Resources: Course outlines, rationale and group biographies

APPENDIX VI

A Schematic History of Conservative,
Liberal and Radical Factions within Educational
Progressivism 1930-1970

Any discussion of the structure and significance of progressivism and educational theory in North America of the period 1950-1980 must take account of its internal history. A fuller analysis might begin such a discussion by linking figures such as Dewey, Pierce, Beard, Veblen, pragmatist philosophy and experimentalism in science and social policy with the phases of liberal and monopoly capitalism that North American society passed through from 1870-1930.

In this Chapter I provide a profile of some of the major figures inside progressivism and how their philosophical, pedagogical, and political views were often sharply at odds with one another. As conservative, liberal, and radical factions within progressivism their structural expectations for societal reform differed substantially. But, pedagogically, conservative-liberal theorists and radical theorists, in the fifty year glimpse of progressivism that I provide, have shared a common ground of curricular and methodological prescriptions for school life. However, as this study argues, form and content go hand in hand in research discourse that organizes itself for radical praxis in school and society. Because form reciprocates with content it is important that I demarcate with some clarity the major intellectual and political schisms within progressivism from 1930-80. It is from an intellectual and political sociology of the range of normative positions taken, particularly by the radical progressives, that we can learn and appraise as reflective theorists what necessary organizational elements might be incorporated in our utopian projects of radical curriculum change.

Progressivism in its educational expressions is characterized by both its diversity and homogeneity of positions on political organization and methodological preparation respectively. The field in North America can be divided according to my research for this study, and by Bowers (1969), Cremin (1961), Williams (1961) and others into recognizable liberal-conservative factions, and radical Marxist and non-Marxist factions. If the reader accepts this distinction, for the period 1930-1980; (that is, the ascendancy and peaking of monopoly capitalism) then it is possible to identify three paradigmatic phases of progressivism within each faction. The liberal conservative faction from pre-1920 included such figures as John Dewey, William Kilpatrick, and Francis Parker who drew from the text 'Democracy and Education' for their exegetical inspiration. The period 1920-50 in the liberal-conservative

faction sees figures such as Harold Rugg, George Counts, and John Childs as pre-eminent in depression era progressivism - reinterpreting Dewey's pedagogy in more socially active terms.

The period 1950-1980 for liberal progressivism is best characterized by the work of men such as Donald Oliver, James Shaver, and A. Guy Larkins - as one instance of a liberal democratic framework.

Radical reconstructionists or the left progressives can be paradigmatically grouped in three parallel clusters for the period 1930-1980. The signs in educational theory that reflected a radicalization of Deweyan pragmatism and from which his influence was later removed were found in the work of George Counts, Theodore Brameld, Norman Wolfel, and Mordecai Grossman. The first paradigm of radicalization in progressivism coincided with the most severe years of the Depression, 1931-34. Counts was a transitional figure in terms of this paradigmatic classification since he steadily grew less radical. Finally, in the 1950's Counts had 'officially' abandoned progressivism for a more classical philosophical rationale. I would date the first sustained North American expression of radical progressivism from 1930-1950.

The second period, 1950-1965, of left progressivism and variants of socialism includes figures such as Sidney Hook, although not an educator, Theodore Brameld, George Axtelle, Bruce Raup, Kenneth Benne, William Stanley, and Herbert Marcuse. This group was a highly diverse collection of theorists whose views ranged from orthodox Marxist vanguardism, socialist reformist, left-leaning liberalism, and romantic naturalism. At that time each wanted schools either to promote socialist revolution or to repair democracy through adherence to pre-determined group norms. This cluster of theorists, bound in their commitment to the school as an agency of political indoctrination or of social repair, formed their common interest primarily in fighting an increasingly conservative rearguard action by other factions in the Progressive Education Association (P.E.A.) This ideological struggle continued until the 1947 breakthrough and capitulation of the association to the left progressives.

The third period of left progressivism that I consider can be demarcated covers the period 1965-1980. Figures in this period include Herbert Marcuse, the critical social theorist, Theodore Brameld once again, Issac Berkson, Harold Berlak, Ira Shor, groups such as Students for a Democratic Society (S.D.S. 1965), Quebec Teachers' Corporation (C.E.Q. 1975) and others in the United States and Canada. The figure

that bridges these political and educational paradigms for the left is Theodore Brameld whose thought matures and diachronically incorporates a number of 'progressive' positions for global, educational provision and socialist consciousness over a forty year period to the early 1970's. Brameld singularly demonstrates, of all the progressivist theorists of liberal and radical factions, a deepening radicalization and global socialist thrust in his political and educational strategies. Ultimately, Brameld was to drop the pragmatist legacy of John Dewey as an encumbrance in his (Brameld's) conceptualization of a socialist education. Brameld is the only figure who finally crystallizes the different factional strands of the progressive era by claiming that 'progressivism does not have a place for Marx but reconstructionism does.' (Brameld, 1957)

Clearly, the liberal-conservative progressives and the left reconstructionists have a common philosophical heritage in Dewey's pragmatism. The actual linkages with this philosophy are soon left behind, although this was not acknowledged in the 1930's, since pragmatism did not allow a platform for radical dissent and social criticism through institutionalized schooling. Yet the two factions do not co-exist for the same time periods either but rather overlap as periods of reaction and counter-reaction to one another. The history of science is replete with this pattern of lag and leap in formal knowledge diffusion and societal re-organization.

What must be argued, however, for the purposes of this study are two items as a result of this historical sketch. Firstly, Theodore Brameld does require redress in the history of educational thought as a sophisticated radical socialist educator. Brameld along with Sidney Hook, for a time Michael Harrington, and Herbert Marcuse firmly believed in the indispensability of Marxist analyses of the state, of political-revolutionary organization, of studies of alienation and consciousness for educational philosophy and projects of social reconstruction in the eras of monopoly and organized capitalism.

Brameld also viewed pragmatist philosophy as a philosophy of transition in that it acts as a symbolic bridge between structurally dissimilar eras of capitalism; that is, liberal entrepreneurial and organized capitalism. It acts as a particular world view that prepares a generation of workers for changes in world relations, and a shrinkage in social-psychological autonomy.

Secondly, this chapter has shown the inner complexities of progressivist history and implications for critical human practice in education. Anyone of these figures in this fifty year period we can learn historical lessons from

methodologically, politically, and philosophically in our roles as teachers, curriculum developers, and as theorists in our struggles toward autonomy/responsibility in economic, political, and educational relations. This study convenes, however, on a particular practical note that has to do with the idea and the received understanding of progressivist or liberal reform traditions. School life, curricular innovations, and teacher professional vocabularies of the 1960's, '70's, and '80's are particularly saturated with this legacy of liberal progressivist reform. It has become a pervasive technical ideology of convenience for school/curricula reforms and repressions of every political-cultural type. That is, reforms in schools that range from integrated days, open classrooms, community schooling, extreme individualization in subject electives, to mandatory core curricula are justified on the basis of a dimly-appreciated progressivist sentiment. The use of progressivist vocabulary has provided a convenient justifying ideology for a range of repressive pedagogical manoeuvres over the twenty year period, 1960-1980.

The use of dehistoricized remnants of progressivist sentiment and language allows closure of questions that would undermine the authoritarian organization of school life and curriculum decision-making. For this study, the received effects of liberal progressivist reform, as a materially consequential symbol system for school and curricular organization in late capitalist society is the central - most reality that needs to be unpacked ideologically, conceptually, and methodologically by the practical method of this study. I am drawn to this particular critical project because strategically, reformist speech, social relations, and practices in our institutions comprise much of the dense texture of everyday reality that teachers and curriculum theorists/developers must continually contend and live with.

In short, then, the study seeks not to provide an exhaustive review of progressivist and reconstructionist history but instead seeks to characterize the importance of its received legacy for current teacher education and curriculum practices. In other words, I situate the study in the here-and-now of received tradition and everyday school practices for those practices are what must first be recognized, then resisted, and finally transcended by teachers and other curriculum workers in the service of a global socialist transformation in social learning and political-economic relations. Acute, intellectual portraits of key progressivist and reconstructionist figures are important for the renewal and celebration of socialist historiography in North America. This study, as a praxis, is a kind of curriculum research that points to these allied possibilities for radical scholarship in educational thought. It does not accomplish them wholly in itself.

It is important in order to recover the vibrancy of progressivist educational theory and to determine its limits and possibilities as a philosophy in our time, that we recognize its child-centered faction as quite distinct from its social reconstructionist faction. These two factions grew more shrill in expression as the economic depression deepened (in North America) and the second world war took place. A series of conservative counter-reactions and retreats occurred in progressivism within both factions immediately prior to and in the post-war reconstruction period. The only consistent philosophical and political position throughout this 25 to 30 year 'half life' of progressivism is represented by Theodore Brameld. He steadily eroded the influence of Dewey and 'progressively' deepened the contribution of Marx to his social reconstructionist philosophy. The struggle for hegemony in the progressive education movement and the nature of what 'progressivism' would become was conducted across quite distinct ideological loci in North America during the period 1932-1947.

After the 1947 ~~reformation~~ of the P.E.A. progressivism was transformed by ~~the~~ and conservative elements into a severely-instrumentalized, social engineering conception of reconstructionism. Life-adjustment education, and group-normed curricula occupied much of the left-liberal progressivists for the second half of the decade 1950-1960. By the late 1950's the conservative counter-reaction popularized by such figures as Arthur Bestor, Robert Hutchins, and Mortimer Smith and the nationalist fear brought on by the Soviet space achievements (Sputnik era) sealed any mainstream educational expression or public receptivity for radical reconstructionism.

The vocabulary of Deweyan experimentalism was to live on in the national curriculum projects and regional program innovations of the military-industrial, and social-industrial complexes (O'Connor, 1973) of late capitalist society. The values clarification, public issues, and social inquiry curricula of the period 1965-1980 are exemplars of these neo-progressivist, neo-conservative residues. The power and politics of educational sloganeering has been a real force, according to educational historians (Karier, Violas, Spring, 1973; Katz, 1971; Feinberg, 1975). Such 'cultural systems' (Apter in Geertz, 1973) are seen as sophisticated measures for capital retrenchment and extension, and for the manipulation of consciousness and public social interests. Progressivist thought as an array of ideological, symbolic contents that have been strategic for the state in their mass motive-forming power seem to have virtually dissipated in the present era. This time of retrenchment, deindustrialization, and de-skilling of masses of technical and professional workers now begins to draw upon a different educational cosmology in order to justify and distribute student achievement, stratification, and future vocational expectations.
