CYDL Project One Overview

Overview of the CYDL initiative and Project One

The **Child and Youth Data Laboratory (CYDL)** analyzes and interprets linked administrative data from child- and youth-serving ministries in the Government of Alberta. The data are linked across ministries, at the level of the individual child or youth. Ministry involvement at all stages ensures policy relevance.

CYDL's research projects provide groundbreaking opportunities to understand relationships between many of the factors critical to children's lives, in broad-use areas such as health and education as well as more specialized services such as justice system contact or receipt of income support. The research results make unique contributions to the knowledge base on the well-being of children and youth, and can be used for enriched policy and program development and evaluation.

Project One is focused on basic understanding of the experiences of Albertan youth 12 to 24 years old in 2008/09. Service use data were provided by the ministries, and individuals receiving services from different ministries were linked by an anonymous process. A series of 15 short reports on policy-relevant topics has been produced (e.g., "Mental health status of Albertan youth", "Maltreatment-related investigations among Albertan youth", "Corrections involvement among Albertan youth", etc.).

It is expected that the results of Project One will generate further research questions, to be explored in subsequent projects. The second planned project extends Project One by looking at the experiences of youth in Alberta over a six-year time period, so that we can begin to develop more detailed insight into the factors that shape our youth as they develop. Future projects will be shaped by these two projects.

Some notes on the data

Administrative data are collected as part of the administration of ministries' services, such as organizing payments to physicians or tracking student enrolment data or classifying categories of income support recipients. Constructs useful for research purposes must be derived from indicators captured in administrative data and are therefore proxies for the underlying constructs. Validation of the data at source will vary across indicators, and will be dependent on administrative need for validation rather than on research need for accuracy and completeness.

On the other hand, administrative data provide richness that is absent from more traditional types of research. Administrative data used by CYDL are population-wide, allowing us to investigate virtually all of Alberta's youth. The level of detail collected for administrative purposes can be high, enabling in-depth investigation in many cases.

The linkage process employed by the CYDL preserves privacy while enabling this exciting and unprecedented opportunity to understand so many diverse facets of the lives of Albertan children and youth. However, analyses resulting from the linkage process must be interpreted with the understanding that some false matches (both incorrect matches and missed matches) will occur in the data, although they are thought to be relatively rare. Thus, the population of Albertan youth being considered in each short report (those that use ministry services, and could be linked with the software) is a subset of all youth.

CYDL Project One Report Summaries

Socio-economic status of Albertan youth

Socio-economic status of Albertan youth is an overview of the socio-economic status of 680,043 Albertan youth in 2008/09. Pampalon et al.'s neighbourhood deprivation index¹ was used to determine the social and material environments in which youth lived. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single parent families, percent of persons living alone, and percent of persons separated, divorced, or widowed.

The report contains analyses of the relationships between socio-economic status and age, gender, region of residence, educational achievement, mental health status, health service use, and interactions with Enterprise and Advanced Education, Human Services, and Justice and Solicitor General.

- The most socio-economically advantaged environments were experienced more often by youth who were younger, living in large urban centres, or achieving above educational expectations. Youth who pursued a post-secondary education were also more likely to live in higher socio-economic status neighbourhoods. The most socio-economically advantaged youth were less likely to visit emergency rooms or be hospitalized than youth living in the lowest socio-economic neighbourhoods.
- Youth facing challenges, such as receiving maltreatment-related intervention services, receiving Family Support for Children with Disabilities services, being charged with an offence, being involved with corrections, or receiving income support, were more likely to be living in low socio-economic neighbourhoods than youth not facing these challenges.

Educational experiences of Albertan youth

Educational experiences of Albertan youth is an overview of the educational experiences of 272,588 Albertan youth aged 12 to 20 years registered in Alberta's K-12 education system in 2008/09. Educational achievement was categorized as above, meeting, or below expectations for a student's age and grade. School authority types included public, separate, Francophone, charter, private, and other. No data were available for students who attended schools on First Nations reserves or in Lloydminster.

The report describes how educational achievement and school authority type varied by age, gender, region of residence, socio-economic status, mental health status, and health service use. The cross-ministry service use of youth registered in K-12 education was also studied.

- 79% of youth 12 to 17 years old and 17% of youth aged 18 to 20 were registered in the K-12 education system. 68% of students were meeting educational expectations, 19% were below expectations, and 11% were exceeding expectations.
- Overall, most students were meeting or above educational expectations. Students performing below educational expectations were more likely to be male, to live in a lower socio-economic status neighbourhood, to have received services for a mental health condition, to visit an emergency room, or to be hospitalized during the year.
- Poor educational performance was associated with receiving maltreatment-related intervention services, receiving Family Support for Children with Disabilities services, being charged with an offence (particularly multiple charges), being involved in corrections (particularly custody), or receiving income support at some point during the year 2008/09.
- 73% of youth were registered in public schools, and 22% in private schools. School authority type varied with age, region of residence, socio-economic status, educational achievement, mental health status, and emergency room use.
- Students facing challenges, such as receiving intervention services, being charged with an offence, or receiving income support, were more likely to be registered in public schools than any other school authority type.

Mental health status of Albertan youth

Mental health status of Albertan youth is an overview of 66,792 Albertan youth (12 to 24 years) who received services for mental health conditions in 2008/09. Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition.

The relationships between mental health status and age, gender, region of residence, socio-economic status, educational achievement, and health service use were considered. The cross-ministry service use of youth who received services for mental health conditions was also studied.

- 11% of Albertan youth received services for mental health conditions in 2008/09.
- *Mood/anxiety* and *behavioural* disorders were the most common mental health conditions, with *mood/anxiety* conditions generally more common in females and *behavioural* conditions more common in males. The percentage of youth with mental health conditions increased with age for females, but was stable across age for males.
- There was little effect of region of residence or socio-economic status on mental health status.
- The rate of mental health conditions was higher for youth who performed below educational expectations, who visited physicians five or more times, who visited emergency rooms, or who were hospitalized (youth with *schizophrenia/psychoses* were particularly likely to be hospitalized).
- Youth who received maltreatment-related intervention services, were charged with an offence, were involved in corrections, were enrolled in a part-time post-secondary program, or received income support were more likely to have received services for a mental health condition than youth who did not have these ministry service involvements.

Family Support for Children with Disabilities services received by Albertan youth

Family Support for Children with Disabilities services received by Albertan youth provides a profile of 3,764 Albertan youth (aged 12 to 18 years) who received Family Support for Children with Disabilities (FSCD) program services from Human Services in 2008/09. Service categories include *family support* services, *child-focused* services, *specialized* services and *out of home* services. In addition, FSCD assists with some of the extraordinary costs of raising a child with a disability. To receive FSCD services, medical documentation must be provided confirming that the child has a disability or is awaiting a diagnosis; primary diagnoses categories are derived from these medical diagnoses. Not all eligible families choose to access the FSCD program and there are additional health and education programs that support children with disabilities. As such, there are more children with disabilities in the province than those who receive FSCD services.

Youth are described by FSCD service category, primary disability diagnoses, age, gender, region of residence, socio-economic status, school authority type, educational achievement and health service use. The report also provides an overview of cross-ministry service use for these youth

- 1.0% of Albertan youth aged 12 to 18 received FSCD services in 2008/09.
- Overall, the majority of youth receiving FSCD services received *child-focused* services and had a primary diagnosis of a developmental impairment.
- Compared to youth not receiving FSCD services, youth who received FSCD services were more likely to be male, younger than 15 years of age, to live in low middle socio-economic status neighbourhoods, to perform below educational expectations, and to have higher use of health services.
- Youth receiving FSCD services were more likely than youth not receiving FSCD services to be enrolled in Alberta's K-12 education system, to receive maltreatment-related intervention services or to receive income support.

Maltreatment-related investigations among Albertan youth

Maltreatment-related investigations among Albertan youth provides a profile of 7,029 Albertan youth (aged 12 to 17 years) who were the subjects of investigations into possible maltreatment by a parent/guardian in 2008/09. In investigated cases where intervention is not needed, the file is closed (*no intervention needed*). Cases where maltreatment is found to have occurred can lead to interventions that include services within the family home (*out of care services*), or that require the youth to be removed from their home and placed *into care*.

Youth are described in terms of the outcome of the investigation and their Aboriginal status by age, gender, region of residence, socio-economic status, educational achievement, mental health status and health service use. The report also provides an overview of cross-ministry service use for these youth. Comparisons are made to youth of the same ages who were not the subjects of investigations.

- For most investigations, the outcome was *no intervention needed*. 29% of youth investigated were Aboriginal.
- Compared to those not investigated, youth who received a maltreatment-related investigation were more likely to be non-Aboriginal, female, younger than 15 years of age, living in a rural area (*in care* youth only), living in the lowest socio-economic status neighbourhoods, performing below educational expectations, and to have used services for a mental health condition or to have high use of health services.
- Youth who were the subject of an investigation were more likely to be receiving Family Support for Children with Disabilities (FSCD) services, to be charged with an offence, or to be involved in corrections, than youth not investigated.
- Aboriginal youth receiving investigations were more likely than non-Aboriginal youth to receive *in care* services, to live in rural areas or the lowest socio-economic status areas, or to be performing below educational expectations. They were less likely to have received services for a mental health condition, and were less likely to have had five or more physician visits.
- Aboriginal youth receiving investigations were more likely than non-Aboriginal youth to have been charged with an offence or involved with corrections, and less likely to be enrolled in the K-12 education system or to be receiving FSCD services.

Maltreatment-related intervention services received by Albertan youth

Maltreatment-related intervention services received by Albertan youth provides a profile of 6,400 Albertan youth (aged 12 to 17 years) who received intervention services in 2008/09 as a result of maltreatment. Depending on the situation, intervention services may be provided while the youth remains in the home (*out of care services*), or the youth may have to be removed from the home and placed *in care* because of ongoing and serious safety concerns.

Youth are described in terms of the type of intervention services they received and their Aboriginal status, by age, gender, region of residence, socio-economic status, educational achievement, mental health status and health service use. They are compared with youth not receiving intervention services. The report also provides an overview of cross-ministry service use for youth receiving intervention services.

- 2.1% of Albertan youth received intervention services; of these 62% were *in care*, and almost half were Aboriginal.
- Compared to youth not receiving intervention services, youth who received intervention services were more likely to live in the lowest socio-economic status neighbourhoods, to perform below educational expectations, to have a mental health condition (particularly mood or behavioural conditions), or to have five or more physician visits, an emergency room visit, or a hospitalization.
- Compared to youth not receiving interventions, youth receiving intervention services for maltreatment were over-represented in Family Support for Children with Disabilities (FSCD) and the justice and correctional systems, and were slightly more likely to be in the K-12 education system.
- Among youth receiving intervention services, Aboriginal youth were more likely to be *in care*, living in rural settings or the lowest socio-economic status neighbourhoods, or performing below educational expectations, compared to non-Aboriginal youth. Aboriginal youth were also less likely to have received services for a mental health condition, to have had five or more physician visits, and were slightly less likely to be hospitalized.
- Aboriginal youth receiving intervention services were less likely to be receiving FSCD services or to be registered in the K-12 education system than non-Aboriginal youth.

Physician visits by Albertan youth

Physician visits by Albertan youth is an overview of 2,361,770 physician visits by 496,787 Albertan youth (12 to 24 years) in 2008/09. Physicians were grouped into two types of providers: specialists and general practitioners. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The report contains analyses of the relationships between number of physician visits as well as type of physician with region of residence, socio-economic status, age, gender, educational achievement and mental health status. The cross-ministry service use of youth who visited physicians was also described.

- 49% of youth had one to four physician visits and 26% had five or more physician visits, while 24% of youth had no physician visits. 64% of visits were with a general practitioner and 36% were with a specialist.
- Number of physician visits increased with age for females and decreased with age for males. Youth who were performing above educational expectations or who received services for a mental health condition were more likely to visit a physician.
- About two thirds of visits were to general practitioners; visits to specialists were less common among visits for older youth and females. Visits to specialists were more common among visits by youth who were performing above educational expectations than those below, or among those who had *neurodevelopmental* or *schizophrenia/psychoses* conditions than those with other mental health conditions.
- Socio-economic status and region of residence were unrelated to number of physician visits or to provider types.
- Making five or more physician visits in the study year was more common for youth on income support, youth receiving Family Support for Children with Disabilities services, youth who received maltreatment-related intervention services, and youth who were enrolled in a post-secondary institution, compared to the whole population of youth registered with Alberta Health Care.

Emergency room visits by Albertan youth

Emergency room visits by Albertan youth is an overview of 326,685 visits to emergency rooms by 163,411 Albertan youth (aged 12 to 24) in 2008/09. Reasons for emergency room visits were derived from primary diagnostic codes. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The relationships between emergency room use and age, gender, region of residence, socio-economic status, educational achievement, and mental health status were analyzed, as was the cross-ministry service use of youth who visited emergency rooms.

- 15% of youth had a single emergency room visit and a further 10% had multiple emergency room visits. The most common reason for visit was *injury or poisoning*.
- The number of emergency room visits increased with age to about 19 years, then decreased. Females aged 16 and older were more likely to have multiple emergency room visits than males of those ages. Youth living in rural areas and those living in the lowest socio-economic status neighbourhoods had higher rates of emergency room use than those living in urban areas or in the highest socio-economic status areas. Performing above educational expectations and absence of a mental health condition were associated with lower rates of emergency room use.
- Visits for *injury or poisoning* were most likely for youth aged 12 to 20 while emergency room visits for *other* reasons were most likely for youth aged 21 to 24. Visits for males were most often for *injury or poisoning* whereas visits for females were most likely for *other* reasons. Visits by youth performing below educational expectations were more likely to be for *mental or behavioural* reasons and less likely to be for *injury or poisoning* than visits by youth meeting or above expectations.
- Youth receiving income support were most likely to make multiple emergency room visits and those enrolled in post-secondary education were least likely to do so. Single emergency room visits were most common among youth with offence charges or involved in corrections and least common among post-secondary students.

Hospitalizations of Albertan youth

Hospitalizations of Albertan youth is an overview of 29,676 hospitalizations of 24,067 Albertan youth (12 to 24 years) in 2008/09. Type of service was determined from main service codes. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The relationships between hospitalizations and age, gender, region of residence, socio-economic status, educational achievement and mental health status were considered. The cross-ministry service use of youth who were hospitalized was also studied.

- 3.1% of youth were hospitalized once and 0.6% had multiple hospitalizations. The most common services were pregnancy-related, surgery or procedures, and general medicine.
- Males and females had similar rates of hospitalization when pregnancy-related hospitalizations for females were excluded.
- Hospitalized youth tended to live in rural or mid-sized regions or in low socio-economic status areas, perform below educational expectations, or receive services for a mental health condition (youth with *schizophrenia/psychoses* were particularly likely to be hospitalized).
- Most hospitalizations for youth aged 17 and under were for a surgery or procedure or for general medicine. Hospitalizations for youth aged 18 and older or youth living in the lowest socio-economic status neighbourhoods were most often pregnancy-related. Youth performing below educational expectations were more likely to have pregnancy-related or psychiatric hospitalizations than youth doing better in school. Hospitalizations among youth with mental health conditions were more likely to be for *psychiatric* services and less likely for *surgery or general procedures* than hospitalizations among youth without mental health conditions.
- Hospitalization rates were highest for youth who received maltreatment-related intervention services, were charged with an offence, were involved in corrections, received Family Support for Children with Disabilities services, or received income support.
- Psychiatric hospitalizations were most common among hospitalizations for youth receiving intervention services or involved in justice or corrections.

Offence charges among Albertan youth

Offence charges among Albertan youth is an overview of 6,311 Albertan youth (12 to 17 years) charged with offences in 2008/09. Youth with offence charges include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). Number of offences in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.

The relationships between number of charges and age, gender, region of residence, socio-economic status, educational achievement and mental health status were considered. Youth charged with offences in the study year were compared to youth of the same ages not charged with offences in the study year. The cross-ministry service use of youth with offence charges was also studied.

- 2.1% of youth were charged with an offence in the study year. Of these, 44% had one charge in the year, 29% had two or three charges, and 27% had four or more charges.
- Offence charges were most common among youth aged 16 to 17.
- Males were more than twice as likely as females to be charged with offences, particularly multiple offences.
- Youth charged with offences were more likely than youth not charged with offences to live in lower socio-economic status neighbourhoods, to perform below educational expectations, to receive services for a mental health condition, or to visit an emergency room or be hospitalized.
- Youth with offence charges, particularly those with four or more charges, were more likely to receive maltreatment-related intervention services than youth without offence charges.

Corrections involvement among Albertan youth

Corrections involvement among Albertan youth is an overview of 5,178 Albertan youth (2% of youth aged 12 to 17 years) who were involved in corrections in 2008/09. Youth with corrections involvement have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (in which the sentence is served in the community) or custody (in which the sentence is served in a young offender facility).

Type of corrections involvement and Aboriginal status of youth involved in corrections were considered, along with age, gender, region of residence, socio-economic status, educational achievement, and health service use. Youth involved in corrections were compared to youth not involved in corrections. The cross-ministry service use of youth involved in corrections was also studied.

- 1.7% of Albertan youth were involved in corrections in 2008/09; 18% of these were in custody at some point in the year.
- Youth involved in corrections were primarily older teenagers who were male. One in four youth involved in corrections was Aboriginal.
- Compared to youth not involved in corrections, youth involved in corrections were more likely to live in the lowest socio-economic status neighbourhoods, to perform below educational expectations, to receive services for a mental health condition, to visit an emergency room, to be hospitalized, or to receive maltreatment-related intervention services. All of these effects were larger for youth in custody than for youth with community sentences or pre-trial supervision.
- Aboriginal youth involved in corrections were more likely than non-Aboriginal youth involved in corrections to live in rural regions or the lowest socio-economic status neighbourhoods, to visit emergency rooms, to be hospitalized, or to receive maltreatment-related intervention services. They were less likely to meet or exceed educational expectations.

Post-secondary students in Alberta

Post-secondary students in Alberta profiles 113,154 youth (aged 17 to 24 years) who were enrolled in Alberta's post-secondary institutions in 2008/09. *Credential types* for post-secondary programs include bachelor/applied/graduate programs (also called degree-granting), certificate/diploma programs, and programs with no credential received upon completion. *Enrolment status* refers to full-time or part-time enrolment. Youth enrolled in apprenticeship programs were not available in this study.

Age, gender, region of residence, socio-economic status, mental health status, health service use, credential type, enrolment status, receipt of maltreatment-related intervention services, and receipt of income support are detailed. Comparisons are made with youth of the same ages who were not post-secondary students.

- 24% of all youth 17 to 24 years old were attending post-secondary institutions, with the highest rate (35%) for 20 year olds.
- More females than males were pursuing a post-secondary education. Females were also more likely than males to be enrolled in degree-granting programs.
- Post-secondary students, especially those enrolled in degree-granting or full-time programs, were more likely to be living in the highest socio-economic status neighborhoods than youth not enrolled in post-secondary institutions. Youth not enrolled in post-secondary studies were more likely to have visited an emergency room or to have been hospitalized at least once during the year, and were more likely to have five or more physician visits during the year.
- Post-secondary students enrolled part-time or in *no credential* programs were more likely than those enrolled full-time or in credential programs to have a mental health condition or to have been hospitalized at least once during the year.
- Youth receiving maltreatment-related intervention services or income support were over-represented in *no credential* programs and part-time programs compared to other post-secondary students.

Income support among Albertan youth

Income support among Albertan youth provides a profile of 6,599 Albertan youth (aged 18 to 24 years old) who received income support at any point in 2008/09. Human Services provides financial benefits to individuals and families who do not have the resources to meet their basic needs, such as food, clothing and shelter. Client types are those with *barriers to full employment* and those *expected to work*. Youth who received income support while upgrading or training (*learners*) were excluded. Household types are singles or couples, with or without children.

The report looks at the relationships between income support client type and household type and age, gender, region of residence, socio-economic status, educational achievement, mental health status, and health service use for youth who received income support. These youth are compared with youth who did not receive income support. An overview of cross-ministry service use for youth receiving income support is also included.

- 1.6% of youth received income support at some point in 2008/09. 54% of these were *barriers to full employment* clients and 46% were *expected to work* clients. 60% were *singles*.
- Females were over-represented among income support clients who were *singles* with children or *expected to work*; males were predominant among *singles* without children.
- Income support clients were more likely than youth (aged 18 to 20 years) not receiving income support to live in mid-sized centres, to live in low to middle socio-economic status neighbourhoods, to perform below expectations in high school, to receive services for a mental health condition, and to have high health service use or no health service use.
- Compared to youth who did not receive income support, income support clients were less likely to be in the Alberta Health Care Insurance Plan (AHCIP) registry or enrolled in a post-secondary institution, but were more likely to be receiving maltreatment-related intervention services. *Barriers to full employment* clients or *singles* without children were more likely than youth who did not receive income support to be enrolled in high school.

Educational experiences of Albertan youth with income support activity

Educational experiences of Albertan youth with income support activity is an overview of the educational experiences of 2,445 Albertan youth (aged 18 to 24 years old) who at any point in 2008/09 received income support. Human Services provides financial benefits to individuals and families who do not have the resources to meet their basic needs, such as food, clothing and shelter. Client types are those with *barriers to full employment* and those *expected to work*. Youth who received income support while upgrading or training (*learners*) were excluded. Household types are singles or couples, with or without children. For high school students, school authority type is considered. For post-secondary students, institution type, credential type, and enrolment status are considered. *Youth were not necessarily simultaneously receiving income support and attending high school or post-secondary institutions.*

The report describes client types and household types of youth with any income support activity who were enrolled (not necessarily at the same time) in an educational program, as well as relationships with age, gender, region of residence, socio-economic status, mental health status, and health service use. These youth were compared to youth enrolled in high school or post-secondary programs but not receiving income support.

- 549 Albertan youth (aged 18 to 20) who had any income support activity were registered in high school, and 378 Albertan youth (aged 18 to 24) who had any income support activity were enrolled in post-secondary institutions at some point in 2008/09.
- Youth with any income support activity who were registered in high school were most likely to be clients with *barriers to full employment*, single, female, living in large city centres, living in the lowest socio-economic status neighbourhoods, receiving services for a mental health condition, having a high rate of health service use, and performing below educational expectations.
- Youth with any income support activity who were enrolled in post-secondary institutions were likely to be clients with *barriers to full employment*, female, single, part-time students, enrolled in community or independent institutions and enrolled in *no credential* programs.

Least advantaged and most advantaged Albertan youth

Least advantaged and most advantaged Albertan youth provides a profile of the 2,281 least and 7,517 most advantaged Albertan youth between 12 and 17 years who were receiving provincial government services in 2008/09. *Least advantaged* is defined here as youth who were performing below educational expectations in the K-12 education system, who had a mental health condition, and who were living in the lowest socio-economic status neighbourhoods. Conversely, *most advantaged* youth performed above educational expectations, did not have a mental health condition, and lived in the highest socio-economic status neighbourhoods.

The relationships between advantage status and age, gender, region of residence, and health service use are examined for least and most advantaged youth, in comparison to remaining Albertan youth. The cross-ministry service use of least and most advantaged youth is also considered. The report concludes with a look at the educational achievement of youth experiencing challenges.

- 1.1% of Albertan youth were least advantaged, and 3.6% were most advantaged.
- The least advantaged youth were more likely than the remaining youth to be male, live in rural areas, be hospitalized, visit an emergency room, or receive maltreatment-related services; most advantaged youth were less likely than remaining youth to have these characteristics.
- Additionally, least advantaged youth were more likely than the remaining youth to visit physicians five or more times, to receive Family Support for Children with Disabilities services, to be charged with an offence, or to be involved in corrections. *Psychiatric* or *pregnancy-related* hospitalizations and *mental or behavioural* emergency room visits were more common among hospitalizations and emergency room visits for least advantaged youth than for the remaining youth.
- Additional analyses looked at challenged youth (such as youth involved in corrections or receiving maltreatment-related services), and found that, despite the challenges they faced, some youth performed well in school. Better educational outcomes were associated with being female, living in a higher socio-economic status neighbourhood, not having a mental health condition, and lower rates of health service use.

CYDL Project One Short Reports

Key report components and how to use them

Key findings

Each report begins with descriptions of the population of youth being studied, the concepts appearing in the report, and the kinds of analyses that were done. Following that are key findings from the various analyses, which serve as a high-level summary of the report.

Context

The context section of each report, on the second page, provides a short review of the relevant literature, intended as background for the report.

Analyses sections

Several pages of each report consist of analyses of the relevant indicators for the population being studied. There are two or three analyses sections on each page.

The first (non-bulleted) paragraph of each section describes the population being studied, including the number of youth and the percentage of the entire study population that this population represents. In subsequent analyses, if the population being analysed changes in any way (i.e., if only a portion of the overall report population is analysed), then the first (non-bulleted) paragraph of that section describes this population.

Bullets in each section describe, briefly, the findings of the analysis. Interpretations of the data are provided only in those cases where chance of misinterpretation was deemed to be high.

A graph accompanies each analysis, providing a visual of the data. Tables in the back of the report provide the numbers that appear in the graph. Each analysis section has a title, which includes the page numbers for the relevant data tables.

Tables

Following the analyses sections are tables. These tables contain all values appearing in the graphs, and sometimes provide additional data not appearing in the graph or the bullets of the analysis section.

Definitions and notes

Definitions and notes follow the tables. These provide information critical to the interpretation of the findings in the report, and should be carefully read before conclusions are reached.

Data sources

The table of data sources provides information on the administrative databases which were the source of data for the project.

Child and Youth Data Laboratory (2012). *CYDL Project One Technical Report*. Edmonton: Alberta Centre for Child, Family and Community Research.

PROJECT BACKGROUND

THE CYDL INITIATIVE

The Child and Youth Data Laboratory (CYDL) analyzes and interprets linked administrative data from child- and youth-serving ministries in the Government of Alberta. The data are linked across ministries, at the level of the individual child or youth.

CYDL's research projects provide groundbreaking opportunities to understand relationships between many of the factors critical to children's and youth's lives, in broad-use areas such as health and education as well as more specialized services such as justice system contact or receipt of income support. The research results make unique contributions to the knowledge base on the well-being of children and youth, and can be used to support integrated policy development and coordinated program services.

The CYDL is managed by the Alberta Centre for Child, Family and Community Research (ACCFRCR). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

CYDL research projects are governed by a number of committees, three working groups, the Hub and the Lab itself. Descriptions of the roles of the various groups are in Appendix I.

PROJECT DESCRIPTION

The current project, *Experiences of Albertan Youth 2008/09*, is a snapshot of the experiences of Albertan youth (12 to 24 years old) in 2008/09. It describes the characteristics and service use patterns of the population with a focus on mental health, educational achievement, and socio-economic status. A series of short reports on policy-relevant topics has been produced (e.g., *Mental health status of Albertan youth*, *Albertan youth receiving intervention services for maltreatment*, *Albertan youth charged with an offence*, *A profile of post-secondary students in Alberta*, etc.).

It is expected that the results of Project One will generate further research questions, to be explored in subsequent projects. The second planned project extends Project One by looking at the experiences of youth in Alberta over a six-year time period, so that we can begin to build more detailed insight into the factors that shape our youth as they develop. Future projects will be shaped in part by learnings from these two projects.

PARTNERING MINISTRIES

Alberta Government ministries, through their work in committees, working groups, and the Hub, participated in governance, provided funding or in-kind contributions, identified research priorities and a research agenda, participated in the development of research questions and the identification and development of data elements, developed privacy impact assessments and information sharing agreements, prepared data extracts and submitted them, generated a file to link research data with identity resolution data, participated in the validation of data and analyses, assessed adherence to data disclosure guidelines, and reviewed and approved reports.

The following six Alberta government ministries participated in Project One:

Aboriginal Relations
Education
Enterprise and Advanced Education
Health
Human Services
Justice and Solicitor General

The *Aboriginal Relations* ministry works with Aboriginal communities, the federal government, industry and other stakeholders to promote social and economic opportunities to enhance the quality of life of Aboriginal people in Alberta.

Education is the ministry that leads the education system from Early Childhood Services through grade 12. Education is responsible for curriculum development and evaluation, teacher development and certification, support of special needs students, funding and support of school boards, provision of Aboriginal and Francophone education, management of the Alberta Initiative for School Improvement (AIS), and oversight of education policy and regulations.

Enterprise and Advanced Education is the ministry responsible for advanced education and innovation programs in Alberta, including adult learning, apprenticeship and industry training, and technology innovation. The ministry's adult learning responsibilities include funding education providers, providing financial assistance to students, approving programs of study, and licensing and certifying providers. Apprenticeship and industry training responsibilities for the ministry include developing program standards, funding approved programs, and certifying apprentices and occupational trainees.

The Department of *Health* sets health care policy and standards, implements the policies, and ensures compliance. Alberta Health Services, reporting directly to the minister, oversees the planning and delivery of health supports and services to Albertans.

Human Services is the ministry responsible for providing programs and services related to children and youth (such as adoption, child care and early childhood development, Child Intervention Services, Family and Community Support Services, Family Support for Children with Disabilities, and family violence and bullying prevention), employment and immigration, and homelessness.

Justice and Solicitor General administers the criminal justice system (prosecuting offences under the *Criminal Code*, the *Youth Criminal Justice Act*, and provincial laws), appoints provincial court judges and justices of the peace, is responsible for property and civil law within the province, and is responsible for public security (policing, crime prevention, community awareness, sheriffs, and victim services) and correctional services (for custody and community sentences).

The research data elements that were provided by each ministry are detailed in Appendix II.

STUDY DATA

DATA COLLECTION

No data were collected directly by CYDL for Project One. Rather, secondary data were used, in the form of administrative data from the participating ministries. Administrative data are captured to enable and personalize service provision. In addition to demographic information on individuals, ministries also capture detailed data on services or programs provided (e.g., payments to physicians for services, student enrolment data, classification of categories of income support recipients, identification of the details of a criminal offence charge, etc.).

Administrative data have limitations, as do all types of data. On the other hand, administrative data provide richness that is unprecedented in more traditional types of research. Administrative data used by CYDL were population-based, allowing investigation of virtually all of Alberta's youth. Furthermore, the level of detail collected for administrative purposes can enable in-depth investigation not possible with many other types of data.

Three main types of administrative data were used for the project. Identity Resolution Data (IRD) consisted of demographic data, including names, addresses, and dates of birth; these data elements were used to link youth across ministries. Youth postal codes were used to determine region of residence and socio-economic status for the neighbourhoods in which youth resided. Anonymous Research Data (ARD) consisted of information on the programs and services provided to youth (such as health services, court sentences, maltreatment-related intervention services, post-secondary programs, etc.); these data were used to answer research questions of interest to the ministries.

The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.

- Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
- Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries' data. This resulted in the number of 12 year olds in the study population being lower (approximately 50% lower) than that of 13 to 17 year olds.
- Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.

SOURCE DATABASES

1.1 million IRD records and 4.2 million ARD records were obtained for the project from 13 different ministry databases, as per the table below.

Ministry	Database	Use in this report	IRD source?	ARD source?
Education	Corporate Data Warehouse (CDW)	Primary and secondary education achievement data	No	Yes
Enterprise and Advanced Education	Learner Enrolment Reporting System (LERS)	Post-secondary education enrolment data	No	Yes
Enterprise and Advanced Education	Stakeholder Registry System (SHR)	Post-secondary and K to 12 demographic data	Yes	No
Health	Inpatient – Discharge Abstract Database (DAD)	Hospitalization data	No	Yes
Health	Ambulatory Care (ACCS)	Emergency room visit data	No	Yes
Health	Practitioner Payments (SESE)	Physician visit data	No	Yes
Health	Alberta Health Care Insurance Plan Population Registry (AHCIIP registry)	Population registry	Yes	No
Human Services	Child Youth Information Module (CYIM)	Maltreatment and intervention data	Yes	Yes
Human Services	Family Support for Children with Disabilities Information System (FSCDIS)	Family Supports for Children with Disabilities data	Yes	Yes
Human Services	Central Client Directory (CCD)	Income support data	Yes	Yes
Justice and Solicitor General	Justice Online Information Network (JOIN)	Offence data	Yes	Yes
Justice and Solicitor General	Alberta Community Offender Management System (ACOM)	Corrections data (community supervision)	Yes	Yes
Justice and Solicitor General	Correctional Offender Management Information System (CoMIS)	Corrections data (custody)	Yes	Yes

See Appendix II for details of the data elements extracted for each ministry, and see Appendix III for definitions and notes specific to each ministry.

Education

When a youth enrolls in the K to 12 education system, a record of their enrollment is kept by Education in their Corporate Data Warehouse. Data elements from this database were used to determine a youth's educational achievement, including age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. School authority type was also obtained from this database. Demographic data for the IRD extract came from the Stakeholder Registry System for both Enterprise and Advanced Education and Education

Enterprise and Advanced Education

When students enroll in a post-secondary institution in Alberta, details of the enrollment are stored in the Learner Enrolment Reporting System (LERS). Data elements include demographic data, type of program, academic session (fall, winter, spring or summer), whether the student is enrolled full- or part-time, whether a student has completed the program, institution type, etc. Demographic data for the IRD extract came from the Stakeholder Registry System for both Enterprise and Advanced Education and Education.

Health

When individuals visit a physician, visit an emergency room, or are admitted to hospital, a record of their visit is created, including patient demographics, diagnoses made, services provided, or reasons for visit. The Practitioner Payments database, enabling physician billing, details physician visits. The Ambulatory Care database contains details of emergency room visits, and the Inpatient—Discharge Abstract Database contains information on hospital admissions. Demographic data for the IRD extract for Health came from the Alberta Health Care Insurance Plan stakeholder registry.

Human Services

Child Intervention

When maltreatment of a youth by a parent or guardian is suspected, an investigation may be initiated by Human Services to determine whether the youth is in need of intervention services. In some cases, it may be found that intervention services are not required, and referrals to other services in the community may be made. If the youth is found to be in need of intervention services, there is a range of services that may be provided. Services fall into two main groups: services the youth receives in the home with their parent(s) or guardian(s), and services the youth receives if they need to be removed from their home and placed into care. Data on investigations and intervention services were extracted from the Child and Youth Information Module (CYIM). Demographic data for the IRD extract for Human Services Child Intervention were also from CYIM.

Family Support for Children with Disabilities (FSCD)

FSCD provides parents or guardians with information, referrals, or funding for supports and services to support the growth and development of their children with developmental, physical, sensory, mental or neurological disabilities. The FSCD Information System (FSCDIS) extract provided data on types of support provided as well as disability types. Demographic data for the IRD extract for Human Services FSCD were also from FSCDIS.

Income Support

Income support in Alberta consists of financial support provided to individuals or families who cannot meet their basic needs for a variety of reasons. Support services and employment planning services are provided in addition to financial support. Financial resources, ability to work, and number of dependents determine the amount of financial support provided. An extract from the Central Client Directory (CCD) provided data on income support clients, including their household types (singles or couples, with or without children) and client types (whether they were expected to work or had barriers to full employment). Demographic data for the IRD extract for Human Services Income Support were also from CCD.

Justice and Solicitor General

When a youth is charged by police with committing an offence, the information for the offence and for the youth is entered into the Justice Online Information Network (JOIN). This database includes demographic data, details about the statute (e.g., the Criminal Code) under which the youth was charged, the date of the offence, the date of the charge, the court location, etc. The extract from this database allowed determination of the number of offences a given youth was charged with in the study year. Demographic data for the IRD extract for Justice and Solicitor General offence charges were also from JOIN.

When a youth appears in court, data on the court outcome is stored in one of two databases maintained by Justice and Solicitor General.

- If the court outcome is “pretrial supervision” (the youth is released into the community while awaiting trial) or a sentence to be served in the community (probation or community service), data on the court outcome are stored in the Alberta Community Offender Management System (ACOM). ACOM contains offender demographics, charge information, probation status, conditions of release, offender risk assessments, etc.
- If the court outcome is “remanded into custody” (i.e., the court outcome is to send them to a correctional centre or group home to await trial) or “sentenced to custody” (i.e., the court outcome is to sentence them to a period of time spent in a correctional centre or group home), data on the court outcome is stored in the Correctional Offender Management Information System (CoMIS). CoMIS contains data on offender demographics, admissions, movements, charges, and releases.

Demographic data for the IRD extract for Justice and Solicitor General court outcomes were obtained from both ACOM and CoMIS.

DATA LINKAGE

ANONYMOUS LINKAGE OVERVIEW

In order for the research data for each youth to be collated across the various ministries, an anonymous linkage process was employed (see diagram on following page).

The ministries extracted the relevant data, standardized formatting and content as required, and assigned unique but meaningless identifiers to each record. The extracts were split into identity resolution data (IRD; names, dates of birth, and addresses), anonymous research data (ARD; specific to each ministry), and postal codes, with the same identifiers attached to the IRD, ARD, and postal code for each record.

The IRD were submitted to a one-way hashing process and were sent securely to the Anonymous Identity Resolution System (AIRS). Running the AIRS software on the IRD extracts resulted in a record-linking file. When the software determined that records from different ministries referred to the same youth (based on comparisons of names, dates of birth, and addresses), the identifiers for those records were linked to one another in the record linking file. If a record did not link with any other records, that identifier appeared alone in the record linking file. The record linking file was sent securely to the CYDL.

Postal codes for each youth were submitted to the Hub (in this case, Health). The Hub used a translation file to convert the postal codes to Statistics Canada dissemination areas. The resulting file, containing identifiers and dissemination areas, was sent securely to the CYDL.

The ARD (research data specific to each ministry, with identifiers) were sent securely to the CYDL directly from the ministries.

Using the record linking file from AIRS, the CYDL linked the ARD from all ministries for each youth. A dissemination area was also assigned to each youth using the file provided by the Hub. The CYDL then validated the submitted data and performed analyses to answer research questions.

CYDL Data Linkage Process

THE AIRS PROCESS

The Anonymous Identity Resolution (AIRS) process used software developed by IBM® to determine whether a youth being served by a given ministry was the same youth receiving services from another ministry. To avoid sharing identifying information, ministries anonymized the IRD data elements via a one-way hashing process before submitting the IRD elements and record identifiers to AIRS.

The hashed data were compared by the AIRS software, to determine whether the data provided by different ministries were for the same youth. Names, dates of birth, and addresses were compared to determine whether the individuals were the same person. Some standardization of elements occurred at this stage, so that, for example, *Robert* and *Bob* would be considered the same, as would *80 Avenue* and *80 Ave*.

The record linking file was the output from the AIRS linkage process. This file contained all identifiers from the IRD; the identifiers for those records deemed to be from the same individual were linked in the record linking file.

On the next page is a simplified example of the AIRS process for three youth for Education and three youth from Justice and Solicitor General. One record in Education has the same name, date of birth, and address as a record in Justice and Solicitor General. AIRS generates a record linking file that links the identifiers from these two records. The remaining records were not linked, and their identifiers appear alone in the record linking file.

CYDL received only the record linking file from the AIRS process. The identifiers in the record linking file were the same as those in the ARD and the dissemination area files, allowing the research data and the dissemination area files to be linked across all ministries from which the individuals accessed services.

LINKAGE RULES

The AIRS software used a set of rules to link individuals. In the example above, the name, date of birth and address for the individual were all identical in the IRD from the two ministries. This is the most stringent criterion for a match, but it was not the only possible type of match. In actuality, linkages were possible with less stringent criteria. Below is a table with the three linkage rules used for Project One.

Rule	Description
One	Exact names, exact addresses, exact dates of birth
Two	Close names, exact addresses, exact dates of birth
Three	Close first and middle names and exact last names, exact dates of birth, address not considered

Close name matches were determined by an algorithm that considered various combinations of available names (e.g., if middle name and first name were switched, an exact match would fail but a close match would succeed).

If a match was not found between records with Rule One, Rule Two was tested. Failure to find a match with Rule Two led to comparison of records with Rule Three. If no match was found after Rule Three was applied, those records remained unlinked.

On the other hand, if a match was found with any of the rules, a new “entity” was formed, consisting of all of the elements (identifiers, names, dates of birth, and addresses) for the records that matched. Any subsequent data being evaluated for a match was compared to the entire entity; the rules would consider all instances of names, dates of birth, and addresses within the entity.

A new record could potentially cause two previously separate entities to merge together into a single entity containing the new record and both previous entities. This would occur when a new record shared enough information to match both entities, even though the two entities did not meet the criteria for a match on their own.

LINKAGE VALIDATION

Following the implementation of the AIRS software and generation of the record linking file, a validation process occurred. Overall linkage rates were evaluated for reasonableness, based on known data. Initial linkage rates were not considered acceptable, and the settings for the AIRS process were changed in an iterative fashion. Once a reasonable set of linkage rates was obtained, with rules that made sense given the IRD provided, samples of individual linkages were tested.

Because the submitted records were anonymized, this validation process could not be completed by CYDL. The ministries were given samples of identifiers from both matched and unmatched records. They were asked to look at the records associated with those identifiers in their original (non-anonymized) extracts to determine whether the matches and non-matches were correct. There were four possible outcomes from these evaluations, as seen in the table below.

	Resolver Match	Resolver Non-Match
Ministry Match	True match	False non-match
Ministry Non-match	False match	True non-match

The higher the proportion of true matches (i.e., cases in which the resolver matched records that the ministries agreed were indeed the same individuals) and true non-matches (i.e., cases in which the resolver did not match records that the ministries agreed were not the same individuals), the better the linkages. Significant proportions of false matches and false non-matches are not desirable.

The proportions of false matches found by the ministries were not minimal but were not overly high. This finding allowed CYDL researchers and the relevant working groups and committees to conclude that, while some specific linkage issues were identified (see below), the linkage process was valid and analysis of the research data could proceed.

Issue	Description
Addresses	Addresses had to begin with a number to be included in matching (e.g., "Rural route #1" was not included)
Siblings/twins	Many of the false matches found by the ministries were siblings or twins
Initials	There was some indication that false non-matches were more common when first names were initials only
Hyphens	There was some indication that false non-matches were more common when names were hyphenated
Ethnicity	There was some indication that false non-matches had a higher proportion of names of non-Anglo Saxon origin
Multiple names	There was some indication that false non-matches had a higher proportion of youth with multiple names

Educ= K to 12 Education enrolment (12 to 20 years)

EAE= Enterprise and Advanced Education enrolment (12 to 24 years, most over 17)

CI1 = Human Services Child Intervention investigations (12 to 18 years)

CI2 = Human Services Child Intervention interventions (12 to 22 years)

FSCD = Family Support for Children with Disabilities (12 to 18 years)

IS = Income support (18 to 24 years)

JSG = Justice and Solicitor General offence charges (12 to 17 years)

ACOM = Alberta Community Offender Management (Justice and Solicitor General youth in community service) (12 to 17 years)

CoMIS = Correctional Management Information System (Justice and Solicitor General youth in custody) (12 to 17 years)

AHCIP = Alberta Health Care Insurance Plan registry (12 to 24 years)

LINKAGE RATE INTERPRETATION

There are two tables above; the top table contains percentages and the bottom contains counts.

The columns in the linkage rate tables are source datasets, which were linked to the datasets appearing in the rows (the linked datasets). For example, 3.6% (262) of the 7,311 CY1 entities matched to FSCD entities, and 72.0% (5,263) matched to Education entities. *Reminder: Entities represent individuals as determined by the AIRS software. An entity consists of one or more records, all of which have been deemed to represent the same youth.*

The “No match” row refers to entities for a given dataset that did not link to any other datasets.

Dashes represent suppressed data, when fewer than 10 entities occurred.

The diagonal (in bold) represents “internal matches”, with records in a given database linking to other records in the same database (representing a mixture of false positive matches due to linkage errors or data errors, and true positives, in which a youth actually had duplicated data in the ministry database). The internal match rates were calculated as the number of records that were incorporated into other entities, out of the total number of records in a database. The internal match rates are under 1.5%, with the exception of the data on offence charges from Justice and Solicitor General (3.6%). The presence of duplicated records for the same youth is a known issue in this database.

Age groups of youth receiving services must be kept in mind when interpreting linkage rates. For example, just 8.4% of youth receiving income support were linked to youth in the K to 12 education system. Income support data were for 18 to 24 year olds, while 12 to 20 year olds were included in the Education data, so the low linkage rate is expected because of low overlap in populations.

The last row of the tables contains data on linkages to the Alberta Health Care Insurance Plan (AHCIP) registry, which includes all youth in Alberta with a health care number (close to the total population of youth). Linkage rates to this database were expected to be high, and they generally are. A notable exception is Enterprise and Advanced Education students, many of whom are from out of province and would not be expected to be in the registry. As well, only 71.7% of income support clients were linked to the registry, perhaps reflecting the more transient nature of this population.

Database-specific summaries of linkage rates

See the Source Databases section for descriptions of sources and content of databases.

Education students (Educ column)

K to 12 education students included 12 to 20 year olds (this is the second column in the tables). 2% or fewer of the youth enrolled in the education system received services from Human Services Child Intervention and FSCD, overlap with the advanced education system and income support was low (largely due to low overlap in age groups served), involvement in the justice and corrections systems was low, and registration in the AHCIP was high. Nevertheless, given the large Education population, there were more than 5,000 youth in the education system who were involved with Human Services Child Intervention, 3,170 receiving FSCD services, 4,620 in the justice system, and more than 4,000 involved in corrections.

Advanced education students (EAE column)

The first column contains the linkage rates for students enrolled in advanced education programs. Due to their ages (up to 24, but mostly over 17) and the higher proportion of youth from out of province, this population low rates of overlap with many of the other youth populations. There was a substantial population of youth (2,486 youth, or 2.0% of the advanced education population) who were enrolled in the K to 12 system and the post-secondary system in the same school year, and 0.3% of youth in advanced education were receiving income support. The linkage rate to the AHCIP registry was lower than most ministries, as discussed above, likely due to high numbers of out-of-province students.

Human Services Child Intervention clients (CI1 and CI2 columns)

The third and fourth columns are the linkage rates for Child Intervention investigations for maltreatment (CI1; 12 to 18 year olds) and interventions for maltreatment (CI2; 12 to 22 year olds; see Data These two populations have high rates of overlap with one another (an investigation often leads to an intervention), fairly high rates of enrolment in the K to 12 education system, and high rates of involvement in the justice system (12 or 13% of youth) and the corrections system (3 to 4% in custody and 9 to 11% in community service). Rates of linkage to the AHCIP registry were high, particularly for the interventions group.

Human Services Family Support for Children with Disabilities clients (FSCD column)

The fifth column represents the population of youth 12 to 18 years old receiving services from FSCD. This population shows moderate overlap with the Human Services Child Intervention investigations and interventions populations, the highest linkage rate to Education (many youth are referred from the Education system to FSCD and youth in the program are expected to attend school), some overlap with the income support population (this would be 18 year olds only), low involvement in the justice or corrections systems, and the highest linkage rate to the AHCIP registry (many FSCD clients have ongoing health concerns and as such would be less likely than others not to be registered with AHCIP).

Human Services Income Support Clients (IS column)

Youth receiving income support (18 to 24 years) generally had low rates of linkage with other ministries, again largely due to their ages. Of income support clients, 8.4% were enrolled in the K to 12 system (presumably, many of these youth were upgrading high school) and 5.8% were enrolled in the post-secondary system.

Youth charged with offences (JSG column) and Youth in community supervision (ACOM column)

Youth charged with offences (12 to 17 years; JSG column) had linkage patterns that were very similar to youth in community supervision corrections programs (12 to 17 years; ACOM column); the overlap between the two populations was, as expected, large. Enrolment in the K to 12 education system was fairly high (73.2% of youth charged with offences and 77.5% of youth in community supervision). Youth receiving investigations or interventions for maltreatment were over-represented in both of these populations, with maltreatment-related interventions being provided to 16.4% of youth in the justice system and 16.6% of youth in community supervision. Linkage rates to advanced education and FSCD were low, while linkage rates to the ACHIP registry were high.

Youth in custody (CoMIS column)

Youth in custody in the corrections system (12 to 17 years; CoMIS column) followed a similar but more extreme pattern than youth in community service, with only 69.7% of youth in custody enrolled in the K to 12 education system, and fully 35.3% of youth in custody receiving maltreatment-related interventions. The rate of linkage to the ACHIP registry was higher (91.4%) than for youth in the justice system or community service.

Youth in the Alberta Health Care Insurance Plan registry (AHCIP column)

There were 655,867 youth in the AHCIP registry, many more than received services from the other ministries participating in the project. The only sizeable linkage rates for this population, as expected, were to the other two large populations in the project (students enrolled in the K to 12 and post-secondary education systems). Almost half (48.6%) of youth in the AHCIP registry were not linked to youth in any other ministry, in large part due to the fact that many ministries provided services to youth under 18, while youth in registry extract were up to 24 years of age and therefore did not use services provided by other ministries. Note, of course, that most of the unlinked youth in the AHCIP did use health services.

METHODOLOGY AND LIMITATIONS

DATA CLEANING AND DERIVATION OF INDICATORS

Data manipulations prior to analysis

- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries (which occurred in less than 0.05% of cases), the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from among the most common values.
 - For example, Justice and Solicitor General may have provided 17 years as the age of a particular youth, Education 16 years, and FSCD 16 years. In this case, 16 years would have been assigned to that youth (as the single most common value). If Child Intervention had contributed an age of 17 years as well, there would have been two most common values (16 and 17) and one would have been randomly assigned to that youth.
 - Very rarely, application of this algorithm resulted in assigning an age to a youth that was out of the age range for services provided by that ministry (e.g., a youth charged with an offence might have been assigned an age of 18 years, while the possible age range is 12 to 17). If this occurred, the individual was removed from the analysis.
 - In a few cases, application of this algorithm resulted in male gender being assigned to individuals receiving health services that were not possible for males (i.e., obstetrics and gynecology). This was noted in the relevant report when it occurred.
- Enterprise and Advanced Education provided data on all post-secondary academic sessions in which youth were enrolled in the study year. When a student was enrolled in more than one session in the study year, one session was chosen to provide values for credential type, enrolment status, and institution type for that individual.
 - Full-time enrolments were chosen over part-time, winter session enrolments were chosen over fall sessions, and fall sessions were chosen over spring and summer enrolments. If only spring or summer enrolments occurred, the session was randomly chosen from among the spring and summer enrolments.

Derivation of data elements

- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000. All other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided¹. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In many reports, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile. Other reports included all five quintiles.
 - Socio-economic status may be missing for a youth for a number of reasons (a postal code was not provided, the postal code was not associated with an Albertan dissemination area, or the socio-economic status index was unavailable for the dissemination area).
- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)². Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.

STUDY POPULATION

A total of 1,091,813 IRD records from 10 datasets were submitted to the AIRS process by the participating ministries.

Once the AIRS process completed and youth were matched across ministries, a total of 713,830 entities resulted. In other words, of the 1,091,813 original records, 377,983 records were considered matches to other records and were added to entities, resulting in the 713,830 final entities that comprised our data set (the number of entities by ministry is in the top row of the linkage rate tables. Note that the total across ministries is larger than 713,830 because some of the entities include youth who received services from two or more ministries).

There were 655,867 entities in the AHCIP registry extract for Project One (57,963 fewer than the total number of entities in the project). The AHCIP registry is often used to estimate population in Alberta because health care provision is universal in the province. However, some youth are not registered, in particular those new to the province, temporary residents, and transient populations.

The AHCIP registry excludes youth who have not been permanent residents for at least six months, members of the Canadian Armed Forces or the Royal Canadian Mounted Police, and federal penitentiary inmates. The Project One population includes these youth; the largest subpopulation of youth captured in Project One who would not be in the AHCIP registry are post-secondary students whose permanent address is outside Alberta (there were 28,282 youth in the Enterprise and Advanced Education extract who did not match to the AHCIP registry). There would also be youth in our database who were members of the Armed Forces or the RCMP or were federal inmates.

There were a further 26,367 youth enrolled in the K to 12 education system who were not linked to the AHCIP registry. Youth who are new to the province and were not yet registered in AHCIP would be expected to be the majority of this group.

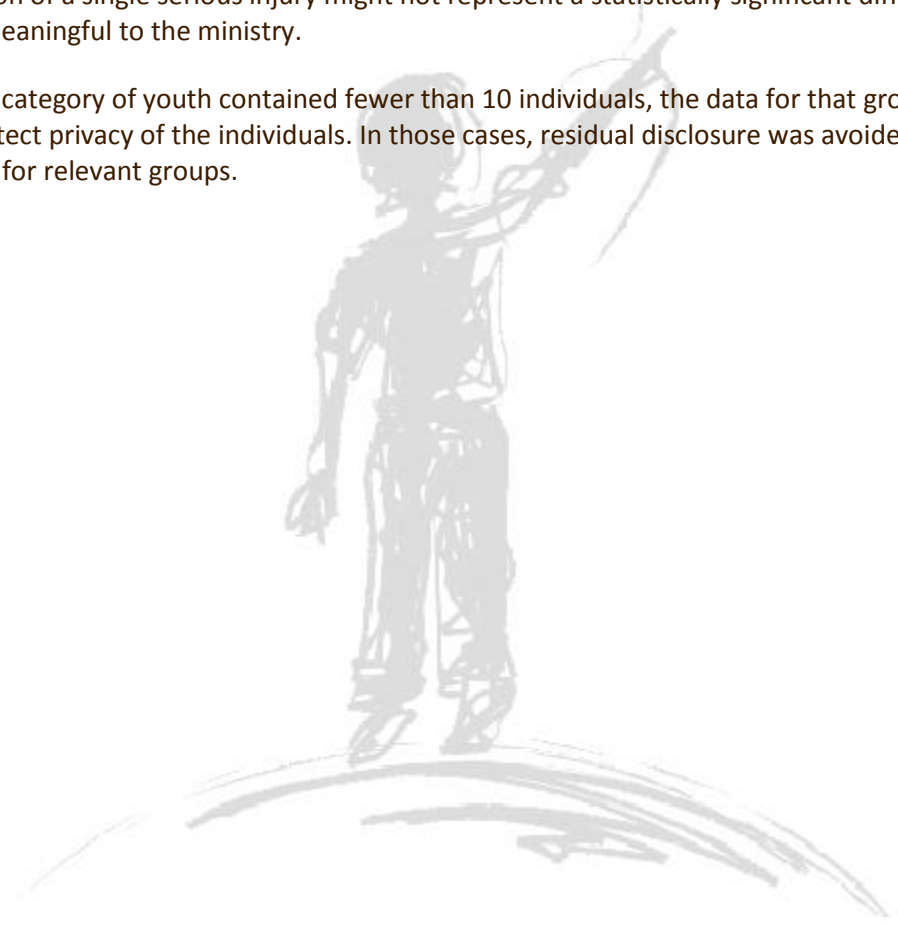

Failed linkages due to incorrect IRD or linkage software issues are expected to have resulted in the exclusion of a small but unknown number of Albertan youth.

ANALYSES

The central goal of Project One was to provide a comprehensive description of the experiences of Albertan youth in a single year. As such, the analyses were descriptive, with no testing of pre-defined theories. For the most part, analyses consisted of cross-tabulations of sub-populations of interest, with results expressed as percentages of a given population. Where appropriate, comparisons were made to complementary populations.

Significance testing of differences was not carried out. Our dataset was population-based, negating the need for significance testing due to the absence of sampling error. Furthermore, the criterion for meaningfulness was policy relevance: regardless of the statistical significance of a finding, ministries would be expected to develop policy based on whether the differences were meaningful to the ministry. For example, a ministry may be interested in preventing every instance of serious injury among the youth it serves. Prevention of a single serious injury might not represent a statistically significant difference, but it may in fact be meaningful to the ministry.

In all analyses, if a category of youth contained fewer than 10 individuals, the data for that group were suppressed to protect privacy of the individuals. In those cases, residual disclosure was avoided by suppressing totals for relevant groups.

DATA LIMITATIONS

Administrative data limitations

Administrative data are not collected for research purposes; this means that their use for research purposes comes with some caveats.

Constructs useful for research purposes must be derived from indicators captured in administrative data and are therefore only proxies for the underlying constructs.

There is variation in data collection policies and procedures across ministries. Possible sources of error include coverage errors (a ministry may fail to populate a record for a service provided), non-response errors (in which data are not available for a service), response errors (in which incorrect data are provided for a service), or processing errors (in which ministries make errors when recoding, for example, in assigning codes to written descriptions of events).

Ministry-level validation of administrative data will vary across indicators, and will be dependent on administrative need for validation rather than on research need for accuracy and completeness.

Linkage limitations

Analysis resulting from the linkage process must be interpreted with the understanding that some false matches (both positive and negative) will occur in the data, although false matches are thought to be relatively rare. A summary of known issues is discussed in the Linkage Validation section of this report. The linkage validation process led to the conclusion that there is a tendency for under-representation of the following youth in the linked dataset: rural youth, twins, youth with initials as first names, youth with hyphenated names, youth with some types of last names of non-Anglo Saxon origin, and youth with multiple names. The pattern of linkage rates indicates that these problems are fairly limited in nature.

An analysis comparing key indicators of youth who were matched across at least two IRD databases with youth who were not matched with any other IRD databases was conducted. These “matched” and “unmatched” youth did not differ substantially in terms of gender, Aboriginal status, region of residence, educational achievement, or presence of a mental health condition. There were more unmatched youth in the older age groups (name and address changes were likely more common in older youth). There was also a tendency for the two lowest socio-economic status quintiles to have higher rates of unmatched youth, in particular the low-middle SES group (address changes may be more common in lower socio-economic status groups).

General limitations

The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.

- Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
- Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries' data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
- Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.

Some ministry service uses tend to be brief, and others are more long-term. As such, services received in the study year were not necessarily simultaneous. For example, youth who were hospitalized and in custody (corrections), may or may not have been so at the same time.

Only youth with a value for a given indicator were included in analyses involving that indicator (i.e., missing values were excluded).

Errors discovered in the data were excluded from analyses (following communications with ministries).

For research data notes specific to ministries, see Appendix III

APPENDICES

APPENDIX I CYDL Project One Governance

Committee or Group	Description
Deputy Ministers Committee	Prioritizes evidence needs for policy, approves final report.
Assistant Deputy Ministers Committee	Identifies the research agenda.
Coordinating Committee	Contributes to research question development and research product dissemination plan.
Research Working Group	Contributes to research question development, identification of desired data elements, development of data workbook outlines, feasibility analysis, and validation of data and analyses. Reviews final report.
Data/Technical Working Group	Contributes to feasibility analysis, development of final data elements and workbooks, carries out data extraction and submission to the Hub and CYDL.
Legal/Privacy Working Group	Considers legal and privacy issues in data workbooks, completes privacy impact assessment and information sharing agreements, performs disclosure assessment.
Hub	Translation of postal codes to dissemination areas, operation of identity resolution software, transfer of dissemination area files and record linking file to CYDL.
Child and Youth Data Lab (CYDL)	Facilitates research question development and identification of data elements, leads feasibility analysis, develops data workbooks, completes ethics board submission, facilitates data extraction and submission and data linkage process, links research data, analyzes research data, generates reports and other research products, participates in research product dissemination.

APPENDIX II CYDL Project One Data Elements

Source	Indicator	Description
Education	Age	Age in years and months
	Gender	Female or male
	Dissemination area	Area of residence
	Educational achievement	Educational performance relative to grade and age
	School authority type	Type of primary or secondary school attended (public, private, separate, charter, Francophone, other)
	Age	Age in years and months
	Gender	Female, male, or unknown
	Dissemination area	Area of residence at time of application, and for current residence
	Institution attended	Post-secondary institution attended. Grouped into: Baccalaureate and Applied Studies Institutions, Comprehensive Academic and Research Institutions, Comprehensive Community Institutions, Independent Academic Institutions, Polytechnical Institutions, Specialized Arts and Culture Institutions.
	Credential type	Type of credential student is working towards. Grouped into: Bachelor/Applied/Graduate Level Program, Certificate/Diploma Program, Not Applicable (No credential)
Enterprise and Advanced Education	Enrolment status	Full- or part-time status
	Session enrolled	Session enrolled (fall, winter, spring, summer)
	Parchment received	Whether the parchment for the program was received. Grouped into: yes, no, or non-parchment program.
	Age	Age in years and months
	Gender	Female or male
	Dissemination area	Area of residence
	Mental health status	Mental health-related service use (physician claims, hospitalizations, emergency departments). Categorized as neurodevelopmental, psychiatric, affective, behavioural, or none.
	Physician visits	For each visit to a physician, provider type (general practitioner or specialist), scrambled provider code, and date of visit were provided. Provider code and date of visit were used to calculate unique doctor/day visits. For mental health-related visits, reason for visit was provided.
	Emergency room visits	For each visit to an emergency room, the primary reason for the visit was provided. For mental health-related visits, all reasons for visit were provided.
	Hospitalizations	For each hospitalization, the primary service code for the visit and the length of stay were provided. For mental health-related visits, all service codes were provided.
Human Services (Child Intervention investigations)	Age	Age in years and months
	Gender	Female or male
	Dissemination area	Area of residence at the time of intervention, and at the time of placement (if in care).
	Aboriginal status	Aboriginal status (Aboriginal or not).
	Result of assessment/investigation	Outcome of maltreatment-related investigation (in care, not in care, no intervention needed)
	Age	Age in years and months
Human Services (Child Intervention interventions)	Gender	Female or male
	Dissemination area	Area of residence at the time of intervention, and at the time of placement (if in care).
	Aboriginal status	Aboriginal status (Aboriginal or not).
	Type of service	Type of intervention service provided (in care, not in care)

APPENDIX II CYDL Project One Data Elements continued

Source	Indicator	Description
Human Services (FSCD)	Age	Age in years and months
	Gender	Female or male
	Dissemination area	Area of residence
	Mental health status	Mental health diagnosis category (neurodevelopmental, psychiatric, affective, behavioural, none).
	Child category	Highest level of service provided in the most recent service agreement (out of home placement, specialized services, child-focused services, family-focused services, unclassified)
	Primary disability	Medical diagnosis for primary disability (autism-spectrum disorders, other developmental conditions, physical/motor conditions, mental health disorders, sensory impairments, health conditions, unconfirmed conditions)
	Secondary disability	Medical diagnosis for secondary disability (same categories as above)
	Tertiary disability	Medical diagnosis for tertiary disability (same categories as above)
	Age	Age in years and months
	Gender	Female or male
Human Services (Income Support)	Dissemination area	Area of residence
	Client type	Expectation for future labour force participation for head of household (expected to work, barriers to full employment, or not applicable)
	Household type	Household type (single without children, single parent with children, couple without children, couple with children)
	Age	Age in years and months
	Gender	Female or male
Justice and Solicitor General (offence charges)	Dissemination area	Area of residence
	Offence statute	Youth Criminal Justice Act, Part of the Criminal code, other statute
	Age	Age in years and months
Justice and Solicitor General (corrections)	Gender	Female or male
	Dissemination area	Area of residence
	Aboriginal identity	Aboriginal identity (Aboriginal or not)
	Type of service	Outcome of court procedure (custody or remand, community supervision or pretrial supervision)

APPENDIX III Research data notes specific to ministries

Education

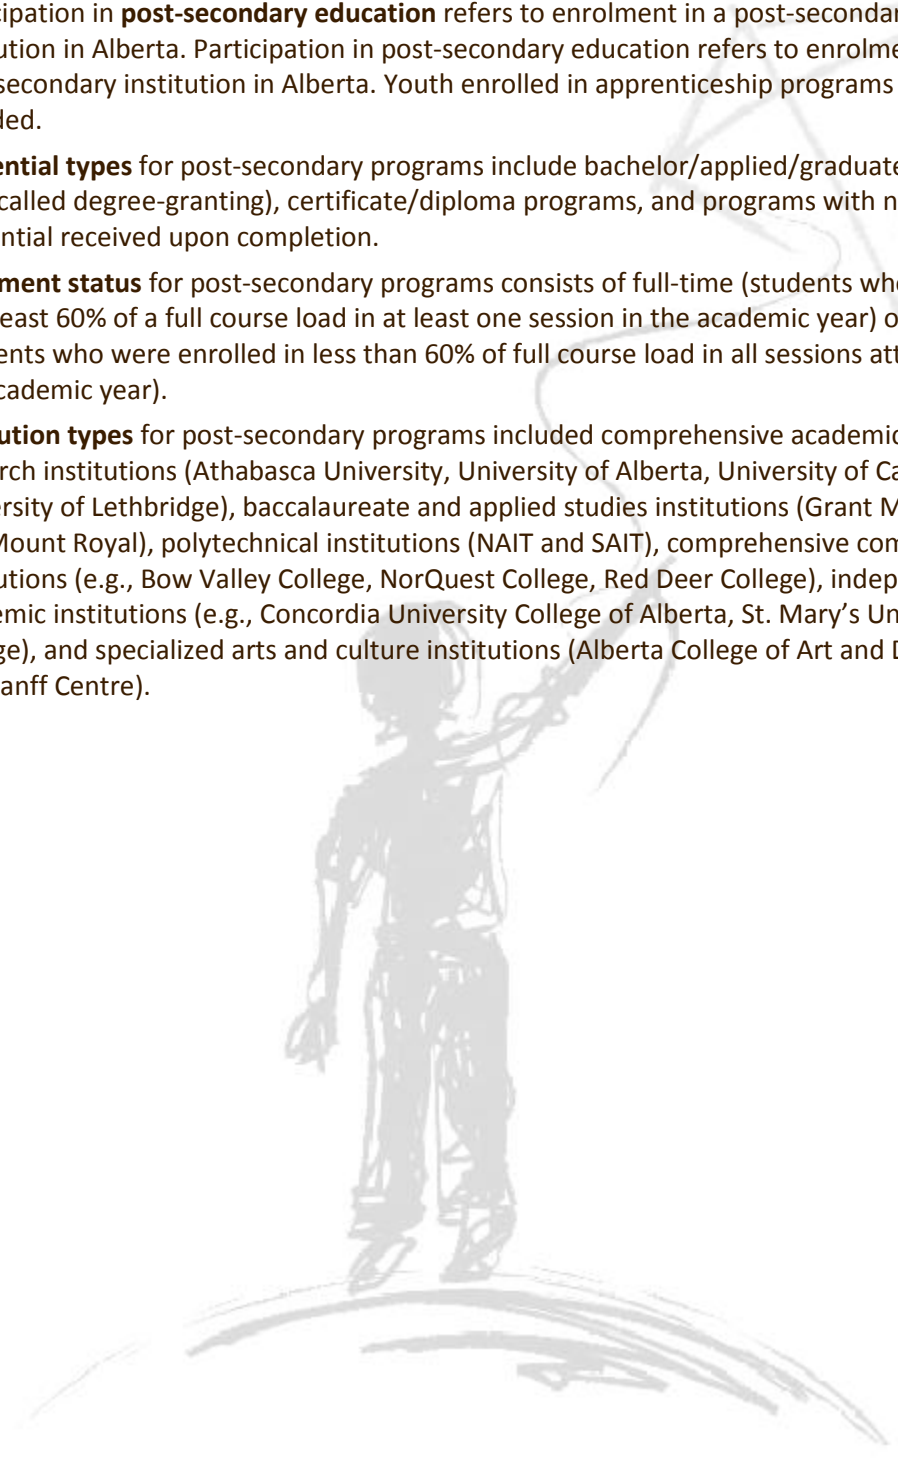

- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- **Educational achievement** was computed by Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student's age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in 'other' schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

School authority types

- There is one publicly-funded system of education in Alberta. The public system includes public, separate, Francophone and charter schools.
 - **Public** schools are non-denominational schools.
 - **Separate** schools are established under rights guaranteed by the Constitution of Canada for the minority religion (Protestant or Roman Catholic).
 - **Francophone** schools provide instruction in French to children whose parents have rights under section 23 of the Canadian Charter of Rights and Freedoms.
 - **Charter** schools are autonomous public schools designed to meet the needs of students through a specific program or approach. They must be non-religious.
- **Private** schools operate outside the public education system. Private schools may charge tuition and other fees. There are two kinds of private schools.
 - Accredited private schools must offer the Alberta Program of Studies with certificated teachers; they may be partially funded or non-funded.
 - Registered private schools are not required to offer the Program of Studies and are not funded.
- **Other** schools are accredited post-secondary institutions offering high school courses for credit to adults.

Enterprise and Advanced Education

- Participation in **post-secondary education** refers to enrolment in a post-secondary institution in Alberta. Participation in post-secondary education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Credential types** for post-secondary programs include bachelor/applied/graduate programs (also called degree-granting), certificate/diploma programs, and programs with no credential received upon completion.
- **Enrolment status** for post-secondary programs consists of full-time (students who enrolled in at least 60% of a full course load in at least one session in the academic year) or part-time (students who were enrolled in less than 60% of full course load in all sessions attended for the academic year).
- **Institution types** for post-secondary programs included comprehensive academic and research institutions (Athabasca University, University of Alberta, University of Calgary, University of Lethbridge), baccalaureate and applied studies institutions (Grant MacEwan and Mount Royal), polytechnical institutions (NAIT and SAIT), comprehensive community institutions (e.g., Bow Valley College, NorQuest College, Red Deer College), independent academic institutions (e.g., Concordia University College of Alberta, St. Mary's University College), and specialized arts and culture institutions (Alberta College of Art and Design and The Banff Centre).

Health

- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** (AHCIP) coverage to receive insured health services.
- Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province.
- Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- **Physician visits** reflect fee claims made by physicians for services provided when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment. **Reason for emergency room visit** was based on the primary diagnostic code given for each visit. Categories of reasons included *injury/poisoning* (ICD-10-CA¹ Chapter XIX Injury, poisoning and certain other consequences of external causes), *respiratory* (Chapter X Diseases of the respiratory system), *influencing factors* (Chapter XXI Factors influencing health status and contact with health services), *symptoms/signs* (Chapter XVIII Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified), and *other* (all other ICD-10-CA chapters).
- **Hospitalizations** refer to admissions to hospital for assessment or treatment. **Hospital service type** was defined by the main patient service code (the patient service that contributes to the longest portion of a patient's stay; see the Canadian Institute for Health Information's DAD Abstracting Manual² for codes). Categories of services were labelled *general medicine* (patient service codes 01 to 29, 55, 56, 58, 60 to 63, 66 to 76, 82, 91, 96, 99), *surgery/procedure* (patient service codes 30 to 49, 81, 87), *psychiatry* (patient service codes 64, 65), or *pregnancy-related* (patient service codes 51 to 54, 59).

1. Canadian Institute for Health Information (2001). *International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Canada*. CIHI: Ottawa.
2. Canadian Institute for Health Information (2006). *DAD Abstracting Manual All Provinces Information 2006-2007 Edition*. CIHI: Ottawa.

Human Services Child Intervention

- **Maltreatment-related investigations** occur when there is a concern that the safety or well-being of a youth is threatened. Outcomes of investigation include in care after investigation (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), out of care services (the youth remains in the home and the family receives support services), and no intervention needed. Youth self-identified or were identified by a parent or guardian as Aboriginal or non-Aboriginal.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include in care services (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and out of care services (the youth remains in the home and the family receives support services). Youth self-identified or were identified by a parent or guardian as Aboriginal or non-Aboriginal.

Human Services Family Support for Children with Disabilities

- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs. In addition to information, referral and advocacy, services and supports may include:
 - **Family Support Services** may include assistance with counseling, extraordinary clothing and footwear costs, costs to attend medical appointments and respite.
 - **Child-Focused Services** are provided when a child has a confirmed diagnosis and assessment information to specify their individual needs. These services include respite services, aide supports, child care supports, and health-related supports.
 - **Specialized Services** are available for children with severe disabilities and/or multiple needs. A Multi-Disciplinary Team is part of the review of complex cases and assists in determining services that are appropriate to the health and developmental needs of the child.
 - **Out of Home Services** provide long-term living arrangements and short-term relief care to accommodate the needs of severely disabled, medically fragile children and their families.
- For the purposes of analysis, families were grouped according to the highest level of service received. For instance, all families that received Out of Home Services were counted in the Out of Home Group regardless of any other services they received. Similarly, only families who did not receive other Child Focused, Specialized or Out-of Home services were included in the Family Support Group.

Human Services Income Support

- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.
- The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).
- **Household types** include singles (one adult in the household) with or without children, and couples (two adults in the household) with or without children.

Justice and Solicitor General

- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- Youth involved in corrections self-identified as Aboriginal or non-Aboriginal.
- Youth involved in corrections may have received educational programs from a school authority that was different from the school authority type they attended while not involved in the correctional system. The school authority assigned to the youth involved in corrections may or may not have been the school authority type in which they were enrolled while involved in corrections.

Socio-economic status of Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report is an overview of the socio-economic status of 680,043 Albertan youth in 2008/09. Pampalon et al.'s neighbourhood deprivation index¹ was used to determine the social and material environments in which youth lived. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single parent families, percent of persons living alone, and percent of persons separated, divorced, or widowed.

The report contains analyses of the relationships between socio-economic status and age, gender, region of residence, educational achievement, mental health status, health service use, and interactions with Enterprise and Advanced Education, Human Services, and Justice and Solicitor General.

- The most socio-economically advantaged environments were experienced more often by youth who were younger, living in large urban centres, or achieving above educational expectations. Youth who pursued a post-secondary education were also more likely to live in higher socio-economic status neighbourhoods. The most socio-economically advantaged youth were less likely to visit emergency rooms or be hospitalized than youth living in the lowest socio-economic neighbourhoods.
- Youth facing challenges, such as receiving maltreatment-related intervention services, receiving Family Support for Children with Disabilities services, being charged with an offence, being involved with corrections, or receiving income support, were more likely to be living in low socio-economic neighbourhoods than youth not facing these challenges.

Socio-economic status of Albertan youth

Context

Due to increased access to resources, materials and experiences, high socio-economic status youth, in general, have better health, educational, and behavioural outcomes than low socio-economic status youth.² Furthermore, neighbourhoods impact individuals; independent of individual or family health, education and income levels, youth in poorer neighbourhoods tend to have poorer outcomes than those in more advantaged neighbourhoods.³

According to the Public Health Agency of Canada, increments in socio-economic status are associated with increments in health status⁴. Lower socio-economic status groups have health disparities with the rest of the population,⁵ whereas higher socio-economic status groups have greater self-perceived health than the rest of the population.³ Additionally, overall health service use is higher in low socio-economic groups,⁵ while use of preventative services is more likely in higher socio-economic groups.³

In addition to differences in health outcomes, previous research has shown that socio-economic status is associated with educational achievement, risk of maltreatment and corrections involvement. Low socio-economic status has been associated with lower grades and more school absences.⁵ Youth from low income families are also less likely to attend university than those from high income families.⁶ Approximately one third of substantiated child maltreatment investigations are from households receiving some form of social assistance.⁷ Youth with higher socio-economic status are less likely to have corrections service involvement.⁸

Despite the negative impacts of living in high-risk neighbourhoods, youth may experience positive outcomes (such as higher levels of academic performance) if they can form a bond with family and teachers, engage in extra-curricular activities, and experience fewer adverse life events.⁹

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth

Educational experiences of Albertan youth

Mental health status of Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Maltreatment-related investigations among Albertan youth

Maltreatment-related intervention services received by Albertan youth

Physician visits by Albertan youth

Emergency room visits by Albertan youth

Hospitalizations of Albertan youth

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Socio-economic status of Albertan youth

Socio-economic status (Table 1)

This analysis considers the socio-economic status of youth (aged 12 to 24 years). Socio-economic status captures the social and material environments in which youth lived.

- 23% of Albertan youth lived in the most materially and socially deprived neighbourhoods; 20% lived in the most privileged socio-economic neighbourhoods.
- The *low middle* and *high middle* bars are slightly below the quintile mark, while the *lowest SES* and *highest SES* bars are slightly above the quintile mark. This is mainly because the original index quintiles were based on the total Albertan population; the study population represents only Albertan youth (aged 12 to 24 years).

Socio-economic status (SES) of Albertan youth aged 12 to 24

Socio-economic status (SES) by age Albertan youth aged 12 to 24

Age (Table 2)

- Between the ages of 12 and 24, the percentages of youth living in the lowest and highest socio-economic status neighbourhoods were similar. Across all ages, about 1 in 5 youth were consistently represented in each of these extreme ends of the socio-economic spectrum.
- The percentage of youth living in *middle* socio-economic status neighbourhoods decreased slightly with age. Movement from the middle to low-middle range increased as youth got older, perhaps indicating a period of lower social and material status for youth transitioning into adulthood.

Gender (Table 3)

- Socio-economic status was similar for males and females. Approximately 20% of males and females were represented in both the lowest and highest socio-economic status neighbourhoods.

Socio-economic status (SES) by gender Albertan youth aged 12 to 24

Socio-economic status of Albertan youth

Socio-economic status (SES) by region of residence
Albertan youth aged 12 to 24

Region of residence (Table 4)

- Among youth living in rural regions, 62% were residing in the two lowest socio-economic status groups, compared to 37% of youth in mid-sized centres and 32% of youth living in large centres.
- Among youth living in the large centres of Edmonton and Calgary, 44% of youth were residing in the two most advantaged socio-economic status groups, compared to 16% of youth living in rural regions.

Educational achievement (Table 5)

This analysis considers youth (aged 12 to 20 years) who were registered in Alberta's K-12 education system in 2008/09.

- Living in more advantaged socio-economic status neighbourhoods was associated with better educational performance.
- Among students achieving above expectations in school, 31% were living in the most materially and socially advantaged neighbourhoods, compared to considerably fewer youth (16%) in the lowest socio-economic status neighbourhoods.

Socio-economic status (SES) by educational achievement
Albertan youth aged 12 to 20

Socio-economic status (SES) by mental health status
Albertan youth aged 12 to 24

Mental health status (Table 6)

This analysis considers youth (aged 12 to 24 years) with a mental health condition in 2008/09. Mental health status refers to the presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.17).

- The socio-economic distribution of youth who had a mental health condition did not differ greatly from youth who did not.

Socio-economic status of Albertan youth

Health service use (Table 7)

- Among youth visiting emergency rooms, 27% were living in the most socio-economically deprived neighbourhoods, compared to 17% of youth living in the most privileged neighbourhoods.
- Among youth who were hospitalized, 28% were living in the lowest socio-economic status neighbourhoods, compared to 16% living in the highest.
- Frequency of physician visits varied little by socio-economic status.

Socio-economic status (SES) by health service use
Albertan youth aged 12 to 24

Socio-economic status (SES) by post-secondary participation status,
Albertan youth aged 17 to 24

Post-secondary participation status (Table 8)

This analysis considers youth (aged 17 to 24 years) participating in the post-secondary education system in 2008/09.

- In general, youth living in the higher socio-economic status neighbourhoods were more likely to be enrolled in post-secondary institutions than youth not enrolled.
- Among youth participating in the post-secondary education system, 27% were living in the highest socio-economic status neighbourhoods, compared with 18% in the lowest.

Maltreatment-related investigation outcome (Table 9)

This analysis considers the socio-economic status of youth (aged 12 to 17 years) who were the subject of a maltreatment-related investigation by Human Services in 2008/09. A maltreatment-related investigation occurs when there is a concern that the safety and well-being of a youth is threatened. See *Definitions and Notes* (p. 17).

- Regardless of the outcome, the socio-economic status of youth who were the subject of a maltreatment-related investigation was considerably lower than youth who were not investigated.

Socio-economic status (SES) by maltreatment investigation outcome
Albertan youth aged 12 to 17

Socio-economic status of Albertan youth

SES prior to and after maltreatment-related intervention (Tables 10 and 11)

This analysis considers youth (aged 12 to 22 years) who received a maltreatment-related intervention in 2008/09. Maltreatment-related interventions occur when the safety or well-being of a youth is threatened.

- The socio-economic status of youth who received a maltreatment-related intervention service did not vary greatly prior to and after intervention.
- Prior to and after an intervention service was received, more than 40% of these youth were living in the most socially and materially deprived neighbourhoods, compared to 23% of youth with no intervention.

Socio-economic status (SES) of youth who received services from Family Support for Children with Disabilities
Albertan youth aged 12 to 18

Family Support for Children with Disabilities (Table 12)

This analysis considers the socio-economic status of youth (aged 12 to 18 years) who received services from Family Support for Children with Disabilities (FSCD) in 2008/09.

- The socio-economic status of youth who received services from FSCD was slightly different from those who did not receive such services, mainly in the low middle and middle quintiles.

Socio-economic status of Albertan youth

Number of charges (Table 13)

This analysis considers youth (aged 12 to 17 years) who were charged with an offence in 2008/09.

- Among youth who had four or more charges, 41% were living in the lowest socio-economic status neighbourhoods. This group was the least privileged materially and socially compared to youth receiving fewer or no charges.

Socio-economic status (SES) by number of charges
Albertan youth aged 12 to 17

Socio-economic status (SES) by type of corrections involvement
Albertan youth aged 12 to 17

Type of corrections involvement (Table 14)

This analysis considers the socio-economic status of youth (aged 12 to 17 years) who were in custody (in which a sentence is served in a young offender facility) or with a community sentence or pre-trial supervision in 2008/09.

- 44% of youth in custody, 36% of youth with a community sentence or pre-trial supervision, and 23% of youth not involved in corrections were living in the lowest socio-economic status neighbourhoods; 7%, 12%, and 21% of these groups of youth, respectively, were living in the highest socio-economic status areas.

Any income support activity and client type (Table 15)

This analysis considers the socio-economic status of youth (aged 12 to 17 years) with any income support activity from Human Services during 2008/09. Client types include *expected to work* (clients looking for work or unable to work in the short term) and *barriers to full employment* (clients having difficulty finding work due to disabilities or other barriers).

- Whether they were *expected to work* or experienced *barriers to full employment*, youth with any income support activity were more socio-economically disadvantaged than the general population of same age youth.

Socio-economic status (SES) by any income support activity and client type
Albertan youth aged 18 to 24

Socio-economic status of Albertan youth

Tables

Table 1. Number and percent of youth, socio-economic status (SES) of Albertan youth aged 12 to 24 years, 2008/09

Socio-economic status of Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided¹. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school

Socio-economic status of Albertan youth

Definitions and Notes (continued)

youth with no credits.

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Alberta Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with Alberta Health for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)¹⁰. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Maltreatment-related investigations** occur when there is a concern that the safety or well-being of a youth is threatened. Outcomes of investigation include *in care after investigation* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), *out of care services* (the youth remains in the home and the family receives support services), and *no intervention needed*.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services).
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs. The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).

Socio-economic status of Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Educational experiences of Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report is an overview of the educational experiences of 272,588 Albertan youth aged 12 to 20 years registered in Alberta's K-12 education system in 2008/09. Educational achievement was categorized as above, meeting, or below expectations for a student's age and grade. School authority types included public, separate, Francophone, charter, private, and other. No data were available for students who attended schools on First Nations reserves or in Lloydminster. See *Definitions and Notes* for details.

The report describes how educational achievement and school authority type varied by age, gender, region of residence, socio-economic status, mental health status, and health service use. The cross-ministry service use of youth registered in K-12 education was also studied.

- 79% of youth 12 to 17 years old and 17% of youth aged 18 to 20 were registered in the K-12 education system. 68% of students were meeting educational expectations, 19% were below expectations, and 11% were exceeding expectations.
- Overall, most students were meeting or above educational expectations. Students performing below educational expectations were more likely to be male, to live in a lower socio-economic status neighbourhood, to have received services for a mental health condition, to visit an emergency room, or to be hospitalized during the year.
- Poor educational performance was associated with receiving maltreatment-related intervention services, receiving Family Support for Children with Disabilities services, being charged with an offence (particularly multiple charges), being involved in corrections (particularly custody), or receiving income support at some point during the year 2008/09.
- 73% of youth were registered in public schools, and 22% in private schools. School authority type varied with age, region of residence, socio-economic status, educational achievement, mental health status, and emergency room use.
- Students facing challenges, such as receiving intervention services, being charged with an offence, or receiving income support, were more likely to be registered in public schools than any other school authority type.

Educational experiences of Albertan youth

Context

The benefits of an education are well documented. Graduating successfully from high school, for example, is associated with greater financial security and lower unemployment rates.¹ Education provides access to the resources, knowledge and support that are necessary for positive health outcomes.² High school graduates make more use of preventative medical services, make fewer multiple visits to doctors and have better general health status than non-graduates.³

Canadian results from an OECD study show that gender, socio-economic status, region of residence and child intervention status are factors associated with educational achievement. Among Canadian youth at age 15, girls perform significantly better than boys in reading, whereas boys perform better in math.⁴ Performance in science is better among students from higher socio-economic status backgrounds than among those from lower socio-economic status backgrounds.⁴

Previous reports have shown that, while Albertan students tend to achieve above the national average on a range of educational outcomes, rural Albertan students have significantly lower reading scores than their urban counterparts.⁵ Provincial test scores and high school completion rates are also consistently lower for youth in care compared to other Albertan youth.⁶

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Educational experiences of Albertan youth

Educational achievement (Table 2)

This analysis and the following eleven analyses describe the educational achievement of 272,588 youth (aged 12 to 20 years) who were registered in Alberta's education system in 2008/09. An educational achievement rating was not available for 2.5% of the population. See *Definitions and Notes* (p. 21).

- Over two thirds (68%) of students were meeting educational expectations, 19% were performing below expectations, and 11% were exceeding educational expectations.

Educational achievement
Albertan youth aged 12 to 20

Educational achievement by age
Albertan youth aged 12 to 20

Educational achievement by age (Table 3)

Student achievement was determined differently for each age group. The performance of younger youth was primarily evaluated using provincial tests scores, whereas number of credits and course grades were primarily used to evaluate older youth.

- About 15% of students between 15 and 16 years, and 12% of 17 year olds were achieving above educational expectations. These rates are higher than for other ages.
- About one-third of older students (aged 19 and 20 years) were performing below expectations, a higher rate than for younger students.

Educational achievement by age and gender (Table 4)

Due to small numbers, data for 20 year old youth are not shown in this analysis.

- Between the ages of 12 and 14 years, female students were slightly more likely to be meeting educational expectations than males.
- Between the ages of 14 and 17 years, female students were more likely to perform above expectations compared to males.
- Between 12 and 19 years, male students were consistently more likely to perform below expectations compared to females.

Educational achievement by age and gender
Albertan youth aged 12 to 19

Educational experiences of Albertan youth

Educational achievement by region of residence
Albertan youth aged 12 to 20

Educational achievement by region of residence (Table 5)

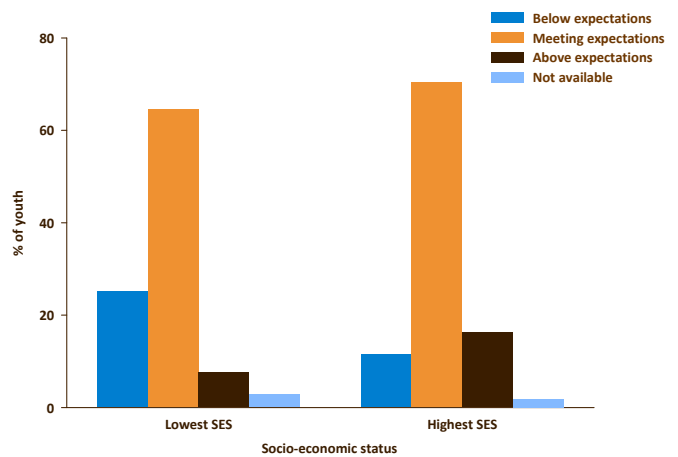

- Across all regions, the large majority of students was meeting or performing above educational expectations.
- However, as community size increased, the proportion of students performing below expectations decreased and the proportion of students achieving above expectations increased.
- 12% percent of students living in large centres (Edmonton and Calgary) were achieving above expectations.

Educational achievement by socio-economic status (Table 6)

Socio-economic status captures the social and material environments in which youth lived. In this report, “lowest socio-economic status” refers to the lowest group while “highest” refers to the highest group. See *Definitions and Notes* (p. 21).

- Students living in the lowest socio-economic status neighbourhoods were more likely to perform below expectations (25%) and less likely to perform above expectations (8%) than students living in the highest socio-economic status neighbourhoods (12% and 16%, respectively).

Educational achievement by socio-economic status (SES)
Albertan youth aged 12 to 20

Educational achievement by mental health status
Albertan youth aged 12 to 20

Educational achievement by mental health status (Table 7)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 22).

- 36% of students with a mental health condition were performing below expectations during 2008/09. Less than 5% of students with a mental health condition were achieving above educational expectations.

Educational experiences of Albertan youth

Educational achievement by health service use (Table 8)

This analysis describes youth (aged 12 to 20 years) registered in the Alberta Health Care Insurance Plan in 2008/09.

- Among youth exceeding educational expectations, 55% saw a physician between one and four times in the year, compared to 45% performing below expectations.
- Compared to other students, students performing below educational expectations were more likely to visit emergency rooms or hospitals at least once.

Educational achievement by health service use
Albertan youth aged 12 to 20

Educational achievement by type of maltreatment-related intervention
Albertan youth aged 12 to 20

Educational achievement by type of maltreatment-related intervention (Table 9)

This analysis considers youth (aged 12 to 20 years) who received a maltreatment-related intervention from Human Services in 2008/09. A maltreatment-related intervention occurs when the safety or well-being of a youth is threatened. See *Definitions and Notes* (p. 22).

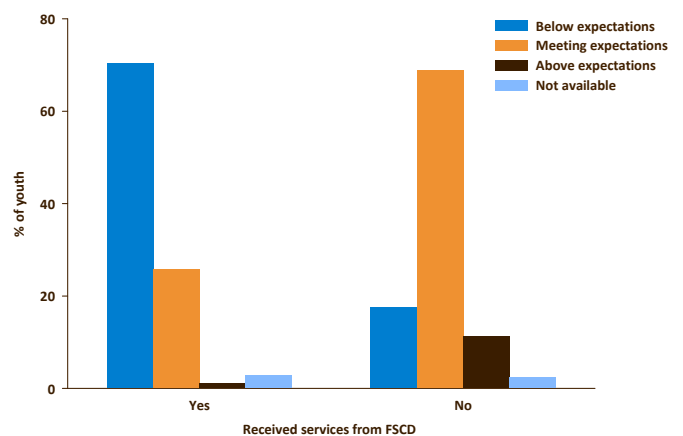

- Among youth not investigated, 18% were performing below educational expectations, compared to 56% of youth receiving *out of care services*, and 60% of youth receiving *in care services*.

Educational achievement of youth receiving services from Family Support for Children with Disabilities (Table 10)

This analysis considers youth (aged 12 to 18 years) who received services from Family Support for Children with Disabilities (FSCD) in 2008/09. Some youth receiving FSCD services had disabilities that would be expected to directly affect their school performance.

- 70% of youth receiving FSCD services were performing below expectations, compared to 18% of youth not receiving services. 28% of youth receiving FSCD services were meeting or exceeding expectations compared to 80% of youth not receiving services.

Educational achievement of youth receiving services from Family Support for Children with Disabilities (FSCD)
Albertan youth aged 12 to 18

Educational experiences of Albertan youth

Educational achievement by number of charges
Albertan youth aged 12 to 17

Educational achievement by number of charges (Table 11)

This analysis considers youth (aged 12 to 17 years) who were charged with an offence in 2008/09.

- More charges were associated with poorer educational achievement.
- Among youth with no charges, 17% were performing below expectations, compared to 81% of youth with four or more charges.

Educational achievement by type of corrections involvement (Table 12)

This analysis considers the educational achievement of youth (aged 12 to 17 years) who were registered in Alberta's K-12 education system and who were in custody (in which a sentence is served in a young offender facility) or had a community sentence or pre-trial supervision in 2008/09.

- Among youth not involved in corrections, 17% were performing below educational expectations, compared to 63% of youth with a community sentence/pre-trial supervision, and 86% of youth in custody.

Educational achievement by type of corrections involvement
Albertan youth aged 12 to 17

Educational achievement of youth
with any income support activity by client type,
Albertan youth aged 18 to 20

Educational achievement of youth with any income support activity by client type (Table 13)

This analysis describes youth aged 18 to 20 years with any income support activity from Human Services during 2008/09 by client type. Client type categories include *expected to work* (clients looking for work, or unable to work in the short term) and *barriers to full employment* (clients having difficulty finding work due to disabilities or other barriers).

- Among youth with no income support activity, 28% were performing below expectations, compared to 62% of youth *expected to work*, and 80% of youth who experienced *barriers to full employment*.

Educational experiences of Albertan youth

School authority type (Table 14)

This analysis and the following eleven analyses consider youth (aged 12 to 20 years) registered in Alberta's K-12 education system, and the school authority type in which they were enrolled in 2008/09. See *Definitions and Notes* (p. 23).

- The vast majority (73%) of students were registered in public schools. 22% of students were registered in separate schools, and less than 5% were attending either Francophone (0.6%), charter (0.8%), private (3.8%), or other schools (0.1%, not shown).

School authority type
Albertan youth aged 12 to 20

School authority type by age
Albertan youth aged 12 to 20

School authority type by age (Table 15)

The *other* school authority type was not included in this analysis due to small numbers for some ages.

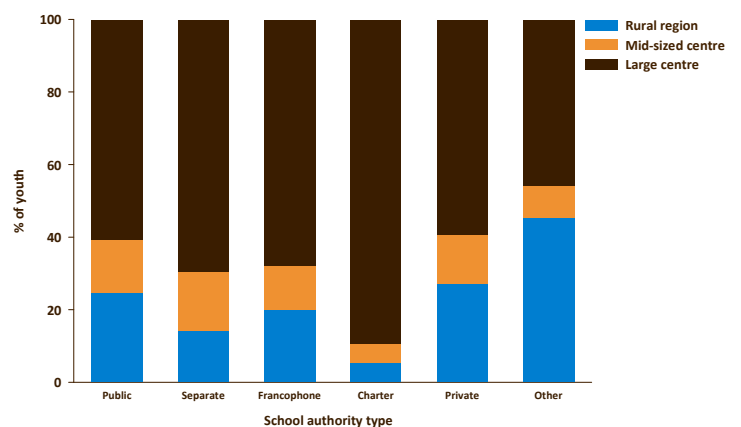

- Across all ages, at least 69% of students were registered in public schools. 81% of older youth (19 to 20 years) were registered in public schools.
- Almost one-quarter of youth between 12 and 14 years were registered in the separate school system.
- The highest percentages of youth registered in private schools were among 12 year olds (5%) and youth between 19 and 20 years (5%).

School authority type by region of residence (Table 16)

To provide context, 63% of students between 12 and 20 years were living in large centres (Edmonton and Calgary), 15% lived in mid-sized centres, and 22% lived in rural regions across Alberta.

- Almost 90% of all charter school students were located in large urban centres. The majority of public (61%), separate (69%), and Francophone (68%), and private (59%) school students were also located in large centres (Edmonton and Calgary).
- Other* authority types (45%) had the largest proportion of students in rural areas.

School authority type by region of residence
Albertan youth aged 12 to 20 years

Educational experiences of Albertan youth

School authority type by socio-economic status (SES)
Albertan youth aged 12 to 20

School authority type by socio-economic status (Table 17)

Socio-economic status captures the social and material environments in which youth lived. See *Definitions and Notes* (p. 21).

- Almost 30% of students in both private and charter schools were living in the most privileged socio-economic status neighbourhoods.
- 36% of students registered in *other* school authority types, and over one-quarter of students attending Francophone schools, were living in the most deprived socio-economic status areas.

School authority type by educational achievement (Table 18)

- Across all school authority types, the majority of students were either meeting or exceeding educational expectations.
- Compared to all other school authority types, charter schools had the greatest proportion of students (19%) achieving above educational expectations.
- Private (25%) and public (20%) institutions had the highest proportion of students performing below educational expectations.

School authority type by educational achievement
Albertan youth aged 12 to 20

School authority type by mental health condition
Albertan youth aged 12 to 20

School authority type by mental health condition (Table 19)

Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 22).

- Representing the highest proportion among all school authority types, 16% of students registered in *other* schools had a mental health condition.
- Francophone schools had the lowest proportion of students with a mental health condition (6%).

Educational experiences of Albertan youth

School authority type by health service use (Table 20)

This analysis describes youth (aged 12 to 20 years) registered in the Alberta Health Care Insurance Plan in 2008/09.

- Emergency room visits varied with school authority type. Among youth enrolled in public schools, 27% had visited an emergency room at least once during the year, compared to 22% of separate school students, and 21% of students enrolled in the remaining school authority types.
- Across all school authority types, about 23% of youth had no health service use during the year.

School authority type of youth receiving a maltreatment-related intervention

School authority type of youth receiving a maltreatment-related intervention (Table 21)

This analysis considers youth (aged 12 to 20 years) who received a maltreatment-related intervention in 2008/09. A maltreatment-related intervention occurs when the safety or well-being of a youth is threatened. See *Definitions and Notes* (p. 22).

- 2.2% of youth (4,360 youth) registered in public schools were receiving maltreatment-related intervention services. Fewer registered in separate schools (1.3%, 765 youth) and the remaining authority types (1.7%, 242 youth) received these services.

School authority type of youth receiving services from Family Support for Children with Disabilities (Table 22)

This analysis describes the school authority type of youth (aged 12 to 18 years) who received services from Family Support for Children with Disabilities (FSCD) in 2008/09.

- The representation of youth receiving FSCD services was similar across school authority types, with the highest proportion in public schools (1.2%; 2,332 youth), followed by remaining school authority types (1.3%; 224 youth) and separate schools (1%, 614 youth).

School authority type of youth receiving services from Family Support for Children with Disabilities

Educational experiences of Albertan youth

School authority type of youth with charges
Albertan youth aged 12 to 17

School authority type of youth with charges (Table 23)

This analysis describes the school authority type of youth aged 12 to 17 years who were charged with an offence in 2008/09.

- 2.1% of students (3,760 youth) in public schools had been charged with at least one offence. Students charged with at least one offence were less likely to be registered in separate schools (1.3%, 745 youth) and the remaining school authority types (0.65%, 114 youth).

School authority type of youth involved with corrections (Table 24)

This analysis describes the school authority type of youth aged 12 to 17 years who were in custody (in which a sentence is served in a young offender facility) or with a community sentence or pre-trial supervision in 2008/09.

- 1.8% (3,236 youth) of youth in public schools were involved with corrections. Smaller proportions comprised the student population enrolled in separate schools (1.1%, 665 youth), and the remaining school authority types (0.6%, 94 youth).

School authority type of youth in corrections
Albertan youth aged 12 to 17

School authority type of youth with any income support activity
Albertan youth aged 18 to 20

School authority type of youth receiving income support (Table 25)

This analysis describes the school authority type of youth aged 18 to 20 years with any income support activity in 2008/09.

- 1.9% (443 youth) of students in public schools had any income support activity, while smaller proportions of students enrolled in separate schools (1.3%, 73 youth), and the remaining school authority types (1.7%, 33 youth) had any income support activity.

Educational experiences of Albertan youth

Tables (school authority type continued)

Table 18. Number and percent of youth registered in Alberta's education system by school authority type and educational achievement, Albertan youth aged 12 to 20 years, 2008/09

	Educational achievement	School authority type					Total
		Public	Separate	Francophone	Charter	Private	
Number of youth	Below expectations	39,433	8,661	247	234	2,056	50,631
	Meeting expectations	135,245	42,972	1,198	1,594	4,832	185,841
	Above expectations	20,395	6,980	165	429	1,413	29,382
	Total	195,073	58,613	1,610	2,257	8,301	265,854
Percent of youth	Below expectations	20.2	14.8	15.3	10.4	24.8	19.0
	Meeting expectations	69.3	73.3	74.4	70.6	58.2	69.9
	Above expectations	10.5	11.9	10.2	19.0	17.0	11.1
	Total	100.0	100.0	100.0	100.0	100.0	100.0

Due to the unavailability of adequate information, an educational achievement rating was not possible to determine for about 20% of students in private schools and for smaller proportions in the remaining school authority types. None of the students enrolled in the "other" school authority category received an educational achievement rating.

Educational experiences of Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁷. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.

Educational experiences of Albertan youth

Definitions and Notes (continued)

- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student's age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in 'other' schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.
- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with Health for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁸. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- **Maltreatment-related investigations** occur when there is a concern that the safety or well-being of a youth is threatened. Outcomes of investigation include *in care after investigation* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), *out of care services* (the youth remains in the home and the family receives support services), and *no intervention needed*.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services).
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.

Definitions and Notes (continued)

- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs. The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).

- **School authority types**

There is one publicly-funded system of education in Alberta. The public system includes public, separate, Francophone and charter schools.

- **Public** schools are non-denominational schools.
- **Separate** schools are established under rights guaranteed by the Constitution of Canada for the minority religion (Protestant or Roman Catholic).
- **Francophone** schools provide instruction in French to children whose parents have rights under section 23 of the Canadian Charter of Rights and Freedoms.
- **Charter** schools are autonomous public schools designed to meet the needs of students through a specific program or approach. They must be non-religious.

Private schools operate outside the public education system. Private schools may charge tuition and other fees. There are two kinds of private schools.

- Accredited private schools must offer the Alberta Program of Studies with certificated teachers; they may be partially funded or non-funded.
- Registered private schools are not required to offer the Program of Studies and are not funded.

Other schools are accredited post-secondary institutions offering high school courses for credit to adults.

- No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- Youth involved in corrections may have received educational programs from a school authority that was different from the school authority type they attended while not involved in the correctional system. The school authority assigned to the youth for analyses in this report may or may not have been the school authority type in which they were enrolled while involved in corrections.

Educational experiences of Albertan youth

Educational experiences of Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Mental health status of Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report is an overview of 66,792 Albertan youth (12 to 24 years) who received services for mental health conditions in 2008/09. Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition.

The relationships between mental health status and age, gender, region of residence, socio-economic status, educational achievement, and health service use were considered. The cross-ministry service use of youth who received services for mental health conditions was also studied.

- 11% of Albertan youth received services for mental health conditions in 2008/09.
- *Mood/anxiety* and *behavioural* disorders were the most common mental health conditions, with *mood/anxiety* conditions generally more common in females and *behavioural* conditions more common in males. The percentage of youth with mental health conditions increased with age for females, but was stable across age for males.
- There was little effect of region of residence or socio-economic status on mental health status.
- The rate of mental health conditions was higher for youth who performed below educational expectations, who visited physicians five or more times, who visited emergency rooms, or who were hospitalized (youth with *schizophrenia/psychoses* were particularly likely to be hospitalized).
- Youth who received maltreatment-related intervention services, were charged with an offence, were involved in corrections, were enrolled in a part-time post-secondary program, or received income support were more likely to have received services for a mental health condition than youth who did not have these ministry service involvements.

Mental health status of Albertan youth

Context

Good mental health is a cornerstone of overall health, and the mental health status of youth has recently become a major focus of social programs and policy. Specifying exactly what is meant by mental health is difficult, and consequently definitions vary widely. Interpretation of findings related to the mental health of youth, including those in this report, must give careful consideration to how mental health was measured.

Personal and societal costs of mental health issues in youth are high. According to Waddell et al. (2005), 14% of Canadians aged 4 to 17 years are affected by mental health disorders that are serious enough to cause distress or impairment at home, school, and in the community¹. Youth with untreated mental health disorders have been found to have elevated rates of use of services such as health care, justice and corrections, special education programs, foster care, and income support².

Youth who report lower levels of satisfaction with and control over their lives, reduced sense of belonging, or impaired relationships have a lower level of mental health.³ Aboriginal youth living off reserves are less likely than the overall population of youth to report having good or excellent mental health, while immigrants are more likely to report this than the overall population.³ More than two thirds of sexual minority youth do not feel a sense of belonging to their school community. Youth living in low income situations (who are more likely than the overall population to be Aboriginal, immigrant, or homeless youth) are more stressed than youth not living in low income.³

Children who are resilient to mental health problems tend to have strong learning abilities, good social skills, long-term support from one or more adults, feelings of competency, and positive beliefs about their purpose in the world, and cohesive families and communities¹.

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Mental health status of Albertan youth

Mental health status (Table 1)

Mental health data were analyzed for all youth (aged 12 to 24 years) who were registered with the Alberta Health Care Insurance Plan for the duration of 2008/09.

- In 2008/09, there were 66,792 youth who received services for one or more mental health conditions. This represents 11% of Albertan youth.

Percent with a mental health condition
Albertan youth aged 12 to 24

Percent with a mental health condition by type of condition
Albertan youth aged 12 to 24

Mental health conditions (Table 1)

See table below for example conditions for mental health categories and *Definitions and Notes* (p. 20) for a description of coding.

- Mood/anxiety* conditions were the most common mental health diagnoses in Albertan youth, affecting 8% of Albertan youth.

Mental health conditions, example diagnoses

Category name*	Examples
Mood/anxiety	Anxiety, depression, bipolar disorder, etc.
Behavioural	Attention-deficit disorder, regulatory disorder, mental/behavioural problems due to substance use, etc.
Neurodevelopmental	Autism, fetal alcohol spectrum disorder, cerebral palsy, etc.
Schizophrenia/psychoses	Schizophrenia, psychosis, delusional disorder, etc.

*Mental health condition categories are not mutually exclusive

Mental health status of Albertan youth

Percent with a mental health condition by age and gender
Albertan youth aged 12 to 24

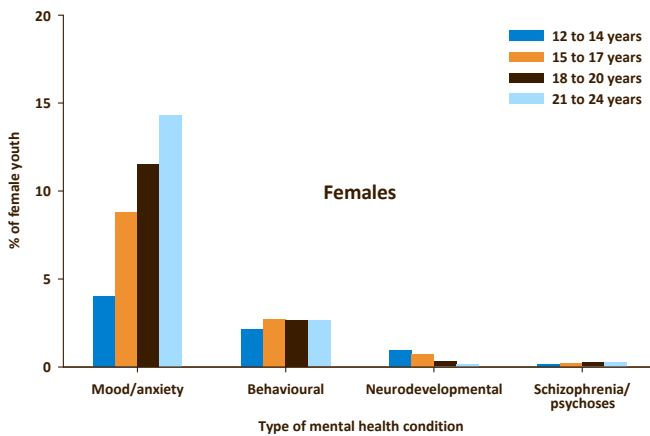

Mental health status by age and gender (Tables 2 and 3)

- The percentage of female youth with mental health conditions increased with age. For males, the rate was stable across age.
- Between ages 12 and 14 years, males had higher rates of mental health conditions than females.
- From age 16 on, females had higher rates of mental health conditions than males.

Mental health condition by age group and gender (Tables 4 and 5)

Percent with a mental health condition by type of condition and age group
female Albertan youth aged 12 to 24

Percent with a mental health condition by type of condition and age group
male Albertan youth aged 12 to 24

- Female youth with a mental health condition were most likely, in all age groups, to have a *mood/anxiety* disorder. The rate of *mood/anxiety* disorders in females increased markedly with increasing age.
- Male youth with a mental health condition most often had *mood/anxiety* or *behavioural* conditions, with *mood/anxiety* conditions increasing in frequency and *behavioural* conditions decreasing in frequency with increasing age.
- *Mood/anxiety* disorders were more common in females than males from age group 15 to 17 years and onward, while behavioural disorders were more common in males than females up to age group 15 to 17 years. *Neurodevelopmental* and *schizophrenia/psychoses* conditions were rare, but generally more common in males than in females.

Mental health status of Albertan youth

Mental health status by region of residence (Table 6)

- Among youth living in mid-sized and large centres, 11% had a mental health condition. This rate is similar to the 10% of rural Albertan youth who had a mental health condition.
- Rates for different types of mental health conditions varied little across region of residence (not shown in graph).

Mental health status by socio-economic status (Table 7)

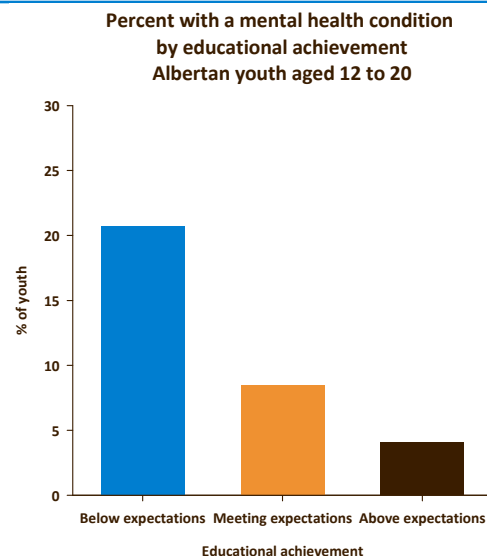

Socio-economic status captures the social and material environments in which youth live. Only the highest and lowest socio-economic status groups are shown in this and the following analysis. See *Definitions and Notes* (p. 19).

- Socio-economic status was not substantially associated with the overall likelihood of having a mental health condition as measured in this study.
- Youth living in the lowest socio-economic areas had slightly higher rates of *mood/anxiety* disorders than youth living in the highest socio-economic areas (not shown in graph).

Mental health status by educational achievement (Table 8)

The next four analyses consider youth (aged 12 to 20 years) who were enrolled in the K-12 education system in Alberta in 2008/09. See *Definitions and Notes* (p. 19).

- There was a strong relationship between educational achievement and the presence of any mental health condition.
- Youth who were performing below expectations in school had a mental health condition in 21% of cases, compared with 9% of youth meeting expectations and 4% of those achieving above expectations.

Mental health status of Albertan youth

Percent with a mental health condition by type of condition and educational achievement
Albertan youth aged 12 to 20

Mental health condition by educational achievement (Table 8)

- *Neurodevelopmental* conditions were substantially more common among youth who performed below expectations (4.7%) than youth meeting (0.5%) or above expectations (0.1%).
- *Mood/anxiety* conditions, *behavioural* conditions, and *schizophrenia/psychoses* conditions were also most common among youth who performed below expectations.

Mental health status by school authority type (Table 9)

See *Definitions and Notes* (p. 20) for description of school authority types.

- Rates of mental health conditions were similar across all school authority types.

Percent with a mental health condition by school authority type
Albertan youth aged 12 to 20

Percent with a mental health condition by type of condition and school authority type
Albertan youth aged 12 to 20

Mental health condition by school authority type (Table 9)

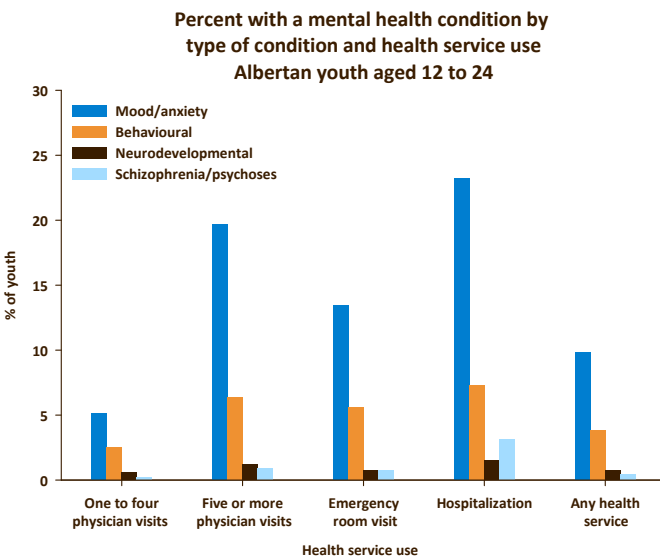

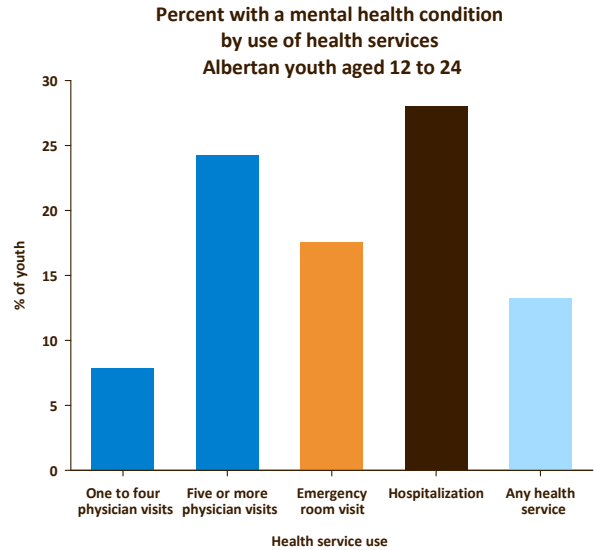

- *Mood/anxiety* conditions were slightly higher in public (7%) compared to *separate* (6%) or *remaining authority types* (5%).
- Higher rates of *behavioural* and *neurodevelopmental* conditions were observed in *remaining authority types* (4.3%, 1.9%) compared to either *public* (3.9%, 1.3%) or *separate* (3.2%, 1.1%) schools. This may reflect specialized services provided at some schools.

Mental health status of Albertan youth

Mental health status by health service type (Table 10)

The next two analyses consider youth (aged 12 to 24 years) who were registered with the Alberta Health Care Insurance Plan in 2008/09.

- 28% of youth who were hospitalized had a mental health condition, compared with 24% of youth with five or more physician visits, 18% of youth who visited emergency rooms, and 8% of youth with one to four physician visits.

Mental health condition by health service type (Table 10)

- 23% of youth who were hospitalized had a *mood/anxiety* condition, compared with 20% of those with five or more physician visits, 14% of those visiting emergency rooms, and 5% of youth with one to four physician visits.
- The percentage of youth with *schizophrenia/psychoses* was higher among hospitalized youth (3.2%) than among youth visiting emergency rooms (0.8%) or youth visiting physicians five or more times (0.9%).

Mental health status by type of maltreatment-related intervention services (Table 11)

This and the following five analyses are based on youth (aged 12 to 17 years) in Alberta in 2008/09. Maltreatment-related intervention services occur when the safety or well-being of the youth is threatened. See *Definitions and Notes* (p. 21).

- A mental health condition occurred in 9% of youth who did not receive maltreatment-related intervention services. This rate was much higher in youth who were in care (43%) and in youth receiving out of care intervention services (32%).

Mental health status of Albertan youth

Percent with a mental health condition by type of condition and type of maltreatment-related intervention service
Albertan youth aged 12 to 17

Mental health condition by type of maltreatment-related intervention services (Table 11)

- Service use for all mental health conditions was higher for youth who received maltreatment-related intervention services than for youth with no maltreatment-related intervention services.
- For all mental health conditions there was a gradient in the percentage of youth with these conditions, such that the highest rates were for youth receiving in care services, followed by youth receiving out of care services, and then youth needing no interventions.

Mental health status by number of charges (Table 12)

Youth with offence charges include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). See *Definitions and Notes* (p. 20).

- The percentage of youth with a mental health condition increased with number of charges.
- Youth with no charges had a mental health condition in 9% of cases, compared with a rate of 30% in youth who had four or more charges.

Percent with a mental health condition by number of charges
Albertan youth aged 12 to 17

Percent with a mental health condition by type of condition and number of charges
Albertan youth aged 12 to 17

Mental health condition by number of charges (Table 12)

- *Mood/anxiety* conditions were the most common mental health condition in all groups and were markedly more common among charged youth.
- Youth with four or more charges were more likely to have *behavioural* conditions (18%) than youth with two to three charges (14%), youth with one charge (13%) and youth with no charges (3%).
- Rates of *schizophrenia/psychoses* increased slightly with number of charges.
- Rates of neurodevelopmental conditions varied little across number of charges.

Mental health status of Albertan youth

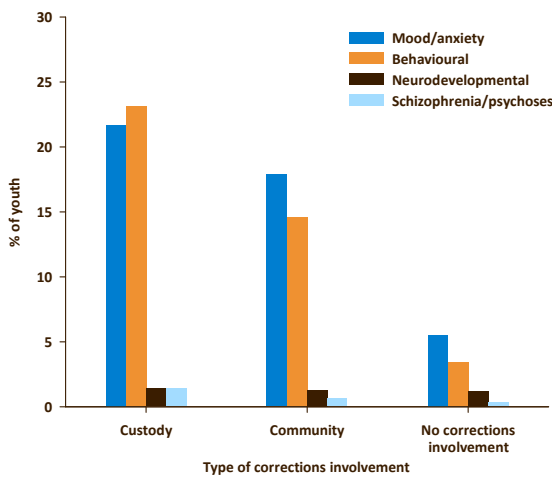

Mental health status by corrections involvement (Table 13)

Youth with corrections involvement have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (in which the sentence is served in the community) or custody (in which the sentence is served in a young offender facility). See *Definitions and Notes* (p. 21).

- The highest rate of mental health conditions was for youth in custody (35%).

Percent with a mental health condition by type of condition and type of corrections involvement (Albertan youth aged 12 to 17)

Mental health condition by corrections involvement (Table 13)

- *Mood/anxiety* and *behavioural* conditions were substantially more likely among youth involved in corrections (18%) than among youth not involved in corrections (6%).
- *Behavioural* conditions were the most frequent mental health condition among youth in custody whereas *mood/anxiety* conditions were most frequent for the other groups of youth.
- Note that *neurodevelopmental* conditions, including fetal alcohol spectrum disorder, are underestimated because data from community mental health clinics were not available for these analyses.

Mental health status by post-secondary enrolment (Table 14)

Youth (17 to 24 years) enrolled in post-secondary institutions in 2008/09 are considered in the next two analyses, in comparison to youth not enrolled in post-secondary institutions. See *Definitions and Notes* (p. 21).

- A mental health condition was present in 11% of youth enrolled in full-time programs, which is equivalent to the rate for those not enrolled in post-secondary programs (12%).
- The rate was elevated (15%) for youth in part-time programs.

Mental health status of Albertan youth

Percent with a mental health condition by type of condition and post-secondary enrolment status
Albertan youth aged 17 to 24

Mental health condition by post-secondary enrolment (Table 14)

- The higher rate of mental health conditions among youth enrolled in part-time programs compared to those in full-time programs (shown in previous graph) was primarily due to a higher rate of *mood/anxiety* conditions.

Mental health status by income support (Table 15)

Income support refers to financial benefits provided to individuals and couples (aged 18 to 24 years) who cannot meet their basic needs. The client types for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment). See *Definitions and Notes* (p. 21).

- Youth receiving income support and experiencing *barriers to full employment* were most likely to have a mental health condition.

Percent with a mental health condition by income support category
Albertan youth aged 18 to 24

Percent with a mental health condition by type of condition and income support category
Albertan youth aged 18 to 24

Mental health condition by income support (Table 15)

There were not enough youth with *neurodevelopmental* conditions across income support categories to graph.

- Youth experiencing *barriers to full employment* had substantially higher rates of *schizophrenia/psychoses* (6.4%) than youth *expected to work* (1.2%) and youth not on income support (0.4%).
- Mood/anxiety* and *behavioural* conditions were substantially elevated in both the *expected to work* group and *barriers to full employment* group in comparison to youth not receiving income support.

Mental health status of Albertan youth

Tables

Table 1. Number and percent of youth by mental health condition and age group, Albertan youth aged 12 to 24 years, 2008/09

Mental health status of Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Mental health status of Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan or the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁵. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.

- **School authority types**

There is one publicly-funded system of education in Alberta. The public system includes public, separate, Francophone and charter schools.

- **Public** schools are non-denominational schools.
- **Separate** schools are established under rights guaranteed by the Constitution of Canada for the minority religion (Protestant or Roman Catholic).
- **Francophone** schools provide instruction in French to children whose parents have rights under section 23 of the Canadian Charter of Rights and Freedoms.
- **Charter** schools are autonomous public schools designed to meet the needs of students through a specific program or approach. They must be non-religious.

Private schools operate outside the public education system. Private schools may charge tuition and other fees. There are two kinds of private schools.

- Accredited private schools must offer the Alberta Program of Studies with certificated teachers; they may be partially funded or non-funded.
- Registered private schools are not required to offer the Program of Studies and are not funded.

Other schools are accredited post-secondary institutions offering high school courses for credit to adults. Schools on First Nations reserves are not funded by Alberta Education; students who attended these schools are not included in the youth enrolled in the K to 12 education system.

Mental health status of Albertan youth

Definitions and Notes (continued)

- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services).
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included. When a student was enrolled in more than one session in the study year, one session was chosen to provide values for credential type, enrolment status, and institution type for that individual. Full-time enrolments were chosen over part-time, winter session enrolments were chosen over fall sessions, and fall sessions were chosen over spring and summer enrolments. If only spring or summer enrolments occurred, the session was randomly chosen from among the spring and summer enrolments.
- **Enrolment status** for post-secondary programs consists of full-time (students who enrolled in at least 60% of a full course load in at least one session in the academic year) or part-time (students who were enrolled in less than 60% of full course load in all sessions attended for the academic year).
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs. The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).

Mental health status of Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Key findings

This report provides a profile of 3,764 Albertan youth (aged 12 to 18 years) who received Family Support for Children with Disabilities (FSCD) program services from Human Services in 2008/09. Service categories include *family support services*, *child-focused services*, *specialized services* and *out of home services* (see *Definitions and Notes*, p.14). In addition, FSCD assists with some of the extraordinary costs of raising a child with a disability. To receive FSCD services, medical documentation must be provided confirming that the child has a disability or is awaiting a diagnosis; primary diagnoses categories are derived from these medical diagnoses. Not all eligible families choose to access the FSCD program and there are additional health and education programs that support children with disabilities. As such, there are more children with disabilities in the province than those that receive FSCD services.

Youth are described by FSCD service category, primary disability diagnoses, age, gender, region of residence, socio-economic status, school authority type, educational achievement and health service use. The report also provides an overview of cross-ministry service use for these youth

- 1.0% of Albertan youth aged 12 to 18 received FSCD services in 2008/09.
- Overall, the majority of youth receiving FSCD services received *child-focused services* and had a primary diagnosis of a developmental impairment.
- Compared to youth not receiving FSCD services, youth who received FSCD services were more likely to be male, younger than 15 years of age, to live in low middle socio-economic status neighbourhoods, to perform below educational expectations, and to have higher use of health services.
- Youth receiving FSCD services were more likely than youth not receiving FSCD services to be enrolled in Alberta's K-12 education system, to receive maltreatment-related intervention services or to receive income support.

Context

Families with children and youth who have disabilities may require a wide range of supports to assist them in meeting the needs of their children. Statistics Canada reports that in Alberta, approximately 5% of children and youth aged 5 to 24 years have a disability.¹ The most common disabilities reported among children 5 to 14 years of age in Canada are learning disabilities, chronic health conditions, and speech, psychological, and developmental disabilities, while the most common disabilities reported by 15 to 24 year olds include learning disabilities, and disabilities related to pain, mobility, and agility.²

Research indicates that families of children with disabilities are more likely to be living in low income neighbourhoods than families with non-disabled children.³ Additionally, parents of children with severe disabilities are more likely to report high levels of daily stress and find that their employment, financial situation and personal activities are significantly impacted by their child's disability. These parents also report difficulty in finding adequate help and childcare.³

Outcomes for children with disabilities improve in the context of adequate income, supported parenting (including employment leaves, flexible work schedules, availability of child care), and community supports (such as integrated delivery of health, education, social, and recreational services).⁴

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth

Educational experiences of Albertan youth

Mental health status of Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Maltreatment-related investigations among Albertan youth

Maltreatment-related intervention services received by Albertan youth

Physician visits by Albertan youth

Emergency room visits by Albertan youth

Hospitalizations of Albertan youth

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Youth receiving services through FSCD

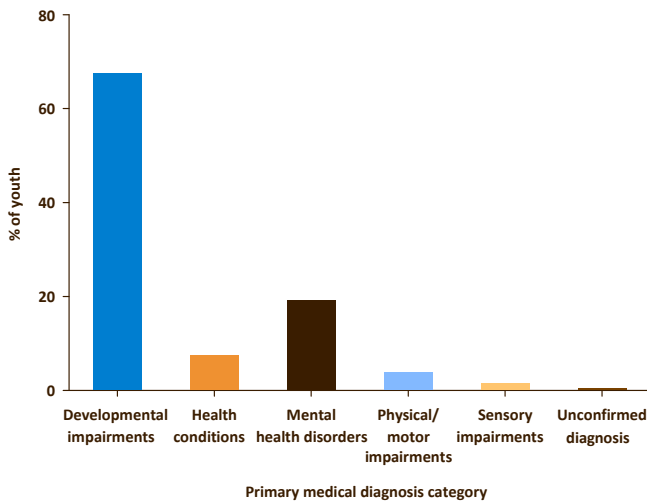

(Table 1)

This analysis considers the highest level of FSCD services received (see *Definitions and notes*, p.15) by families of youth (age 12 to 18 years) in Alberta in 2008/09.

- There were 3,764 youth (aged 12 to 18 years) who received FSCD services, representing 1.0% of 365,112 Albertan youth in that age range.
- Of those receiving FSCD services, the majority (80%) received *child-focused* services, 13% received *family-focused* services, 5% received *out-of-home* placement services, and 2% received *specialized* services.

Primary medical diagnosis category
Albertan youth aged 12 to 18 receiving FSCD services

Primary diagnosis (Table 2)

This analysis looks at the primary medical diagnosis (see *Definitions and Notes*, p.15) for youth (aged 12 to 18 years) who received FSCD services in 2008/09.

- Most youth receiving FSCD services had a primary diagnosis of developmental impairment (68%), followed by mental health disorder (19%), health condition (7%), physical/motor impairment (4%), sensory impairments (1.5%) and lastly unconfirmed conditions (0.5%). Under the unconfirmed conditions category, youth received FSCD services while awaiting a formal diagnosis.

FSCD service group by primary diagnosis category (Table 3)

This analysis looks at youth (aged 12 to 18 years) grouped according to the highest level of service received by the primary diagnosis category. Primary diagnosis categories were re-grouped into developmental impairments, health conditions and mental health disorders. Physical/motor and sensory impairments were merged into health conditions, and unconfirmed diagnoses were excluded.

- Most youth receiving FSCD services had a primary diagnosis of developmental impairment.
- Health and mental health conditions were most predominant in the *family-focused* group.

FSCD service group by primary diagnosis category
Albertan youth aged 12 to 18

Family Support for Children with Disabilities services received by Albertan youth

FSCD service status by age
Albertan youth aged 12 to 18

FSCD service status by age (Table 4)

- Youth receiving FSCD services tended to be younger than youth not receiving FSCD services.

Age by gender (Table 5)

- Overall there were more males than females receiving FSCD services, regardless of their age.
- Within an age group, the percentage of female youth receiving services increased with age.

Age by gender
Albertan youth aged 12 to 18 receiving FSCD services

FSCD service status by region of residence
Albertan youth aged 12 to 18

Region of residence (Table 6)

- There were no region of residence differences between youth receiving FSCD services and youth not receiving FSCD services.

Family Support for Children with Disabilities services received by Albertan youth

Socio-economic status (Table 7)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p.14).

- Youth receiving FSCD services were more likely to live in the low middle (19%) socio-economic neighbourhoods than youth not receiving FSCD services (13%).
- 20% of youth receiving FSCD services lived in the middle socio-economic neighbourhoods compared to 25% of youth not receiving services from the FSCD program.

FSCD service status by socio-economic status (SES)
Albertan youth aged 12 to 18

FSCD service status by school authority type
Albertan youth aged 12 to 18

School authority type (Table 8)

This and the following analysis are limited to youth who received FSCD services and were registered in the K-12 education system in Alberta in 2008/09. See *Definitions and Notes* (p.15).

- Youth receiving FSCD services attended schools in each authority type at a similar rate to Albertan youth not receiving FSCD services.
- Most youth were registered in public schools, regardless of their FSCD status.

School authority type does not include information about home schooling status.

Educational achievement (Table 9)

- 72% of youth receiving FSCD services performed below educational expectations, compared to 18% of youth not receiving FSCD services.
- Youth not receiving FSCD services were more likely to have met (71%) or exceeded (11%) educational expectations.

FSCD service status by educational achievement
Albertan youth aged 12 to 18

Health service use (Table 10)

- Youth who received FSCD services were more likely to have used any health services, to have five or more physician visits, to have visited an emergency room or been hospitalized at least once, compared to youth not receiving FSCD services.
- Youth not receiving FSCD services were most likely to have one to four physician visits.

Cross service use (Table 11)

This analysis looks at the cross-ministry service use of youth (aged 12 to 18 years) who received FSCD services in 2008/09. Youth were considered in this analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p.16). The effects should be interpreted with caution; they cannot be generalized to youth not registered with the AHCIP. 6.6% of youth who received FSCD program services in 2008/09 were not registered with AHCIP.

- Youth (aged 12 to 18 years) receiving FSCD program services were most likely to be enrolled in Alberta’s K-12 education system, to receive maltreatment intervention services, or to have received income support (income support data were available only for youth aged 18 years), than youth not receiving FSCD services.
- Youth (aged 17 to 18 years) receiving FSCD program services were less likely to be enrolled in post-secondary institutions than youth not receiving FSCD services.

	Health registry	100.0	100.0	100.0

*Only youth registered in the Alberta Health Care Insurance Plan were included in this analysis

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Definitions and Notes (continued)

- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs. In addition to information, referral and advocacy, services and supports may include:
 - **Family Support Services** may include assistance with counseling, extraordinary clothing and footwear costs, costs to attend medical appointments and respite.
 - **Child-Focused Services** are provided when a child has a confirmed diagnosis and assessment information to specify their individual needs. These services include respite services, aide supports, child care supports, and health-related supports.
 - **Specialized Services** are available for children with severe disabilities and/or multiple needs. A Multi-Disciplinary Team is part of the review of complex cases and assists in determining services that are appropriate to the health and developmental needs of the child.
 - **Out of Home Services** provide long-term living arrangements and short-term relief care to accommodate the needs of severely disabled, medically fragile children and their families.For the purposes of analysis, families were grouped according to the highest level of service received. For instance, all families that received Out of Home Services were counted in the Out of Home Group regardless of any other services they received. Similarly, only families who did not receive other Child Focused, Specialized or Out-of Home services were included in the Family Support Group.
- **Primary medical diagnosis categories** are Developmental impairments (Autism spectrum disorder, cerebral palsy, chromosomal anomaly, fetal alcohol spectrum disorder, etc.), Health conditions (Cancer, seizure disorder, metabolic/immune disorder, etc.), Mental health conditions (Attention deficit hyperactivity disorder, Tourette's syndrome, schizophrenia, etc.), Physical/motor impairments (Spina Bifida, muscular dystrophy, musculo-skeletal system conditions, etc.), Sensory impairments (Visual impairment/blind, hearing impairment/deaf, etc.) and unconfirmed diagnosis (conditions awaiting formal diagnosis from a professional).
- **School authority types**

There is one publicly-funded system of education in Alberta. The public system includes public, separate, Francophone and charter schools.

 - **Public** schools are non-denominational schools.
 - **Separate** schools are established under rights guaranteed by the Constitution of Canada for the minority religion (Protestant or Roman Catholic).
 - **Francophone** schools provide instruction in French to children whose parents have rights under section 23 of the Canadian Charter of Rights and Freedoms.
 - **Charter** schools are autonomous public schools designed to meet the needs of students through a specific program or approach. They must be non-religious.

Private schools operate outside the public education system. Private schools may charge tuition and other fees. There are two kinds of private schools.

 - Accredited private schools must offer the Alberta Program of Studies with certificated teachers; they may be partially funded or non-funded.
 - Registered private schools are not required to offer the Program of Studies and are not funded.

Other schools are accredited post-secondary institutions offering high school courses for credit to adults. Schools on First Nations reserves are not funded by Alberta Education; students who attended these schools are not included in the study population.

Definitions and Notes (continued)

- **Physician visits** reflect fee claims made by physicians for services provided when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible. *Use this note only if you have an analysis subset to those in the registry.*
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.).
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Maltreatment-related investigations among Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report provides a profile of 7,029 Albertan youth (aged 12 to 17 years) who were the subjects of investigations into possible maltreatment by a parent/guardian in 2008/09. In investigated cases where intervention is not needed, the file is closed (*no intervention needed*). Cases where maltreatment is found to have occurred can lead to interventions that include services within the family home (*out of care services*), or that require the youth to be removed from their home and placed *into care*.

Youth are described in terms of the outcome of the investigation and their Aboriginal status by age, gender, region of residence, socio-economic status, educational achievement, mental health status and health service use. The report also provides an overview of cross-ministry service use for these youth. Comparisons are made to youth of the same ages who were not the subjects of investigations.

- For most investigations, the outcome was *no intervention needed*. 29% of youth investigated were Aboriginal.
- Compared to those not investigated, youth who received a maltreatment-related investigation were more likely to be non-Aboriginal, female, younger than 15 years of age, living in a rural area (*in care* youth only), living in the lowest socio-economic status neighbourhoods, performing below educational expectations, and to have used services for a mental health condition or to have high use of health services.
- Youth who were the subject of an investigation were more likely to be receiving Family Support for Children with Disabilities (FSCD) services, to be charged with an offence, or to be involved in corrections, than youth not investigated.
- Aboriginal youth receiving investigations were more likely than non-Aboriginal youth to receive *in care* services, to live in rural areas or the lowest socio-economic status areas, or to be performing below educational expectations. They were less likely to have received services for a mental health condition, and were less likely to have had five or more physician visits.
- Aboriginal youth receiving investigations were more likely than non-Aboriginal youth to have been charged with an offence or involved with corrections, and less likely to be enrolled in the K-12 education system or to be receiving FSCD services.

Maltreatment-related investigations among Albertan youth

Context

In 2008, there were 235,842 child maltreatment investigations in Canada and 85,400 (36%) of these investigations substantiated the maltreatment claim.¹ A 2003 analysis of child intervention service agencies across Canada found the rates of maltreatment investigations resulting in children and youth being taken into care were much higher for Aboriginal children (16%) compared to non-Aboriginal children (7%).²

Maltreatment stems from a complex interplay of individual, relationship, society and community factors.³ Factors associated with maltreatment include recent life stressors, family conflict, substance abuse, low maternal education level, low socio-economic status and maternal mental health problems.⁴ Neglect is the main reason Aboriginal children enter the child protection system and this can be linked to conditions of poverty, inadequate housing and substance abuse.²

The Public Health Agency of Canada reported that outcomes for a child or youth who experiences maltreatment are influenced by the type, severity, frequency and duration of the maltreatment, as well as the age at which maltreatment occurs. Maltreatment can harm physical and psychological well-being, and can affect academic performance.⁴

Factors such as personal resiliency and access to protective adults, health services, education, and social services have been shown to protect children and youth from the negative effects of maltreatment.⁴

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

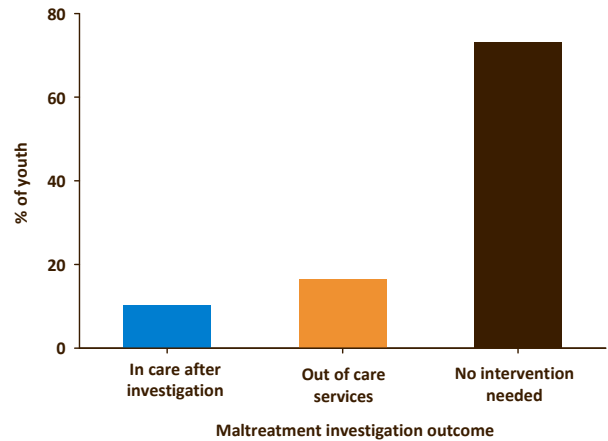

Maltreatment-related investigations among Albertan youth

Maltreatment related investigation outcome (Table 1)

These analyses look at Albertan youth (aged 12 to 17 years) who were the subject of a maltreatment-related investigation in 2008/09.

- 7,029 youth (2% of 307,703 youth aged 12 to 17 years) were the subject of a maltreatment-related investigation by child intervention services.
- 73% of maltreatment-related investigations resulted in *no intervention needed*, 17% resulted in youth receiving services in the parental home (*out of care services*) and 10% resulted in youth receiving services outside the parental home (*in care after investigation*).

Maltreatment investigation outcome
Albertan youth aged 12 to 17 investigated for maltreatment

Aboriginal status
Albertan youth aged 12 to 17 investigated for maltreatment

Aboriginal status of youth who were the subject of a maltreatment investigation (Table 2)

The Aboriginal status of youth who were not the subject of a maltreatment-related investigation in 2008/09 was not available for this project.

- 29% of youth who underwent a maltreatment-related investigation were Aboriginal. The remainder were non-Aboriginal (71%).

Aboriginal status by maltreatment investigation outcome (Table 3)

- The majority of maltreatment-related investigations resulted in *no intervention needed* for both Aboriginal (68%) and non-Aboriginal youth (75%).
- The maltreatment-related investigation outcome was more likely to result in receipt of *in care* services for Aboriginal youth (15%) than for non-Aboriginal youth (9%).
- Percentage of investigations resulting in *out of care* services was similar for Aboriginal (18%) and non-Aboriginal youth (16%).

Aboriginal status by maltreatment investigation outcome
Albertan youth aged 12 to 17

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by age (Tables 4 and 5)

Maltreatment investigation outcome by age
Albertan youth aged 12 to 17

- The percentage of youth who came *into care* as a result of investigation was highest for youth aged 15 years old (13%).
- The percentage of youth who received *out of care services* was highest for youth aged 17 years, compared to any other age.
- There was no difference across age in the percentage of youth who were Aboriginal (graph not shown).

Maltreatment investigation outcome by gender (Tables 6 and 7)

- Females (53%) were more likely than males (47%) to be the subject of a maltreatment-related investigation.
- Female Aboriginal youth were slightly more likely (55%) than male Aboriginal youth (53%) to be the subject of a maltreatment-related investigation (graph not shown).

Maltreatment investigation outcome by gender
Albertan youth aged 12 to 17

Maltreatment investigation outcome by region of residence
Albertan youth aged 12 to 17

Maltreatment investigation outcome by region of residence (Table 8)

- The majority of maltreatment-related investigations occurred in large centres (Edmonton and Calgary).
- A larger percentage of youth whose investigations led to *in care* services were from rural regions (30%) than *out of care services* (23%), *no intervention needed* (25%), and youth not investigated (23%).
- Youth whose investigation led to *out of care services* were the most likely to be from large centres (64%).

Maltreatment-related investigations among Albertan youth

Aboriginal status by region of residence (Table 9)

- 32% of Aboriginal youth and 23% of non-Aboriginal youth who were the subject of a maltreatment-related investigation were from rural areas.

Aboriginal status by region of residence
Albertan youth aged 12 to 17 investigated for maltreatment

Maltreatment investigation outcome by socio-economic status (SES)
Albertan youth aged 12 to 17

Maltreatment investigation outcome by socio-economic status (Table 10)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p.22).

- Youth who were the subject of a maltreatment-related investigation were more likely to be from the lowest socio-economic status neighbourhoods (39%) than youth who were not investigated (23%).

Aboriginal status by socio-economic status (Table 11)

- Among Aboriginal youth who were the subject of a maltreatment-related investigation, 47% were from the lowest socio-economic status neighbourhoods, compared to 36% of Non-Aboriginal youth.

Aboriginal status by socio-economic status (SES)
Albertan youth aged 12 to 17 investigated for maltreatment

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by educational achievement (Table 12)

This and the following analysis are limited to youth who were the subject of a maltreatment-related investigation and were registered in the K-12 education system in Alberta in 2008/09.

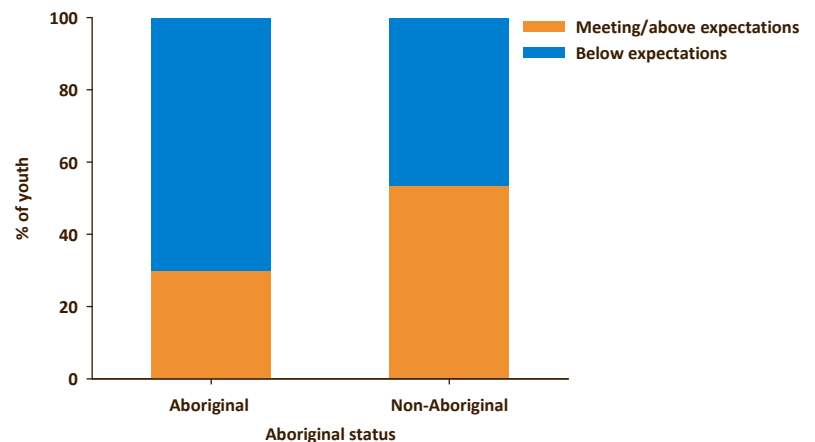

- Youth who were the subject of a maltreatment-related investigation were more likely to be performing below educational expectations than youth who had not been investigated, regardless of the investigation outcome.
- Youth whose investigation outcome led to *in care* services were least likely to have met or exceeded educational expectations (36%). In contrast, 45% of youth receiving services *out of care*, 50% of youth *not requiring intervention* and 83% of youth who were not the subject of a maltreatment investigation met or exceeded educational expectations.

Aboriginal status by educational achievement (Table 13)

Aboriginal status was determined by Human Services records only. Comparisons between Aboriginal and non-Aboriginal students should be interpreted with caution, because no data were available for students who attended schools on First Nations reserves.

- Among youth who were the subject of a maltreatment-related investigation, 30% of Aboriginal youth and 53% of non-Aboriginal youth met or exceeded educational expectations.

Aboriginal status by educational achievement Albertan youth aged 12 to 17 investigated for maltreatment

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by mental health status (Table 14)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.23).

- Service use for mental health conditions was more than twice as likely among youth who were the subject of a maltreatment-related investigation (27% of youth investigated, 1,610 youth) than among youth who were not investigated (9% of youth not investigated, 23,832 youth). This may be partially due to increased access to mental health services for youth who are the subject of a maltreatment-related investigation.
- Youth whose investigation outcome led to *in care* services had the highest rate of service use for mental health conditions (44%), followed by 31% for youth receiving *out of care services* and 23% for the *no intervention needed* group.

Aboriginal status by mental health service use Albertan youth aged 12 to 17 investigated for maltreatment

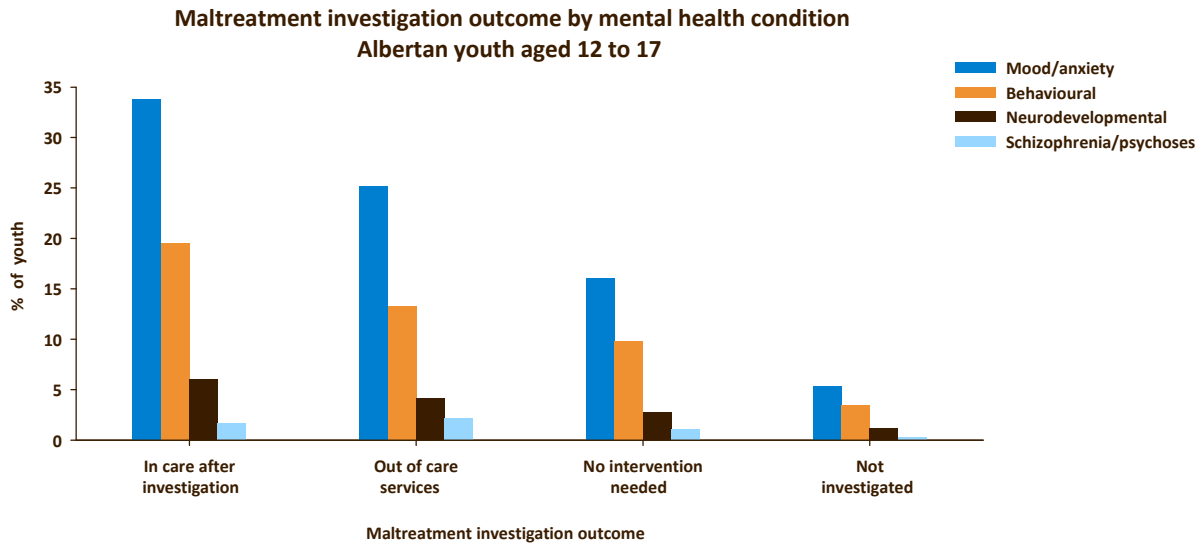

Aboriginal status by mental health status (Table 15)

- Service use for mental health conditions was more common among non-Aboriginal youth (30%) than Aboriginal youth (22%) who were the subject of a maltreatment-related investigation.

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by mental health condition (Table 16)

- *Mood/anxiety, behavioural and neurodevelopmental* mental health conditions were more common among youth who were the subject of a maltreatment-related investigation than among youth not investigated, with the highest rates of mental health conditions among youth who entered *in care after investigation*.
- *Schizophrenia/psychoses* conditions were slightly more common among youth whose investigation outcome led to *out of care services* (2.2%) than *in care after intervention* (1.7%) and *no intervention needed* (1.1%).

Aboriginal status by mental health condition

Albertan youth aged 12 to 17 investigated for maltreatment

Aboriginal status by mental health condition (Table 17)

- All four types of mental health conditions were more common among non-Aboriginal than Aboriginal youth who were the subject of an investigation.

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by health service use (Table 18)

- Youth who experienced an investigation which resulted in the receipt of *in care* services were most likely to visit an emergency room, be hospitalized, or visit physicians five or more times, followed by youth who received *out of care* services after an investigation, and youth whose investigation outcome led to *no intervention needed*.
- Youth not investigated were more likely to have one to four physician visits than any other group.
- Youth whose investigation outcome led to *no intervention needed* were more likely to have no health service use compared to the other groups.

Aboriginal status by health service use (Table 19)

- Aboriginal youth who were the subject of an investigation were slightly more likely to have one to four physician visits, to have an emergency room visit, or to be hospitalized at least once, compared to non-Aboriginal youth who were the subject of an investigation.
- Among youth who were the subject of an investigation, non-Aboriginal youth were more likely to have five or more physician visits (26%) than Aboriginal youth (18%).

Maltreatment-related investigations among Albertan youth

Maltreatment investigation outcome by cross-service use (Table 20)

This analysis and the next one look at the cross-ministry service use of youth (aged 12 to 17 years) by maltreatment investigation outcome. Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p.23). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP. 14% of youth who were the subject of a maltreatment investigation were not registered with AHCIP.

- Youth who were *in care after investigation* were most likely of the four groups to be enrolled in Alberta's K-12 education system, to receive Family Support for Children with Disability program services, to be charged with an offence, or to be involved with correctional services than all other youth.

Maltreatment-related investigations among Albertan youth

Aboriginal status by cross-service use (Table 21)

- Aboriginal youth who were the subject of a maltreatment-related investigation were more likely to have been charged with offences and involved with correctional services than non-Aboriginal youth who were investigated.
- Aboriginal youth who were the subject of a maltreatment-related investigation were less likely to receive support from the Family Support for Children with Disability (FSCD) program or to be enrolled in Alberta’s off-reserve K-12 education system compared to non-Aboriginal youth.
- These results need to be interpreted with caution as youth enrollment data for on-reserve schools were not available.

Maltreatment-related investigations among Albertan youth

Tables

Table 1. Number and percent of youth who were the subject of a maltreatment-related investigation, Albertan youth aged 12 to 17 years, 2008/09

	Maltreatment investigation outcome	Total
Number of youth	In care after investigation	726
	Out of care services	1,157
	No intervention needed	5,146
	Any maltreatment investigation	7,029
	Not investigated	300,674
	Total Albertan youth (aged 12 to 17)	307,703
Percent of youth	In care after investigation	0.2
	Out of care services	0.4
	No intervention needed	1.7
	Any maltreatment investigation	2.3
	Not investigated	97.7
	Total Albertan youth (aged 12 to 17)	100.0
Percentage of youth investigated for maltreatment	In care after investigation	10.3
	Out of care services	16.5
	No intervention needed	73.2
	Any maltreatment investigation	100.0

Table 2. Number and percent of youth who were the subject of a maltreatment-related investigation by Aboriginal status, Albertan youth aged 12 to 17 years, 2008/09

	Aboriginal status	Total investigated
Number of youth	Aboriginal	2,007
	Non-Aboriginal	5,022
	Any maltreatment investigation	7,029
Percent of youth	Aboriginal	28.6
	Non-Aboriginal	71.4
	Any maltreatment investigation	100.0

Maltreatment-related investigations among Albertan youth

Maltreatment-related investigations among Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Maltreatment-related investigations among Albertan youth

Definitions and Notes (continued)

Mental health status was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.

- **Mental health conditions** were grouped based on The Johns Hopkins ACG[®] Case-Mix System (version 8.2)⁶. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Maltreatment-related investigations** occur when there is a concern that the safety or well-being of a youth is threatened. Outcomes of investigation include *in care after investigation* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), *out of care services* (the youth remains in the home and the family receives support services), and *no intervention needed*. Youth self-identified or were identified by a parent or guardian as Aboriginal or non-Aboriginal.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.).
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the "**health registry**" refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.

Maltreatment-related investigations among Albertan youth

Maltreatment-related investigations among Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFR). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Maltreatment-related intervention services received by Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report provides a profile of 6,400 Albertan youth (aged 12 to 17 years) who received intervention services in 2008/09 as a result of maltreatment. Depending on the situation, intervention services may be provided while the youth remains in the home (*out of care services*), or the youth may have to be removed from the home and placed *in care* because of ongoing and serious safety concerns.

Youth are described in terms of the type of intervention services they received and their Aboriginal status, by age, gender, region of residence, socio-economic status, educational achievement, mental health status and health service use. They are compared with youth not receiving intervention services. The report also provides an overview of cross-ministry service use for youth receiving intervention services.

- 2.1% of Albertan youth received intervention services; of these 62% were *in care*, and almost half were Aboriginal.
- Compared to youth not receiving intervention services, youth who received intervention services were more likely to live in the lowest socio-economic status neighbourhoods, to perform below educational expectations, to have a mental health condition (particularly mood or behavioural conditions), or to have five or more physician visits, an emergency room visit, or a hospitalization.
- Compared to youth not receiving interventions, youth receiving intervention services for maltreatment were over-represented in Family Support for Children with Disabilities (FSCD) and the justice and correctional systems, and were slightly more likely to be in the K-12 education system.
- Among youth receiving intervention services, Aboriginal youth were more likely to be *in care*, living in rural settings or the lowest socio-economic status neighbourhoods, or performing below educational expectations compared to non-Aboriginal youth. Aboriginal youth were also less likely to have received services for a mental health condition, to have had five or more physician visits, and were slightly less likely to be hospitalized.
- Aboriginal youth receiving intervention services were less likely to be receiving FSCD services or to be registered in the K-12 education system than non-Aboriginal youth.

Maltreatment-related intervention services received by Albertan youth

Context

Rates of maltreatment of children and youth in Canada are not minimal. Canadian data indicate a rate of 14.2 substantiated cases of maltreatment for every 1,000 children and youth. Rates are higher for infants and young children than for adolescents.¹ Aboriginal children and youth are over-represented in child intervention systems.²

Maltreatment stems from a complex interplay of individual, relationship, society and community factors.³ Factors associated with maltreatment include recent life stressors, family conflict, substance abuse, low maternal education level, low socio-economic status and maternal mental health problems.⁴ Neglect is the main reason Aboriginal children enter the child protection system and this can be linked to conditions of poverty, inadequate housing and substance abuse.²

Maltreated youth's physical and mental well-being can be affected, often in the long-term. There is increased risk for "violent victimization and the perpetration of violence, depression, smoking, obesity, high-risk sexual behaviours, unintended pregnancy, and alcohol and drug use"⁵ among those who have been maltreated.

Societal costs associated with maltreatment-related interventions are high, including provision of related services, health care costs, lost earnings and productivity, costs of criminal actions, and incarceration.³ Rates of children and youth who are taken into care and who have complex needs resulting from circumstances such as fetal alcohol spectrum disorder, exposure to parental substance abuse, substantial health needs, or involvement in the justice system, have been increasing. Some estimates suggest 50-60% of children and youth taken into care require additional resources to deal with issues such as these.⁶

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Maltreatment-related intervention services received by Albertan youth

Type of intervention (Table 1)

These analyses look at Albertan youth (aged 12 to 17 years) who were receiving intervention services in 2008/09 as a result of maltreatment by type of intervention service.

- 6,400 youth were receiving intervention services as a result of maltreatment, representing 2.1% of 307,703 Albertan youth (aged 12 to 17 years).
- 62% of youth receiving intervention services were receiving *in care services* and 38% were receiving services while at home with their parents or guardians (*out of care services*).

Type of intervention services
Albertan youth aged 12 to 17

Aboriginal status
Albertan youth aged 12 to 17 receiving intervention services

Aboriginal status of youth receiving intervention services (Table 2)

The Aboriginal status of youth in the general population not receiving intervention services in 2008/09 was not available for this project.

- 46% of youth who were receiving intervention services as a result of maltreatment were Aboriginal. The remainder, 54%, were non-Aboriginal.

Aboriginal status by type of intervention (Table 3)

- Aboriginal youth receiving intervention services were more likely to be receiving *in care services* (75%) than non-Aboriginal youth (51%) receiving intervention services.

Aboriginal status by type of intervention service
Albertan youth aged 12 to 17

Maltreatment-related intervention services received by Albertan youth

Type of intervention service by age
Alberta youth aged 12 to 17

Type of intervention by age (Table 4 and 5)

- Among those receiving intervention services *in care services* were slightly more common than *out of care services* (range 55-65%).
- The percentage of youth receiving intervention services who were Aboriginal varied from 43% to 49%, with younger youth being slightly more likely to be Aboriginal (graph not shown).

Intervention status by gender (Table 6 and 7)

- Females were slightly more likely (52%) than males to receive *out of care services*, but there were slightly fewer females (48%) than males among youth receiving *in care services*.
- Among those receiving intervention services, there was no difference in the ratio of males to females for Aboriginals compared to non-Aboriginals (graph not shown).

Intervention status by gender
Albertan youth aged 12 to 17

Intervention status by region of residence
Albertan youth aged 12 to 17

Intervention status by region of residence (Table 8 and 9)

- Region of residence varied little across type of intervention service.
- Aboriginal youth receiving intervention services were more likely to live in rural areas (36%) compared to non-Aboriginal youth receiving intervention services (18%) (graph not shown).

Maltreatment-related intervention services received by Albertan youth

Intervention status by socio-economic status (Table 10)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p.26).

- 23% of youth not receiving intervention services lived in the lowest socio-economic status neighbourhoods, compared with 43% of youth *in care* and 44% of those receiving *out of care* services.
- 9% of youth *in care* and 6% of youth receiving *out of care* services lived in the highest socio-economic neighbourhoods, compared with 21% of youth not receiving interventions.

Intervention status by socio-economic status (SES)
Albertan youth aged 12 to 17

Aboriginal status by socio-economic status (SES)
Albertan youth aged 12 to 17 receiving intervention services

Aboriginal status by socio-economic status (Table 11)

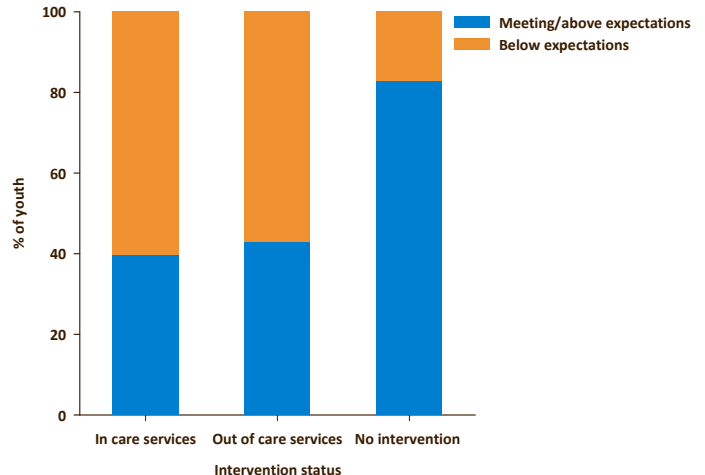

- Of youth receiving intervention services, 48% of Aboriginal youth and 40% of non-Aboriginal youth lived in the lowest socio-economic status neighbourhoods.

Intervention status by educational achievement (Table 12 and 13)

This and the following analysis are limited to youth who received maltreatment-related intervention services and were registered in the K-12 education system in 2008/09.

- Youth receiving intervention services were less likely to meet or exceed expectations in school.
- 41% of youth receiving intervention services (40% of those receiving *in care services* and 43% of those receiving *out of care services*) met or exceeded educational expectations, in contrast to 83% of youth not receiving intervention services.

Intervention status by educational achievement
Albertan youth aged 12 to 17

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by type of intervention service and educational achievement
Albertan youth aged 12 to 17

Aboriginal status by type of intervention service and educational achievement (Table 14)

Aboriginal status was determined by Human Services records only. Comparisons between Aboriginal and non-Aboriginal students should be interpreted with caution, because no data were available for students who attended schools on First Nations reserves.

- Aboriginal youth who received *in care* services were more likely to meet or exceed educational expectations (35%) than Aboriginal youth who received *out of care* services (28%). The reverse was observed for non-Aboriginal youth.

Intervention type by socio-economic status and educational achievement (Table 15)

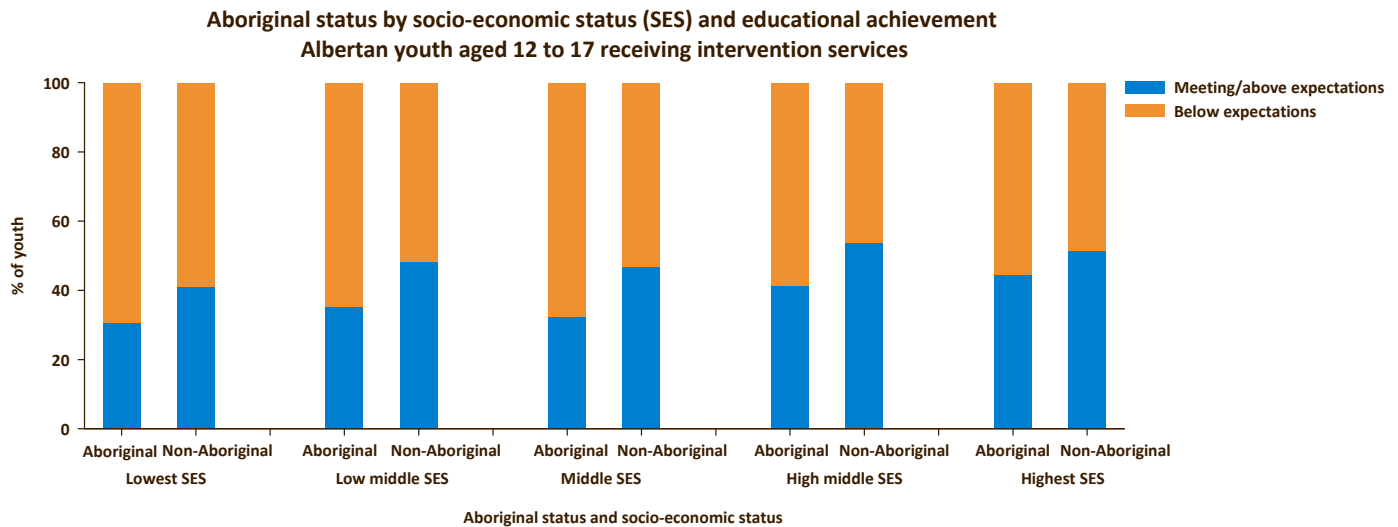

Type of intervention service by socio-economic status (SES) and educational achievement
Albertan youth aged 12 to 17

- Youth receiving *out of care services* were more likely to have met or exceeded educational expectations than youth receiving *in care services*, among youth who lived in low middle, middle and high middle socio-economic neighbourhoods.
- No difference in educational achievement was observed between youth receiving *in care* and *out of care services* if they lived in the lowest or the highest socio-economic status neighbourhoods.

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by socio-economic status and educational achievement (Table 16)

Aboriginal status was determined by Human Services records only. Comparisons between Aboriginal and non-Aboriginal students should be interpreted with caution, because no data were available for students who attended schools on First Nations reserves.

- Across all socio-economic groups, Aboriginal youth attending off-reserve schools were less likely to meet or exceed educational expectations than non-Aboriginal youth in the same socio-economic group.
- The difference between Aboriginal youth and non-Aboriginal youth in the percentage of youth who met or exceeded educational expectations was greater than 10% across all socio-economic status groups, except among those who lived in the highest socio-economic status neighbourhoods, where the difference was 7%.

Intervention status by mental health status (Table 17)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes (p.27)*.

- Service use for mental health conditions was far more common among youth receiving intervention services than youth not receiving intervention. This may be partially due to increased access to mental health services for youth receiving intervention services.

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by mental health service use
Albertan youth aged 12 to 17 receiving intervention services

Aboriginal status by mental health status
(Table 18)

- Non-Aboriginal youth receiving intervention services had higher service use for mental health conditions (41%) compared to Aboriginal youth receiving intervention services (35%).

Intervention status by mental health condition (Table 19)

- Service use for all types of mental health conditions was most common among youth who were *in care*, followed by youth receiving *out of care services*. Rates were much lower in youth with no interventions.
- Among youth *in care* and those receiving *out of care services*, *mood/anxiety* (28% and 23%, respectively) and *behavioural* (22% and 13%, respectively) conditions were most common. The rates for *mood/anxiety* and *behavioural* conditions were 5% and 3%, respectively, among youth not receiving intervention.

Intervention status by mental health condition
Albertan youth aged 12 to 17

Aboriginal status by mental health condition
Albertan youth aged 12 to 17 receiving intervention services

Aboriginal status by mental health condition
(Table 20)

- *Mood and/or anxiety* conditions were more common among non-Aboriginal youth (29%) than Aboriginal youth (22%) receiving intervention services.

Maltreatment-related intervention services received by Albertan youth

Intervention type by mental health status and educational achievement (Table 21)

- Youth who accessed services for a mental health condition were less likely to meet or exceed educational expectations, regardless of the type of intervention service they received, than those who had not accessed services for any mental health condition.

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by mental health status and educational achievement (Table 22)

Aboriginal status was determined by Human Services records only. Comparisons between Aboriginal and non-Aboriginal students should be interpreted with caution, because no data were available for students who attended schools on First Nations reserves.

- Aboriginal youth accessing services for a mental health condition were less likely to have met or exceeded educational expectations (29%) than non-Aboriginal youth (36%).
- Over half (53%) of non-Aboriginal youth with no service use for a mental health condition met or exceeded educational expectations.

Intervention status by health service use
Albertan youth aged 12 to 17

Intervention status by health service use
(Table 23)

- Five or more physician visits were more common among youth who received *in care services* (39%).
- Youth who received *out of care services* were slightly more likely to have had an emergency room visit or been hospitalized than youth who received *in care services*.
- Youth who had not received intervention services were more likely to have one to four physician visits.

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by health service use (Table 24)

- Among youth receiving intervention services, Aboriginal youth were more likely than non-Aboriginal youth to have one to four physician visits, whereas non-Aboriginal youth were more likely to have five or more physician visits.
- Aboriginal youth receiving intervention services were more likely to have no health service use than non-Aboriginal youth.

Intervention status by cross-service use (Table 25)

This analysis looks at the cross-ministry service use of youth (aged 12 to 17 years) by type of maltreatment intervention service received. Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes, p.28*). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP. 7% of youth who received maltreatment-related intervention services were not registered with AHCIP.

- Youth receiving intervention services were more likely to have offence charges or involvement with correctional services or with Family Support for Children with Disabilities (FSCD) in 2008/09 than those who did not receive intervention services.

Maltreatment-related intervention services received by Albertan youth

Aboriginal status by cross-service use (Table 26)

- 85% of non-Aboriginal youth and 72% of Aboriginal youth receiving intervention services were registered in Alberta’s K-12 education system (off-reserve schools only), compared with 78% of youth not receiving interventions.
- There were minimal differences between Aboriginal and non-Aboriginal youth in terms of having offence charges or being involved with correctional services.
- 5% of non-Aboriginal youth were receiving services from FSCD, compared to 2% of Aboriginal youth.

Maltreatment-related intervention services received by Albertan youth

Tables

Table 1. Number and percent of youth by maltreatment intervention status, Albertan youth aged 12 to 17 years, 2008/09

	Maltreatment intervention status	Total
Number of youth	In care services	3,956
	Out of care services	2,444
	Any maltreatment intervention services	6,400
	No maltreatment intervention services	301,303
	Total Albertan youth aged 12 to 17 years	307,703
Percent of Alberta youth	In care services	1.3
	Out of care services	0.8
	Any maltreatment intervention services	2.1
Percent of youth receiving intervention	In care services	61.8
	Out of care services	38.2
	Total	100.0

Table 2. Number and percent of youth by Aboriginal status of youth receiving maltreatment intervention services, Albertan youth aged 12 to 17 years, 2008/09

	Aboriginal status	Total
Number of youth	Aboriginal receiving maltreatment intervention services	2,930
	Non-Aboriginal receiving maltreatment intervention services	3,470
	Any maltreatment intervention services	6,400
	No maltreatment intervention services	301,303
	Total Albertan youth aged 12 to 17 years	307,703
Percent of Alberta youth	Aboriginal receiving maltreatment intervention services	1.0
	Non-Aboriginal receiving maltreatment intervention services	1.1
	Any maltreatment intervention services	2.1
Percent of youth receiving intervention	Aboriginal	45.8
	Non-Aboriginal	54.2
	Total	100.0

Maltreatment-related intervention services received by Albertan youth

Definitions and notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁷. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Maltreatment-related intervention services received by Albertan youth

Definitions and notes (continued)

Mental health status was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.

- **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁸. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services). Youth self-identified or were identified by a parent or guardian as Aboriginal or non-Aboriginal.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.).
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).

Maltreatment-related intervention services received by Albertan youth

Definitions and Notes (continued)

- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.

Maltreatment-related intervention services received by Albertan youth

Maltreatment-related intervention services received by Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Physician visits by Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report is an overview of 2,361,770 physician visits by 496,787 Albertan youth (12 to 24 years) in 2008/09. Physicians were grouped into two types of providers: specialists and general practitioners. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The report contains analyses of the relationships between number of physician visits as well as type of physician with region of residence, socio-economic status, age, gender, educational achievement and mental health status. The cross-ministry service use of youth who visited physicians was also described.

- 49% of youth had one to four physician visits and 26% had five or more physician visits, while 24% of youth had no physician visits. 64% of visits were with a general practitioner and 36% were with a specialist.
- Number of physician visits increased with age for females and decreased with age for males. Youth who were performing above educational expectations or who received services for a mental health condition were more likely to visit a physician.
- About two thirds of visits were to general practitioners; visits to specialists were less common among visits for older youth and females. Visits to specialists were more common among visits by youth who were performing above educational expectations than those below, or among those who had *neurodevelopmental* or *schizophrenia/psychoses* conditions than those with other mental health conditions.
- Socio-economic status and region of residence were unrelated to number of physician visits or to provider types.
- Making five or more physician visits in the study year was more common for youth on income support, youth receiving Family Support for Children with Disabilities services, youth who received maltreatment-related intervention services, and youth who were enrolled in a post-secondary institution, compared to the whole population of youth registered with Alberta Health Care.

Physician visits by Albertan youth

Context

Adolescence and early adulthood is a time during which youth develop many of the lifestyle patterns they will follow throughout adulthood, including behaviours that enhance health as well as those that are detrimental to health. Making regular (but not frequent) visits to a primary care physician is a behaviour that is associated with better overall health.¹

A survey of the health care utilization of Canadian youth aged 12 to 19 years showed that physician visits were more likely for females, older adolescents, youth from single parent families, youth with lower health status or disability, youth with higher rates of distress, and youth whose lifestyle practices compromised health.²

In another survey on physician visits by Canadian youth 12 to 24 years old, the effect of age group was studied. The average number of visits in the previous year increased with increasing age, from 1.9 visits for 12 to 14 year olds to 2.4 for 15 to 19 year olds to 2.8 for 20 to 24 year olds. Similarly, the percentage of youth who were high users (4 or more visits in the past year) increased with increasing age group (14.5, 19.0, and 21.7% for the three age groups, respectively). The youngest male and female youth were equally likely to use physician services, while among older youth, females were more likely than males to visit a physician³.

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Physician visits by Albertan youth

Number of physician visits (Table 1)

This and the following analyses consider youth (aged 12 to 24 years, unless otherwise stated) who were registered with the Alberta Health Care Insurance Plan at any point in 2008/09. See *Definitions and Notes* (p. 20).

- The number of physician visits was analyzed for 655,758 youth.
- 496,787 of youth had one or more physician visits, representing 76% of Albertan youth.
- 49% of youth had one to four physician visits and 26% had five or more physician visits. 24% of youth had no physician visits.

Provider type (Table 2)

In all analyses in this report for provider type, all physician visits are counted, including multiple visits for a given youth.

- There were a total of 2,361,770 physician visits made by 496,787 youth.
- 64% of visits were with a general practitioner and 36% were with a specialist.

Physician visits by Albertan youth

Number of physician visits by age and gender (Tables 3 and 4)

- Female youth had an increasing rate of high physician visits (five or more) with increasing age. This may be due to use of physician services for prenatal visits in females aged 18 to 24 years.³
- For males, the rate of five or more visits was steady at around 20% of males from 12 to 17 years of age. At age 18, a sharp decrease in physician visits was observed for males. This is consistent with past findings of decreased use physician services by males in adulthood.³

Proportion of visits to specialists by age Albertan youth aged 12 to 24

Specialist visits by age (Table 5)

- The percentage of visits to specialists decreased with increasing age.
- Almost half of all visits for youth aged 12 to 15 were with a specialist, whereas less than a third of visits among youth aged 20 to 24 were with a specialist.

Physician visits by Albertan youth

Provider type by gender (Table 6)

- 33% of visits by females were with specialists.
- 41% of visits by males were with specialists.

Number of physician visits by region of residence
Albertan youth aged 12 to 24

Number of physician visits by region of residence (Table 7)

- Number of physician visits did not vary much by region of residence.
- Youth living in rural regions were slightly more likely to have no physician visits (26%) than youth living in large centres (23%).

Provider type by region of residence (Table 8)

- The percentage of visits with specialists did not vary by region of residence.
- Approximately one third of visits were with specialists among visits by youth living in rural regions (36% of visits), mid-sized centres (36%), and large centres (36%).

Provider type by region of residence
Visits made by Albertan youth aged 12 to 24

Physician visits by Albertan youth

Number of physician visits by socio-economic status
Albertan youth aged 12 to 24

Number of physician visits by socio-economic status (Table 9)

Socio-economic status captures the social and material environments in which youth live. Only the highest and lowest socio-economic status groups are shown in this and the following analysis. See *Definitions and Notes* (p. 19).

- Youth living in the lowest socio-economic status neighbourhoods were slightly more likely to have no physician visits (26%) compared to youth living in the highest socio-economic status neighbourhoods (22%).

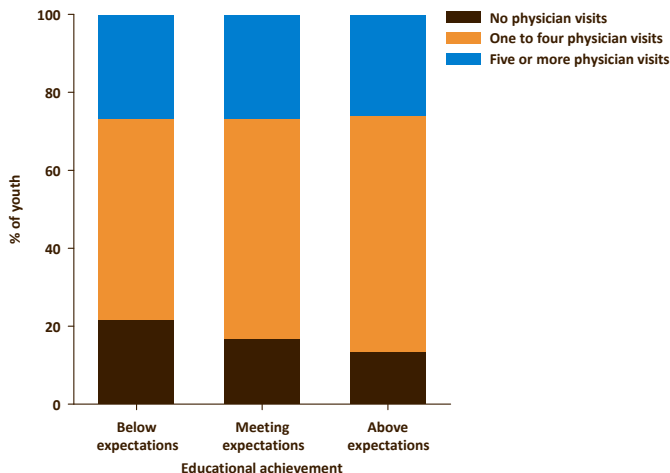

Provider type by socio-economic status (Table 10)

- The percentage of visits with specialists and general practitioners was similar in the highest and lowest socio-economic status areas.

Provider type by socio-economic status
Visits made by Albertan youth aged 12 to 24

Number of physician visits by educational achievement
Albertan youth aged 12 to 20

Number of physician visits by educational achievement (Table 11)

Youth (12 to 20 years) who were enrolled in the K-12 education system in 2008/09 are included in this and the following analysis. See *Definitions and Notes* (p. 19).

- Youth who were performing below educational expectations accessed physicians less often than youth who were meeting or achieving above expectations.
- 22% of youth performing below expectations had no physician visits, compared to 17% of youth meeting expectations and 14% of youth achieving above expectations.

Physician visits by Albertan youth

Provider type by educational achievement (Table 12)

- Visits for youth who were exceeding educational expectations were equally likely to be with general practitioners and specialists.
- 50% of visits for youth who were achieving above educational expectations were with specialists. This percentage was slightly lower for youth who were below (40%) or meeting expectations (44%).

Number of physician visits by mental health status
Albertan youth aged 12 to 24

Number of physician visits by mental health status (Table 13)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 20).

- Youth with a mental health condition were markedly more likely to have a high number of physician visits (62%) compared to youth with no mental health condition (23%) which may be partially due to how mental health status was defined.

Provider type by mental health status (Table 14)

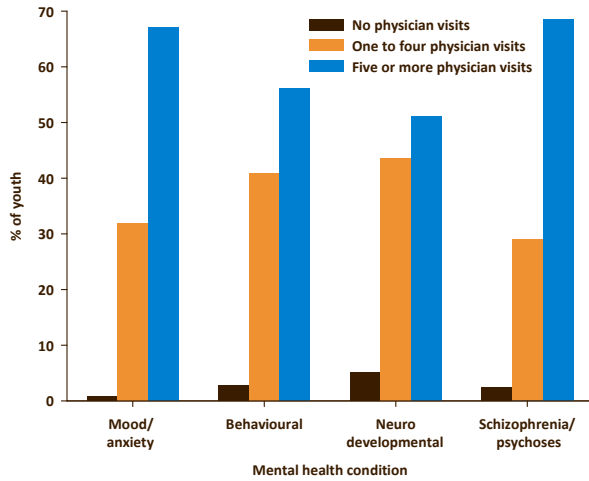

- The percentage of specialist visits by youth with a mental health condition was not different than the percentage of specialist visits by youth with no mental health condition.

Provider type by mental health status
Visits made by Albertan youth aged 12 to 24

Physician visits by Albertan youth

Number of physician visits by mental health condition
Albertan youth aged 12 to 24

Number of physician visits by mental health condition (Table 13)

- Youth with *mood/anxiety* (67%) or *schizophrenia/psychoses* (69%) conditions were more likely to have five or more physician visits than youth with *behavioural* (56%) or *neurodevelopmental* (51%) conditions.

Provider type by mental health condition (Table 14)

- The percentage of visits to specialists varied with mental health condition.
- 33% of visits by youth with a *mood/anxiety* condition were with a specialist, compared to 42% of visits by youth with *behavioural* conditions, 59% of visits by youth with *neurodevelopmental* conditions, and 59% of visits by youth with *schizophrenia/psychoses* conditions.

Provider type by mental health condition
Visits made by Albertan youth aged 12 to 24

Physician visits by Albertan youth

Number of physician visits by cross-service use (Table 15)

Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p. 20). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP.

- A high rate of five or more physician visits was observed for youth receiving income support (50%), youth receiving serviced from the Family Support for Children with Disabilities (FSCD) program (47%), youth who received maltreatment-related intervention services (38%), and youth who were enrolled in a post-secondary institution (32%).
- 26% of all youth registered with the Alberta Health Care Insurance Plan had five or more physician visits.

Physician visits by Albertan youth

Provider type by cross-service use (Table 16)

- The percentage of visits to specialists was high among visits by youth who received support from FSCD (66% of visits), visits by youth who received maltreatment-related investigation services (46%), and visits by youth enrolled in the K-12 education system (44%).
- 36% of visits by all youth in the Alberta Health Care Insurance Plan were to specialists.
- Visits made by youth on income support or visits by youth enrolled in a post-secondary institution were mostly to general practitioners (71% and 70% of visits, respectively).

Physician visits by Albertan youth

Tables

Table 1. Number and percent of youth by number of physician visits and age group, Albertan youth aged 12 to 24 years, 2008/09

	Number of physician visits	Age group (years)					
		12 to 17	12 to 18	12 to 20	17 to 24	18 to 24	12 to 24
Number of youth	One to four visits	157,466	182,732	230,362	191,229	165,979	323,445
	Five or more visits	67,861	82,393	110,502	120,112	105,481	173,342
	Any visit	225,327	265,125	340,864	311,341	271,460	496,787
	No visits	59,804	69,752	96,648	108,418	99,167	158,971
	Total	285,131	334,877	437,512	419,759	370,627	655,758
Percent of youth	One to four visits	55.2	54.6	52.7	45.6	44.8	49.3
	Five or more visits	23.8	24.6	25.3	28.6	28.5	26.4
	Any visit	79.0	79.2	77.9	74.2	73.2	75.8
	No visits	21.0	20.8	22.1	25.8	26.8	24.2

Physician visits by Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁴. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Physician visits by Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan or the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁵. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Physician visits** reflect fee claims made by physicians for services provided when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the "**health registry**" refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).

Physician visits by Albertan youth

Definitions and Notes (continued)

- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.

Physician visits by Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Emergency room visits by Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report is an overview of 326,685 visits to emergency rooms by 163,411 Albertan youth (aged 12 to 24) in 2008/09. Reasons for emergency room visits were derived from primary diagnostic codes. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The relationships between emergency room use and age, gender, region of residence, socio-economic status, educational achievement, and mental health status were analyzed, as was the cross-ministry service use of youth who visited emergency rooms.

- 15% of youth had a single emergency room visit and a further 10% had multiple emergency room visits. The most common reason for visit was *injury or poisoning*.
- The number of emergency room visits increased with age to about 19 years, then decreased. Females aged 16 and older were more likely to have multiple emergency room visits than males of those ages. Youth living in rural areas and those living in the lowest socio-economic status neighbourhoods had higher rates of emergency room use than those living in urban areas or in the highest socio-economic status areas. Performing above educational expectations and absence of a mental health condition were associated with lower rates of emergency room use.
- Visits for *injury or poisoning* were most likely for youth aged 12 to 20 while emergency room visits for *other* reasons were most likely for youth aged 21 to 24. Visits for males were most often for *injury or poisoning* whereas visits for females were most likely for *other* reasons. Visits by youth performing below educational expectations were more likely to be for *mental or behavioural* reasons and less likely to be for *injury or poisoning* than visits by youth meeting or above expectations.
- Youth receiving income support were most likely to make multiple emergency room visits and those enrolled in post-secondary education were least likely to do so. Single emergency room visits were most common among youth with offence charges or involved in corrections and least common among post-secondary students.

Emergency room visits by Albertan youth

Context

Emergency rooms are used for a variety of services in Canada. Most patients who visit emergency rooms are classified with neither life-threatening nor potentially life-threatening conditions, though they often require at least semi-urgent care.¹ In general, Canadians with more severe or chronic health problems are more likely to visit emergency rooms than those with fewer health problems,² and those who visit emergency rooms tend to be heavy users of other types of medical services.³ People who have consulted a medical professional about a mental health issue (in particular, mood or anxiety disorders) are more likely to use emergency rooms than those who have not.³

Statistics Canada reports that teenagers and young adults have the highest rates of emergency room visits among Canadians 15 years of age and older, reflecting high injury rates in these groups; male youth have slightly higher rates of use than females.³ Individuals in the lowest income groups are more likely to use emergency rooms than those in the highest income groups.^{3,4} Individuals with less than high school education are also more likely to use emergency rooms than those with high levels of education.⁴

Protective factors against visiting emergency rooms include post-secondary graduation and absence of chronic conditions or unmet health needs.³

In a 2005 study of health service utilization of Albertan children and youth, those who visited emergency rooms in Alberta were found to have an average of two visits.⁴ Among youth under 18 years of age who visited emergency rooms in Alberta between 2002 and 2007, there was an average of 1.5 visits per youth for mental health reasons during that six-year period. Mental health-related emergency room visit rates were lower in urban areas, which may be a function of greater availability of alternative resources in urban areas.⁵ Aboriginal youth and youth in families receiving income support were over-represented among youth visiting emergency rooms for mental health reasons.⁵

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Emergency room visits by Albertan youth

Number of emergency room visits (Table 1)

This and the following analyses consider youth (aged 12 to 24 years, unless otherwise stated) who were registered with the Alberta Health Care Insurance Plan at any point in 2008/09.

- 75% of youth (492,347 youth) registered with Health did not visit an emergency room in the study year.
- 15% of Alberta youth (95,017 youth) had a single emergency room visit and 10% of youth (68,394 youth) had multiple emergency room visits.

Reason for emergency room visit
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit (Table 2)

Analyses of reason for emergency room visit are based on all emergency room visits. See table below for examples of each reason and *Definition and Notes* (p. 19) for a description of coding.

- There were a total of 329,697 emergency room visits made by 163,411 youth.
- The most common reason for visiting an emergency room was for *injury or poisoning* (33%) followed closely by *other* reasons (28%).
- Fewer than 5% of emergency room visits were for mental or behavioural disorders.

Sample reasons for emergency room visits

Reason for emergency room visit	Examples
Injury/poisoning	Wound, fracture, sprain, allergy unspecified, etc.
Other	Non-infective gastroenteritis (including diarrhoea), urinary tract infections, lower back pain, etc.
Influencing factors	Cast removal, attention to surgical dressing and sutures, chemotherapy, etc.
Signs/symptoms	Headache, abdominal pain, chest pain, etc.
Respiratory	Sore throat, upper respiratory infection, asthma, etc.
Mental/behavioural	Depression, anxiety, mental and behavioural disorders due to use of alcohol or other drugs or psychoactive substances, etc.

Emergency room visits by Albertan youth

Number of emergency room visits by age and gender
Albertan youth aged 12 to 24

Number of emergency room visits by age and gender (Tables 3 and 4)

- The number of emergency room visits generally increased with age up to age 19 then decreased.
- Males were slightly more likely than females to have a single emergency room visit at each age.
- Females aged 16 and older were more likely to have multiple emergency room visits than males of those ages.

Reason for emergency room visit by age (Table 5)

- Visits for *injury or poisoning* were most likely for youth aged 12 to 20 while emergency room visits for *other* reasons were most likely for youth aged 21 to 24.
- Visits for *respiratory* conditions decreased slightly with age and visits for *influencing factors, signs/symptoms, and mental or behavioural* conditions increased slightly with age.

Reason for emergency room visit by age
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by gender
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by gender (Table 6)

- Visits by males were more likely to be for *injury or poisoning* than visits by females (44% versus 23% of visits respectively).
- Visits for *other* reasons were most common for females (35%)
- Visits for *signs or symptoms* were slightly higher among visits for females (15%) than among visits for males (9%).

Emergency room visits by Albertan youth

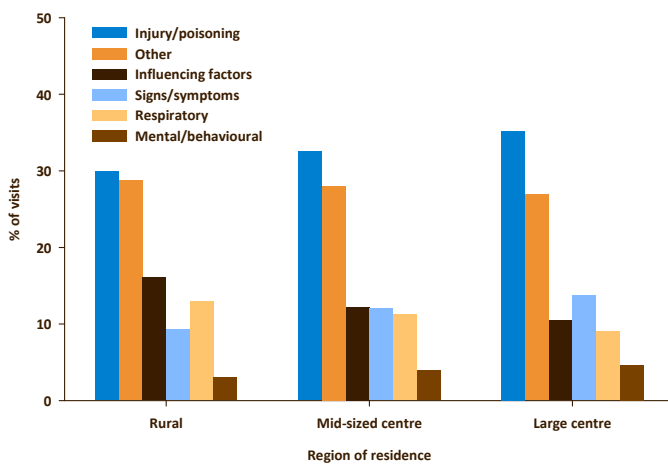

Number of emergency room visits by region of residence (Table 7)

- Youth living in rural regions were more likely to have one or multiple visits to emergency rooms than youth living in mid-sized or large centres.
- 18% of youth living in rural regions had multiple emergency room visits compared to 12% of youth living in mid-sized centres and 8% of youth living in large centres.

Number of emergency room visits by region of residence
Albertan youth aged 12 to 24

Reason for emergency room visit by region of residence
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by region of residence (Table 8)

- Visits for *injury or poisoning* were slightly higher in mid-sized centres (33% of visits) and large centres (35%) than in rural regions (30%).
- Visits by youth living in rural regions (16%) were more likely to be for *influencing factors* than visits by those in mid-sized (12%) or large centres (11%).

Number of emergency room visits by socio-economic status (Table 9)

Socio-economic status captures the social and material environments in which youth live. Only the highest and lowest socio-economic status groups are shown in this and the following analysis. See *Definitions and Notes* (p. 18).

- Youth living in the lowest socio-economic status neighbourhoods visited emergency rooms more frequently (single 16%, multiple 13%) than youth living in the highest socio-economic status areas (single 13%, multiple 8%).

Number of emergency room visits by socio-economic status
Albertan youth aged 12 to 24

Emergency room visits by Albertan youth

Reason for emergency room visit by socio-economic status
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by socio-economic status (Table 10)

- 37% of emergency room visits for youth living in the highest socio-economic status areas were for *injury or poisoning*, compared to the 32% of visits by youth living in the lowest socio-economic status neighbourhoods.
- Visits for *mental or behavioural* conditions did not vary by socio-economic status.

Number of emergency room visits by educational achievement (Table 11)

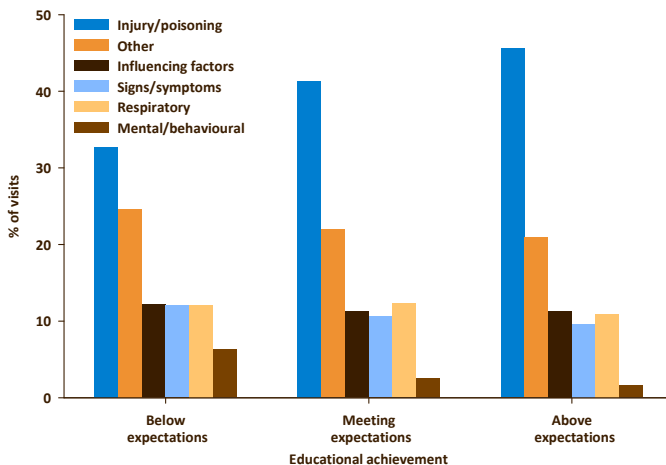

Youth (12 to 20 years) included in this and the following analysis are those who were enrolled in K-12 education system in 2008/09. See *Definitions and Notes* (p. 18).

- Youth who were achieving above educational expectations were less likely to use emergency rooms compared to those who were meeting or performing below expectations.
- 16% of youth performing below educational expectations had multiple emergency room visits compared to 10% of youth meeting expectations and 5% of youth achieving above expectations.

Number of emergency room visits by educational achievement
Albertan youth aged 12 to 20

Reason for emergency room visit by educational achievement
Visits made by Albertan youth aged 12 to 20

Reason for emergency room visit by educational achievement (Table 12)

- The percentage of visits for *injury or poisoning* was higher among visits for youth meeting (41%) or achieving above (46%) expectations than among visits for youth performing below expectations (33%).
- Visits for *mental or behavioural* problems (6%) were higher among visits for youth who were performing below expectations than among visits for youth who were meeting (3%) or achieving above (2%) expectations.

Emergency room visits by Albertan youth

Number of emergency room visits by mental health status (Table 13)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 19).

- Youth with a mental health condition were more likely to use emergency rooms than those without a mental health condition, which may be partially due to the method of defining mental health status (see *Definitions and Notes* p.19).

Number of emergency room visits by mental health status
Albertan youth aged 12 to 24

Reason for emergency room visit by mental health status
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by mental health status (Table 14)

- Visits for youth with a mental health condition were mostly for *other* reasons, while visits for youth with no mental health conditions were mostly for *injury or poisoning*.
- Visits for *mental or behavioural* conditions were substantially more frequent for youth with a mental health condition (17.3%) than for youth with no condition (0.1%). This result may be partially due to the method of defining mental health status (see *Definitions and Notes* p.19).

Number of emergency room visits by mental health condition (Table 13)

- Single emergency room visits were more common among youth with *mood or anxiety* disorders (20%), with *behavioural* conditions (21%), or with *schizophrenia/psychoses* (19%), than among youth with *neurodevelopmental* conditions (15%).
- Youth with *schizophrenia/psychoses* were most likely to have multiple emergency room visits.

Number of emergency room visits by mental health condition
Albertan youth aged 12 to 24

Emergency room visits by Albertan youth

Reason for emergency room visit by mental health condition
Visits made by Albertan youth aged 12 to 24

Reason for emergency room visit by mental health condition (Table 14)

- Visits by youth with *schizophrenia or psychoses* were most likely to be for *mental or behavioural* conditions (45%) than for any other reason.
- Visits for youth with *behavioural* mental health conditions were equally likely to be for *injury or poisoning* (26%) or for *mental or behavioural* conditions (26%).
- *Other* reasons for visits were most common among visits by youth with a *mood/anxiety* condition (27%).

Number of emergency room visits by cross-service use (Table 15)

Number of emergency room visits by cross-service use
Albertan youth aged 12 to 24

Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p. 19). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP.

- Youth on income support were most likely to have multiple emergency room visits. Youth enrolled in post-secondary education were the least likely to visit an emergency room.
- Emergency room visits were higher in youth who received maltreatment-related intervention services, or in youth with offence charges or corrections involvement, compared to all youth registered with AHCIP.

Emergency room visits by Albertan youth

Reason for emergency room visit by cross-service use (Table 16)

- The most common reason for youth visiting an emergency room was for *injury or poisoning* across most types of ministry services.
- Visits by youth receiving income support (33% of visits) were most likely to be for *other* reasons.
- Visits for *injury or poisoning* (30%) or for *other* reasons (32%) were equally common for youth enrolled in post-secondary education, and for youth receiving services from Family Support for Children with Disabilities (25%, 27% respectively).
- Visits for *mental or behavioural* conditions were substantially more likely among visits by youth with charges (13%), with corrections involvement (13%), receiving maltreatment-related intervention services (14%), on income support (10%), or receiving services from Family Support for Children with Disabilities (8%) than for visits by all youth registered in AHCIP (4%).

Emergency room visits by Albertan youth

Tables

Table 1. Number and percent of youth by number of emergency room (ER) visits and age group, Albertan youth aged 12 to 24 years, 2008/09

	Number of ER visits	Age group (years)					
		12 to 17	12 to 18	12 to 20	17 to 24	18 to 24	12 to 24

Emergency room visits by Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁶. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Emergency room visits by Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan or the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG[®] Case-Mix System (version 8.2)⁷. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment. **Reason for emergency room visit** was based on the primary diagnostic code given for each visit. Categories of reasons included *injury/poisoning* (ICD-10-CA⁸ Chapter XIX Injury, poisoning and certain other consequences of external causes), *respiratory* (Chapter X Diseases of the respiratory system), *influencing factors* (Chapter XXI Factors influencing health status and contact with health services), *symptoms/signs* (Chapter XVIII Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified), and *other* (all other ICD-10-CA chapters).
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).

Emergency room visits by Albertan youth

Definitions and Notes (continued)

- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.

Emergency room visits by Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRCR). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Hospitalizations of Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report is an overview of 29,676 hospitalizations of 24,067 Albertan youth (12 to 24 years) in 2008/09. Type of service was determined from main service codes. Youth not registered with the Alberta Health Care Insurance Plan in 2008/09 were excluded.

The relationships between hospitalizations and age, gender, region of residence, socio-economic status, educational achievement and mental health status were considered. The cross-ministry service use of youth who were hospitalized was also studied.

- 3.1% of youth were hospitalized once and 0.6% had multiple hospitalizations. The most common services were pregnancy-related, surgery or procedures, and general medicine.
- Males and females had similar rates of hospitalization when pregnancy-related hospitalizations for females were excluded.
- Hospitalized youth tended to live in rural or mid-sized regions or in low socio-economic status areas, perform below educational expectations, or receive services for a mental health condition (youth with *schizophrenia/psychoses* were particularly likely to be hospitalized).
- Most hospitalizations for youth aged 17 and under were for a surgery or procedure or for general medicine. Hospitalizations for youth aged 18 and older or youth living in the lowest socio-economic status neighbourhoods were most often pregnancy-related. Youth performing below educational expectations were more likely to have pregnancy-related or psychiatric hospitalizations than youth doing better in school. Hospitalizations among youth with mental health conditions were more likely to be for *psychiatric* services and less likely for *surgery or general procedures* than hospitalizations among youth without mental health conditions.
- Hospitalization rates were highest for youth who received maltreatment-related intervention services, were charged with an offence, were involved in corrections, received Family Support for Children with Disabilities services, or received income support.
- Psychiatric hospitalizations were most common among hospitalizations for youth receiving intervention services or involved in justice or corrections.

Hospitalizations of Albertan youth

Context

Canadian hospitalization rates are affected by the unique geographic characteristics of Canada. There is regional variation in availability of primary health care providers, such as family physicians, and access to quality primary care services lowers hospitalization rates, particularly for conditions that can be managed on an outpatient basis.^{1,2} Hospitalization rates for chronic conditions are higher in rural as compared to urban areas.¹ Social factors also play a role in hospitalization rates; lower socio-economic status is associated with higher hospitalization rates, for example for mental illness and chronic health conditions.²

Canadian Institute for Health Information data show that injuries or poisoning, respiratory diseases, digestive system diseases, and mental disorders are common reasons for hospitalizations of both males and females.³

Hospitalizations due to injuries for youth under 20 years of age in 2005/06 in Canada were most likely among 15 to 19 year olds. The leading cause of injury hospitalizations for youth under 15 was unintentional falls, with motor vehicle collisions the leading cause for youth 15 to 19 years old.⁴

Childbirth is the most common reason for females of childbearing age to be hospitalized.⁵ While fewer than 5% of births in Canada are to females younger than 20 years old,⁶ females who give birth at a young age have a higher likelihood of experiencing negative outcomes as young mothers, including low socio-economic status, lower educational achievement, lower employment levels and lower likelihood of having a partner contributing to the household income.⁷

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Hospitalizations of Albertan youth

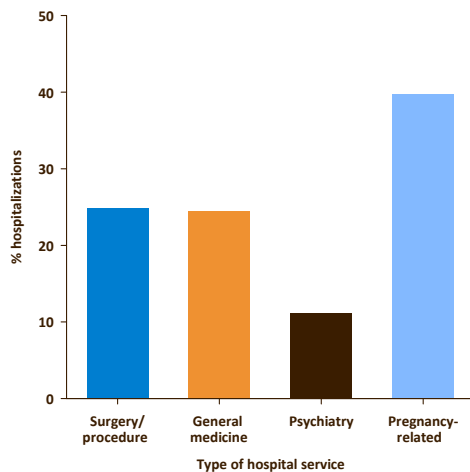

Number of hospitalizations (Tables 1 and 2)

This and the following analyses consider youth (aged 12 to 24 years, unless otherwise stated) who were registered with the Alberta Health Care Insurance Plan at any point in 2008/09.

- Among 655,758 who were registered, 4% had one or more hospitalizations.
- 3.1% of youth were hospitalized once and 0.6% had multiple hospitalizations.

Type of hospital service
Hospitalizations of Alberta youth
aged 12 to 24, 2008/09

Type of hospital service (Table 3)

- Analyses of type of hospital service are based on all hospitalizations. See the table below for examples of type of hospital service and *Definitions and Notes* (p. 19) for a description of coding.
- There were a total of 29,676 hospitalizations for 24,067 youth.
- 40% of hospitalizations were for pregnancy-related services.
- 25% of hospitalizations were for surgery or procedures, 25% were for general medicine, and 11% were for psychiatry services.

Type of hospital service, main service code examples

Category name	Examples
General medicine	Gastro-intestinal, respirology, allergy, etc.
Surgery/procedure	Orthopaedic surgery, urology, etc.
Psychiatry	Psychiatry or pediatric psychiatry
Pregnancy-related	Deliveries, antepartum obstetrics, or abortions

Hospitalizations of Albertan youth

Hospitalization rate by age and gender
Albertan youth aged 12 to 24

Hospitalization rate by age and gender (Table 4)

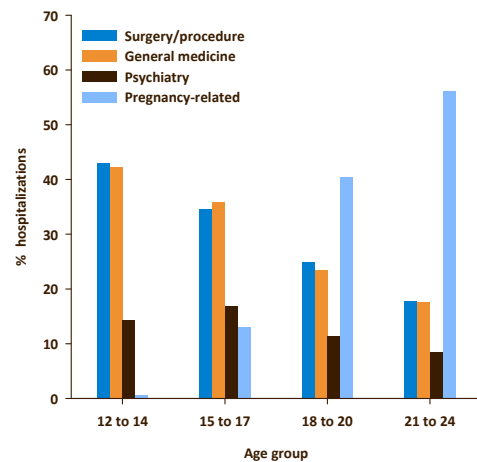

Pregnancy-related and non-pregnancy-related hospitalizations were analyzed separately for females in this and the following gender analyses.

- Female and male youth had similar rates of non-pregnancy-related hospitalizations, and little variation was observed across age.
- After age 18, females were substantially more likely to be hospitalized for pregnancy-related services, with the rate increasing with age.

Type of hospital service by age (Table 5)

- Most hospitalizations for youth aged 17 and under were for either a surgery or procedure or for general medicine.
- Hospitalizations for youth aged 18 and older were most often pregnancy-related. This reflects the fact that these youth are of reproductive age and the majority of births in Alberta occur in hospitals.

Type of hospital service by age
Hospitalizations of Albertan youth
aged 12 to 24, 2008/09

Type of hospital service by gender
Hospitalizations of Albertan youth
aged 12 to 24, 2008/09

Type of hospital service by gender (Table 6)

- Hospitalizations for female youth were most likely for pregnancy-related reasons (58% of hospitalizations).
- Once pregnancy-related hospitalizations were excluded, hospitalizations for females were most often for general medicine (45%) and hospitalizations for males were most often for surgery or procedure (46%).
- Psychiatry services comprised about 20% of hospitalizations for males and for females who did not receive pregnancy-related services.

Hospitalizations of Albertan youth

Hospitalization rate by region of residence and gender (Table 7)

- Male and female youth living in rural regions or mid-sized centres were more likely to be hospitalized than youth living in large centres (Edmonton or Calgary).
- There were slightly more females with pregnancy-related hospitalizations in rural regions (2.0%) than in mid-sized centres (1.8%) or large (1.4%) centres.

Hospitalization rate by region of residence and gender
Albertan youth aged 12 to 24

Type of hospital service by region of residence
Hospitalizations of Albertan youth aged 12 to 24, 2008/09

Type of hospital service by region of residence (Table 8)

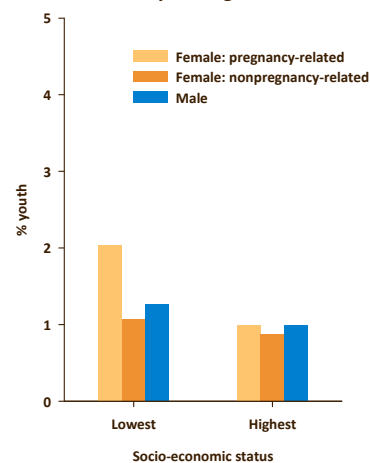

- The majority of hospitalizations in all regions of residence were for pregnancy-related services.
- Surgery or procedures made up a greater percentage of hospitalizations in large centres than in smaller centres, while general medicine hospitalizations were more common in rural and mid-sized centres than in large centres.
- Hospitalizations for psychiatric services were least common in rural regions.

Hospitalization rate by socio-economic status and gender (Table 9)

Socio-economic status captures the social and material environments in which youth live. Only the highest and lowest socio-economic status groups are shown in this and the following analysis. See *Definitions and Notes* (p. 18).

- Youth living in the lowest socio-economic status areas were more likely to be hospitalized than youth living in the highest socio-economic status areas.
- This effect was most pronounced for female youth with pregnancy-related hospitalizations (2.0% in the lowest socio-economic status areas compared to 1.0% in the highest socio-economic status areas).

Hospitalization rate by socio-economic status and gender
Albertan youth aged 12 to 24

Hospitalizations of Albertan youth

Type of hospital service by socio-economic status
Hospitalizations of Albertan youth aged 12 to 24, 2008/09

Type of hospital service by socio-economic status (Table 10)

- 43% of hospitalizations for youth in the lowest socio-economic status neighbourhoods were for pregnancy-related services.
- Among hospitalizations of youth living in the highest socio-economic status neighbourhoods, pregnancy-related (32%) and surgery or procedure services (31%) were equally common .

Hospitalization rate by educational achievement and gender (Table 11)

Youth (12 to 20 years) who were enrolled in the K-12 education system in 2008/09 are included in this and the following analysis. See *Definitions and Notes* (p.18).

- Youth who performed below educational expectations were more likely to be hospitalized than youth meeting or above educational expectations.
- The female pregnancy-related hospitalization rate was 10 times higher for youth performing below expectations (1.1%) compared to youth meeting or achieving above expectations (0.1%) but still represented only 1% of youth.

Hospitalization rate by educational achievement and gender
Albertan youth aged 12 to 20

Type of hospital service by educational achievement
Hospitalizations of Albertan youth aged 12 to 20, 2008/09

Type of hospital service by educational achievement (Table 12)

- Surgery or procedure was the most common type of hospital service for hospitalizations of youth meeting or above expectations (45% of hospitalizations) while general medicine hospitalizations were more common for youth performing below expectations (35%).
- Pregnancy-related and psychiatric hospitalizations were more common among hospitalizations of youth performing below expectations (19%, 22% respectively) than among hospitalizations of youth meeting or achieving above expectations (7%, 12% respectively).

Hospitalizations of Albertan youth

Hospitalization rate by mental health status and gender (Table 13)

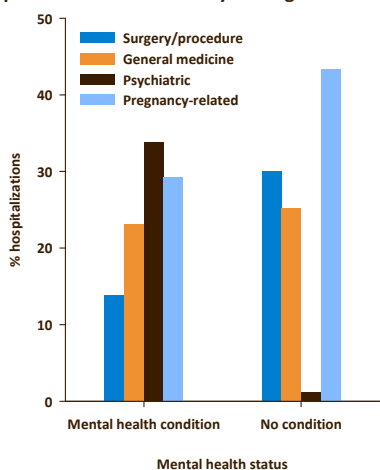

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 19).

- Youth with a mental health condition were more likely to be hospitalized than youth with no mental health condition, which may be partially due to how mental health was defined in this report (see *Definitions and Notes* p. 19).

Hospitalization rate by mental health status and gender
Albertan youth aged 12 to 24

Type of hospital service by mental health status
Hospitalizations of Albertan youth aged 12 to 24, 2008/09

Type of hospital service by mental health status (Table 14)

- Hospitalizations for youth with no mental health condition were most likely to be pregnancy-related (43% of hospitalizations).
- Psychiatric hospitalizations were much more common among hospitalizations for youth with a mental health condition (34%) than among hospitalizations of youth with no mental health condition (1%). This may be partially because the definition of mental health status included psychiatric hospitalizations. See *Definitions and Notes* p. 19.

Hospitalization rate by mental health condition and gender (Table 13)

- Male youth with *schizophrenia/ psychoses* disorders were far more likely to be hospitalized than youth with other mental health conditions.
- The hospitalization rate for pregnancy-related services was higher for females with a *mood/ anxiety* disorder than for females with other mental health conditions.

Hospitalization rate by mental health condition and gender
Albertan youth aged 12 to 24

Hospitalizations of Albertan youth

Type of hospital service by mental health condition
Hospitalizations of Albertan youth aged 12 to 24, 2008/09

Type of hospital service by mental health condition (Table 14)

- Hospitalizations for youth with *schizophrenia/psychoses* or *behavioural* conditions were most likely to be for psychiatry services.
- Hospitalizations for youth with *mood/anxiety* conditions were equally likely to be for psychiatry and pregnancy-related services.
- Hospitalizations for youth with *neurodevelopmental* conditions were most commonly for general medicine services.

Hospitalization rate by cross-service use and gender (Table 15)

Hospitalization rate by cross-service use and gender
Albertan youth aged 12 to 24

Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p. 19). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP.

- Low rates of hospitalizations were observed for youth registered with the AHCIP, enrolled in the K-12 education system or enrolled in a post-secondary institution.
- Higher hospitalization rates were observed for youth who received maltreatment-related intervention services, youth who received offence charges, youth with corrections involvement, and youth who received support from Family Support for Children with Disabilities (FSCD), among males and females with nonpregnancy-related hospitalizations.
- Youth receiving income support had elevated rates of hospitalizations, especially among females with pregnancy-related hospitalizations.

Hospitalizations of Albertan youth

Type of hospital service by cross-service use (Table 16)

- Hospitalizations for all youth registered with the AHCIIP were mostly for pregnancy-related services.
- Hospitalizations for youth enrolled in the K- 12 education system were equally likely to be for a surgery/procedure or for general medicine whereas surgery/procedure was the most common hospital service among hospitalizations for youth enrolled in a post-secondary institution.
- Psychiatric hospital services were more common in hospitalizations of youth who received maltreatment-related intervention services (41% of hospitalizations), youth with offence charges (37%), and youth with corrections involvement (40%), compared to hospitalizations of all youth registered with the Alberta Health Care Insurance Plan (11%).
- Hospitalizations of youth receiving services from FSCD were most likely to be for general medicine services (57%).
- Pregnancy-related services were most common among hospitalizations of youth receiving income support.

Hospitalizations of Albertan youth

Tables

Table 1. Number and percent of youth by age group and hospitalizations, Albertan youth aged 12 to 24 years, 2008/09

	Hospitalizations	Age group (years)					
		12 to 17	12 to 18	12 to 20	17 to 24	18 to 24	12 to 24
Number of youth	Females: pregnancy-related	550	1,085	3,151	10,014	9,675	10,225
	Females: nonpregnancy-related	2,713	3,265	4,324	4,286	3,717	6,430
	Males	2,913	3,540	4,793	5,110	4,499	7,412
	Any hospitalization	6,176	7,890	12,268	19,410	17,891	24,067
	No hospitalizations	278,955	326,987	425,244	400,349	352,736	631,691
	Total	285,131	334,877	437,512	419,759	370,627	655,758
Percent of youth	Females: pregnancy-related	0.2	0.3	0.7	2.4	2.6	1.6
	Females: nonpregnancy-related	1.0	1.0	1.0	1.0	1.0	1.0
	Males	1.0	1.1	1.1	1.2	1.2	1.1
	Any hospitalization	2.2	2.4	2.8	4.6	4.8	3.7
	No hospitalizations	97.8	97.6	97.2	95.4	95.2	96.3
	Total	100.0	100.0	100.0	100.0	100.0	100.0

*During the linkage process, gender values submitted for a given individual were sometimes discrepant. One gender had to be assigned to each individual. This very occasionally resulted in male gender being assigned to an individual who had pregnancy-related hospitalizations. The few cases to which this applied were included in the male hospitalizations in the analyses in this report.

Table 2. Number and percent of youth by number of hospitalizations, Albertan youth aged 12 to 24 years, 2008/09

	Number of hospitalizations	
Number of youth	Single	20,353
	Multiple	3,714
	Any hospitalization	24,067
	No hospitalizations	631,691

	Psychiatry	1,665	1,665	1,633	3,298
	Pregnancy-related*	11,719	0	–	11,765
	Total hospitalizations	20,346	8,627	9,330	29,676
Percent of hospitalizations	Surgery/procedure	15.0	35.5	46.0	24.8
	General medicine	19.2	45.2	36.0	24.5
	Psychiatry	8.2	19.3	17.5	11.1
	Pregnancy-related*	57.6	0.0	–	39.6
	Total hospitalizations	100.0	100.0	100.0	100.0

*During the linkage process, gender values submitted for a given individual were sometimes discrepant. One gender had to be assigned to each individual. This very occasionally resulted in male gender being assigned to an individual who had pregnancy-related hospitalizations. The few cases to which this applied were included in the male hospitalizations in the analyses in this report, but they are not reported as “pregnancy-related males” in this table.

Hospitalizations of Albertan youth

Hospitalizations of Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁸. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Hospitalizations of Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan or the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2⁹). Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment. **Hospital service type** was defined by the main patient service code (the patient service that contributes to the longest portion of a patient's stay; see the Canadian Institute for Health Information’s DAD Abstracting Manual¹⁰ for codes). Categories of services were labeled *general medicine* (patient service codes 01 to 29, 55, 56, 58, 60 to 63, 66 to 76, 82, 91, 96, 99), *surgery/procedure* (patient service codes 30 to 49, 81, 87), *psychiatry* (patient service codes 64, 65), or *pregnancy-related* (patient service codes 51 to 54, 59).
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth involved in apprenticeship programs were not included.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.

Hospitalizations of Albertan youth

Definitions and Notes (continued)

- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.

Hospitalizations of Albertan youth

Hospitalizations of Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFCR). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Offence charges among Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report is an overview of 6,311 Albertan youth (12 to 17 years) charged with offences in 2008/09. Youth with offence charges include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). Number of offences in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.

The relationships between number of charges and age, gender, region of residence, socio-economic status, educational achievement and mental health status were considered. Youth charged with offences in the study year were compared to youth of the same ages not charged with offences in the study year. The cross-ministry service use of youth with offence charges was also studied.

- 2.1% of youth were charged with an offence in the study year. Of these, 44% had one charge in the year, 29% had two or three charges, and 27% had four or more charges.
- Offence charges were most common among youth aged 16 to 17.
- Males were more than twice as likely as females to be charged with offences, particularly multiple offences.
- Youth charged with offences were more likely than youth not charged with offences to live in lower socio-economic status neighbourhoods, to perform below educational expectations, to receive services for a mental health condition, or to visit an emergency room or be hospitalized.
- Youth with offence charges, particularly those with four or more charges, were more likely to receive maltreatment-related intervention services than youth without offence charges.

Offence charges among Albertan youth

Context

Youth who are charged with offences constitute a small proportion of the total youth population. According to Statistics Canada, the number of charges per 100 youth in Canada in 2010 ranged from 2.2 (for 12 year olds) to 14.3 (for 17 year olds), with some youth committing multiple offences.¹ Property offences, such as theft or break and enter, are the most common offences for which youth are charged.²

Societal concern over young offenders is high. A solid knowledge of risk and protective factors for these youth is critical in reducing the number of young offenders and in reducing the number of young offenders who become repeat offenders in the youth or adult criminal justice systems.

Previous research has identified a number of risk factors for offending. Young offenders are more often male than female, and are more often older youth than younger youth.² Aggressive childhood behaviour, disruptive family life, family adversity, poor school performance, poor peer relations, substance use, and low socio-economic status are risk factors that increase the likelihood of youth committing an offence.^{3,4} The more risk factors youth experience, the more likely they are to become repeat offenders.³

Protective factors, associated with reduced risk of being charged with an offence, include positive social attitudes, supportive relationships with adults, appropriate discipline and limit-setting from parents, positive social skills, and problem solving skills.⁵

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth

Educational experiences of Albertan youth

Mental health status of Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Maltreatment-related investigations among Albertan youth

Maltreatment-related intervention services received by Albertan youth

Physician visits by Albertan youth

Emergency room visits by Albertan youth

Hospitalizations of Albertan youth

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Offence charges among Albertan youth

Number of charges (Table 1)

This and the following analyses consider all Albertan youth (12 to 17 years) in 2008/09. See *Definitions and Notes* (p. 13).

- 6,311 youth (2.1%) were charged with an offence.
- 2,747 youth who were charged with an offence received one charge (44%), 1,843 received two or three charges (29%) and 1,721 received four or more charges (27%).
- 301,392 youth (97.9%) of the same age group had no charges (graph not shown).

Number of charges
Albertan youth aged 12 to 17

Number of charges by age
Albertan youth aged 12 to 17

Number of charges by age (Tables 2 and 3)

- Older youth were more likely to be charged with an offence than younger youth.
- 0.4% of youth aged 12 to 13 were charged with an offence compared to 2.0% of youth aged 14 to 15 and 3.5% of youth aged 16 to 17 (graph not shown).
- Among youth with one or more charges, the most common age group was 16 to 17 years old, with the percentage of youth in this group increasing slightly with increasing number of charges.

Number of charges by gender (Tables 4 and 5)

- Males were more likely than females to be charged with an offence.
- 3% of males and 1% of females were charged with at least one offence (graph not shown).
- Males were more likely to have multiple charges than females. 79% of youth with four or more charges were male.

Number of charges by gender
Albertan youth aged 12 to 17

Offence charges among Albertan youth

Number of charges by region of residence
Albertan youth aged 12 to 17

Number of charges by region of residence
(Table 6)

- The percentage of youth charged with multiple offences differed slightly by region of residence.
- Youth with two or three charges were slightly more likely to live in rural regions than youth with more or less charges.

Number of charges by socio-economic status (Table 7)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p. 12).

- 23% of youth with no charges lived in the lowest socio-economic status areas compared to 32% of youth with one charge, 37% with two or three charges, and 41% with four or more charges.
- Youth who were charged with an offence were less likely to live in the highest socio-economic status neighbourhoods than youth who were not charged.

Number of charges by socio-economic status (SES)
Albertan youth aged 12 to 17

Number of charges by educational achievement
Albertan youth aged 12 to 17

Number of charges by educational achievement (Table 8)

This analysis considers youth (aged 12 to 20 years) who were enrolled in the K-12 education system in Alberta in 2008/09. See *Definitions and Notes* (p. 12).

- A higher number of charges was associated with poorer school performance.
- 83% of youth with no charges were meeting or above educational expectations, compared to 48% of youth with one charge, 35% with two or three charges, and 18% of youth with four or more charges.

Offence charges among Albertan youth

Number of charges by mental health status (Table 9)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 13).

- Youth with one or more charges were more likely to have a mental health condition than youth with no charges. This may be partially due to increased access to mental health services for youth charged with an offence.

Number of charges by mental health status
Albertan youth aged 12 to 17

Number of charges by mental health condition
Albertan youth aged 12 to 17

Number of charges by mental health conditions (Table 9)

- Mood/anxiety* conditions were the most common mental health condition in all groups and were markedly more common among charged youth.
- Youth with four or more charges were more likely to have *behavioural* conditions (18%) than youth with two or three charges (14%), youth with one charge (13%) and youth with no charges (3%).
- Rates of *schizophrenia/psychoses* also increased with number of charges.
- Rates of neurodevelopmental conditions varied little across number of charges.

Number of charges by health service use (Table 10)

- The rate of high numbers of physician visits (five or more) varied little with number of charges.
- Emergency room use did vary across number of charges. 47% of youth with four or more charges visited an emergency room, compared to 39% of youth with two or three charges, 33% of youth with one charge, and 22% of youth with no charges.
- Youth with more charges were also more likely to be hospitalized than youth with fewer or no charges.

Number of charges by health service use
Albertan youth aged 12 to 17

Offence charges among Albertan youth

Number of charges by cross-service involvement (Table 11)

Youth were considered in this analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p. 13). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP. 17% of youth with offence charges were not registered with AHCIP.

- Receipt of services from Family Support for Children with Disabilities varied little by number of charges.
- 2% of youth with no charges received maltreatment-related intervention services, compared to 13% with one charge, 19% with two or three charges, and 29% of youth with four or more charges.
- Corrections involvement increased with number of charges. 78% of youth with four or more charges had some involvement with corrections.

Offence charges among Albertan youth

Tables

Table 1. Number and percent of youth by number of charges, Albertan youth aged 12 to 17 years, 2008/09

Number of youth	Number of charges	
	Number of charges	Count
	No charges	301,392
	One charge	2,747
	Two or three charges	1,843
	Four or more charges	1,721

*Only youth registered in the Alberta Health Care Insurance Plan were included in this analysis

**Family Support for Children with Disabilities

Offence charges among Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁶. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Offence charges among Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan or the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁷. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the "**health registry**" refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).

Offence charges among Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Corrections involvement among Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report is an overview of 5,178 Albertan youth (2% of youth aged 12 to 17 years) who were involved in corrections in 2008/09. Youth with corrections involvement have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (in which the sentence is served in the community) or custody (in which the sentence is served in a young offender facility).

Type of corrections involvement and Aboriginal status of youth involved in corrections were considered, along with age, gender, region of residence, socio-economic status, educational achievement, and health service use. Youth involved in corrections were compared to youth not involved in corrections. The cross-ministry service use of youth involved in corrections was also studied.

- 1.7% of Albertan youth were involved in corrections in 2008/09; 18% of these were in custody at some point in the year.
- Youth involved in corrections were primarily older teenagers who were male. One in four youth involved in corrections was Aboriginal.
- Compared to youth not involved in corrections, youth involved in corrections were more likely to live in the lowest socio-economic status neighbourhoods, to perform below educational expectations, to receive services for a mental health condition, to visit an emergency room, to be hospitalized, or to receive maltreatment-related intervention services. All of these effects were larger for youth in custody than for youth with community sentences or pre-trial supervision.
- Aboriginal youth involved in corrections were more likely than non-Aboriginal youth involved in corrections to live in rural regions or the lowest socio-economic status neighbourhoods, to visit emergency rooms, to be hospitalized, or to receive maltreatment-related intervention services. They were less likely to meet or exceed educational expectations.

Corrections involvement among Albertan youth

Context

A small minority of youth in Alberta becomes involved in corrections. Understanding the factors associated with corrections involvement, or the lack thereof, can inform policies and programs whose aim is to reduce the risk that youth will find themselves in the corrections system.

Known risk factors for youth involvement in the corrections system by Canadian youth are male gender, older age (corrections involvement is more common for older youth than younger), low socio-economic status, poor school engagement, and presence of a mental health condition, notably depression, anxiety or substance abuse disorder.^{1,2}

Aboriginal ethnicity is also associated with risk for corrections involvement. Aboriginal youth made up 6% of the population of 12 to 17 year olds in Alberta in 2006.⁴ However, as shown in this report and others, the proportion of Aboriginal youth in corrections is much greater than 6%.⁴ This over-representation may be at least partially due to risks associated with lower socio-economic status (there are lower levels of parental education, higher unemployment rates, and a greater proportion of lone parent families among the Aboriginal population than the non-Aboriginal population).^{3,4}

Protective factors, associated with youth who are not involved in corrections, include high socio-economic status, remaining in school, absence of substance use issues, and achieving good academic standing.^{1,2}

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Corrections involvement among Albertan youth

Type of corrections involvement (Table 1)

This and the following analyses consider youth (aged 12 to 17 years) living in Alberta in 2008/09. See *Definitions and Notes* (p. 20).

- 5,178 (1.7%) of Albertan youth were involved with corrections in 2008/09.

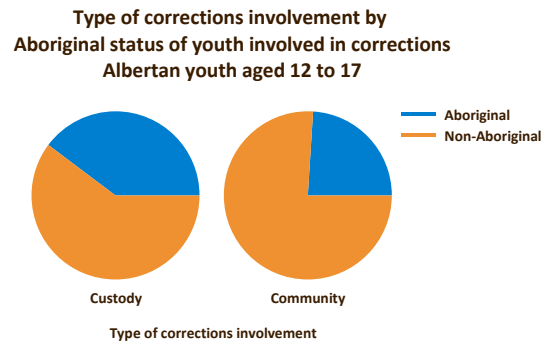

Type of corrections involvement (Table 1)

- 5,060 (98%) youth involved in corrections received a community sentence or pre-trial supervision and 941 (18%) youth involved in corrections were in custody for part of 2008/09.
- Most youth who were in custody also had a community sentence or pre-trial supervision in 2008/09 (823 youth). All custodial sentences are comprised of two parts: a custodial portion and a community portion. Therefore most of the youth in custody should be in 'custody and community' as well.

Type of corrections involvement by Aboriginal status (Table 2)

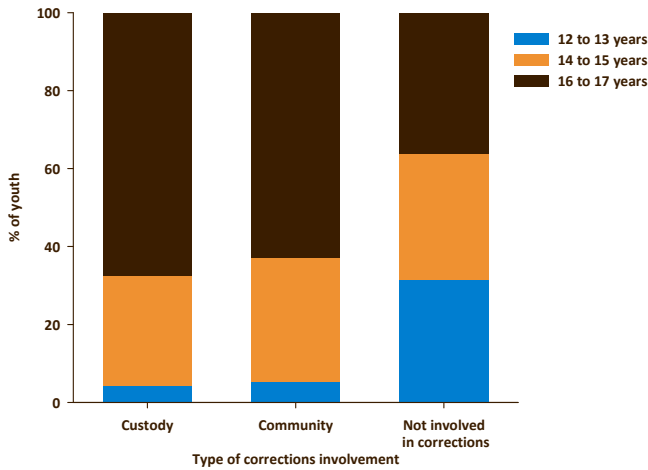

The Aboriginal status of youth not involved in corrections was unavailable for this project.

- Among all youth in corrections in 2008/09, 24% were Aboriginal (not shown in graph).
- 40% of youth in custody were Aboriginal while 24% of youth who received a community sentence or pre-trial supervision were Aboriginal.

Corrections involvement among Albertan youth

Type of corrections involvement by age
Albertan youth aged 12 to 17

Type of corrections involvement by age
(Table 3)

- 68% of youth in custody were 16 to 17 years old, compared to 63% of youth with a community sentence or pre-trial supervision who were in this age group.
- For youth not involved in corrections, the proportions of youth in each age group (12 to 13, 14 to 15, and 16 to 17) were similar.

Aboriginal status by age (Table 4)

- Aboriginal youth involved in corrections were slightly younger than non-Aboriginal youth involved in corrections.
- The majority of youth involved in corrections were 16 to 17 years old (60% of Aboriginal and 64% of non-Aboriginal youth).

Aboriginal status of youth involved in corrections by age
Albertan youth aged 12 to 17

Type of corrections involvement by gender (Table 5)

Type of corrections involvement by gender
Albertan youth aged 12 to 17

- Youth involved in corrections were predominantly male (69% of youth).
- 80% of youth in custody and 69% of youth with a community sentence or pre-trial supervision were male.

Corrections involvement among Albertan youth

Aboriginal status by gender (Table 6)

- 66% of Aboriginal youth involved in corrections were male while 70% of non-Aboriginal youth involved in corrections were male.

Aboriginal status of youth involved in corrections by gender
Albertan youth aged 12 to 17

Type of corrections involvement by region of residence
Albertan youth aged 12 to 17

Type of corrections involvement by region of residence (Table 7)

- Among youth in custody, 68% lived in large centres (Edmonton or Calgary) compared to 63% of youth with a community sentence or pre-trial supervision and 62% of youth not involved in corrections.
- About 20% of youth in all groups lived in rural areas.

Aboriginal status by region of residence (Table 8)

- 50% of Aboriginal youth involved in corrections lived in large centres (Edmonton or Calgary) whereas 66% of non-Aboriginal youth involved in corrections lived in large centres.
- Twice as many Aboriginal youth (35%) than non-Aboriginal youth (17%) involved in corrections lived in rural regions.

Aboriginal status of youth involved in corrections
by region of residence
Albertan youth aged 12 to 17

Corrections involvement among Albertan youth

Type of corrections involvement by socio-economic status (SES)
Albertan youth aged 12 to 17

Type of corrections involvement by socio-economic status (Table 9)

Socio-economic status captures the social and material environments in which youth live. Only the highest and lowest socio-economic status groups are shown in this and the following analysis. See *Definitions and Notes* (p. 20).

- Almost half of youth in custody lived in the lowest socio-economic status neighbourhoods (44%) compared to 36% of youth with a community sentence or pre-trial supervision and 23% of youth not involved in corrections.

Aboriginal status by socio-economic status (Table 10)

- 48% of Aboriginal youth involved in corrections lived in the lowest socio-economic status neighbourhoods, compared to 32% of non-Aboriginal youth involved in corrections.
- 7% of Aboriginal youth involved in corrections lived in the highest socio-economic status neighbourhoods, compared to 14% of non-Aboriginal youth involved in corrections.

Aboriginal status of youth involved in corrections by socio-economic status (SES)
Albertan youth aged 12 to 17

Type of corrections involvement by educational achievement
Albertan youth aged 12 to 17

Type of corrections involvement by educational achievement (Table 11)

This and the following analysis are limited to youth who were enrolled in the K-12 education system in Alberta in 2008/09. See *Definitions and Notes* (p. 20).

- 39% of youth with a community sentence or pre-trial supervision were meeting or achieving above educational expectations, compared to 13% of youth in custody and 83% of youth not involved in corrections.

Corrections involvement among Albertan youth

Aboriginal status by educational achievement (Table 12)

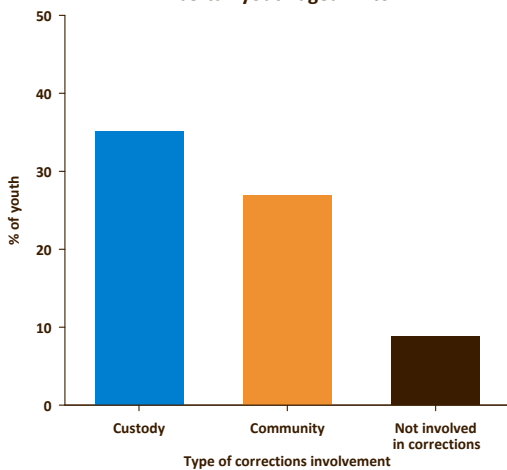

Aboriginal status was determined by Justice and Solicitor General records only. Comparisons between Aboriginal and non-Aboriginal students should be interpreted with caution, because no data were available for students who attended schools on First Nations reserves.

- 17% of Aboriginal youth involved in corrections were meeting or achieving above educational expectations compared to 43% of non-Aboriginal youth involved in corrections.

Aboriginal status of youth involved in corrections by educational achievement
Albertan youth aged 12 to 17

Type of corrections involvement by presence of a mental health condition
Albertan youth aged 12 to 17

Type of corrections involvement by mental health status (Table 13)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 21).

- Mental health conditions were more common among youth in custody (35%) and youth with a community sentence or pre-trial supervision (27%) than those not involved in corrections (9%). This may be partially due to enhanced access to mental health services by youth involved in corrections.

Aboriginal status by mental health status (Table 14)

- 30% of Aboriginal youth involved in corrections had a mental health condition, compared to 26% of non-Aboriginal youth involved in corrections.

Aboriginal status of youth involved in corrections by presence of a mental health condition
Albertan youth aged 12 to 17

Corrections involvement among Albertan youth

Type of corrections involvement by mental health condition
Albertan youth aged 12 to 17

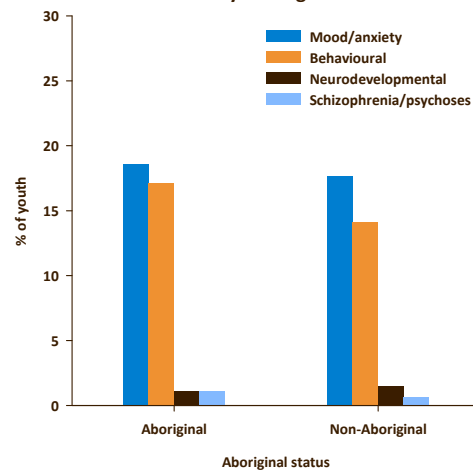

Type of corrections involvement by mental health condition (Table 13)

- *Behavioural* conditions (23%) and *mood/anxiety* conditions (22%) were equally likely among youth in custody.
- *Mood/anxiety* conditions (18%) were slightly more common than *behavioural* conditions (15%) among youth with a community sentence or pre-trial supervision.
- Note that *neurodevelopmental* conditions, including fetal alcohol spectrum disorder, were under-represented because data from community mental health clinics were not available for this project.

Aboriginal status by mental health condition (Table 14)

- The rates of mental health conditions were similar for Aboriginal and non-Aboriginal youth involved in corrections.
- *Behavioural* conditions were slightly more common in Aboriginal (17%) than non-Aboriginal (14%) youth.
- *Schizophrenia/psychoses* conditions were also more common in Aboriginal (1.1%) than non-Aboriginal (0.6%) youth involved in corrections.

Aboriginal status of youth involved in corrections by mental health condition
Albertan youth aged 12 to 17

Type of corrections involvement by health service use
Albertan youth aged 12 to 17

Type of corrections involvement by use of health services (Table 15)

- Youth in custody were most likely to visit an emergency room (50%) in comparison to youth receiving a community sentence or pre-trial supervision (38%) and youth not involved in corrections (22%).
- Hospitalizations were substantially more likely among youth in custody (13%) and with a community sentence or pre-trial supervision (6%) than among youth not involved in corrections (2%).

Corrections involvement among Albertan youth

Aboriginal status by use of health services (Table 16)

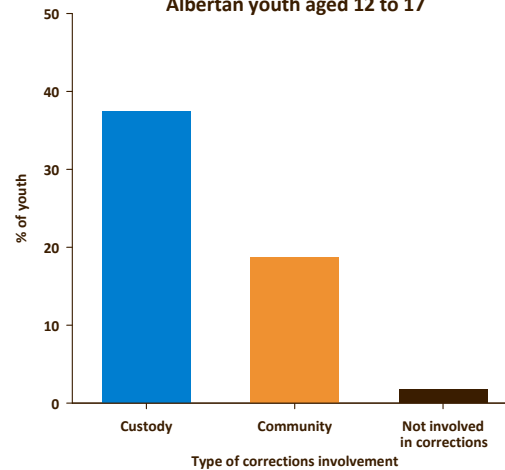

- Non-Aboriginal youth (25%) involved in corrections were more likely to have five or more physician visits than Aboriginal youth (20%) involved in corrections.
- Emergency room visits and hospitalizations were higher among Aboriginal (50%, 8%) than non-Aboriginal (35%, 5%) youth involved in corrections.

Aboriginal status of youth involved in corrections by health service use
Albertan youth aged 12 to 17

Type of corrections involvement by maltreatment-related intervention services (Table 17)

Type of corrections involvement by percentage with maltreatment-related intervention services
Albertan youth aged 12 to 17

Youth were considered in this and the following analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; see *Definitions and Notes*, p. 21). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP. 14% of youth with corrections involvement were not registered with AHCIP.

- Youth involved in corrections were more likely to have received maltreatment-related intervention services than youth not involved in corrections.
- 37% of youth in custody also received maltreatment-related intervention services compared to 19% of youth with a community sentence or pre-trial supervision and 2% of youth with no corrections involvement.

Corrections involvement among Albertan youth

Aboriginal status of youth involved in corrections
by percentage with maltreatment-related intervention services
Albertan youth aged 12 to 17

Aboriginal status by maltreatment-related intervention services (Table 18)

- Aboriginal youth involved in corrections were more likely to receive maltreatment-related intervention services than non-Aboriginal youth involved in corrections.
- 31% of Aboriginal youth involved in corrections, compared to 15% of non-Aboriginal youth involved in corrections, received maltreatment-related intervention services.

Corrections involvement among Albertan youth

Definitions and notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Corrections involvement among Albertan youth

Definitions and notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁶. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility). Youth self-identified as Aboriginal or non-Aboriginal.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the “**health registry**” refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.).

Corrections involvement among Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Post-secondary students in Alberta

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report profiles 113,154 youth (aged 17 to 24 years) who were enrolled in Alberta's post-secondary institutions in 2008/09.

Credential types for post-secondary programs include bachelor/applied/graduate programs (also called degree-granting), certificate/diploma programs, and programs with no credential received upon completion. *Enrolment status* refers to full-time or part-time enrolment. Youth enrolled in apprenticeship programs were not available in this study.

Age, gender, region of residence, socio-economic status, mental health status, health service use, credential type, enrolment status, receipt of maltreatment-related intervention services, and receipt of income support are detailed. Comparisons are made with youth of the same ages who were not post-secondary students.

- 24% of all youth 17 to 24 years old were attending post-secondary institutions, with the highest rate (35%) for 20 year olds.
- More females than males were pursuing a post-secondary education. Females were also more likely than males to be enrolled in degree-granting programs.
- Post-secondary students, especially those enrolled in degree-granting or full-time programs, were more likely to be living in the highest socio-economic status neighborhoods than youth not enrolled in post-secondary institutions. Youth not enrolled in post-secondary studies were more likely to have visited an emergency room or to have been hospitalized at least once during the year, and were more likely to have five or more physician visits during the year.
- Post-secondary students enrolled part-time or in *no credential* programs were more likely than those enrolled full-time or in credential programs to have a mental health condition or to have been hospitalized at least once during the year.
- Youth receiving maltreatment-related intervention services or income support were over-represented in *no credential* programs and part-time programs compared to other post-secondary students.

Post-secondary students in Alberta

Context

The benefits of a post-secondary education have been well documented at both individual and societal levels. In addition to securing a higher income on average, individuals with an advanced education can look forward to greater employment opportunities¹. Almost two-thirds of jobs opening in Canada over the next ten years will require a post-secondary education¹. In addition, people with a post-secondary education are more likely to experience greater levels of job satisfaction and long-term employment, and benefit from positive health and well-being outcomes.¹

According to Human Resources and Skill Development Canada, between 2003/04 and 2005/06, 23% of Canadian youth and 17% of Albertan youth aged 18 to 24 years old were enrolled in university, with a further 15% of Canadian youth and 14% of Albertan youth enrolled in colleges or trades programs. Enrolment rates were higher for females than for males, and for youth in large urban centres compared with rural areas.²

Contact with health services for mental health issues appears to be on the rise among Canada's post-secondary students.³ Adequacy of income is also an issue; post-secondary students comprised 4.8% of those visiting food banks in Alberta between 2001 and 2011.⁴

The service use patterns of post-secondary students in other areas are less well documented. This report provides new data on service use for post-secondary students, including health services, intervention services, and income support.

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth

Educational experiences of Albertan youth

Mental health status of Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Post-secondary students in Alberta

Post-secondary status by age (Table 1)

This analysis considers youth (aged 17 to 24 years) who were registered in post-secondary institutions in Alberta in 2008/09.

- Students between 19 and 22 years were the most likely to be enrolled in post-secondary studies, with more than 30% of students in this age group enrolled in a post-secondary program.
- Enrolment climbed from 1% for 17 year olds to 20% for 18 year olds, peaked at 35% for 20 year olds, and declined to 20% by age 24.

Post-secondary status by gender
Albertan youth aged 17 to 24

Post-secondary status by gender (Table 2)

This analysis and the following four analyses include youth (aged 17 to 24 years) enrolled in post-secondary studies in 2008/09, compared with youth not enrolled.

- A greater proportion of females (57%) compared to males (43%) were enrolled in post-secondary institutions.

Post-secondary status by region of residence (Table 3)

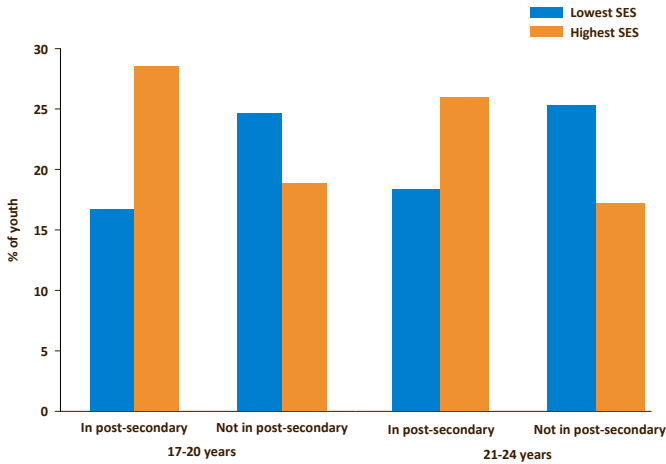

- Post-secondary students were more likely to live in large urban centres (Edmonton and Calgary) than youth not enrolled in post-secondary studies.
- Conversely, youth not pursuing post-secondary studies were more likely to be living in mid-sized centres or rural regions across Alberta.
- These findings may be partially due to the concentration of post-secondary institutions in larger centres.

Post-secondary status by region of residence
Albertan youth aged 17 to 24

Post-secondary students in Alberta

Post-secondary status by socio-economic status (SES) and age
Albertan youth aged 17 to 24

Post-secondary status by socio-economic status and age (Table 4)

Socio-economic status (SES) captures the social and material environments in which youth lived. In this report, “lowest socio-economic status” refers to the lowest socio-economic status group, while “highest” refers to the highest group. See *Definitions and Notes* (p. 19).

- Youth enrolled in post-secondary institutions were more likely to live in the highest socio-economic status neighbourhoods and less likely to live in the lowest than youth not enrolled in post-secondary institutions.
- This effect was more pronounced for the 17 to 20 year olds than the 21 to 24 year olds. A greater proportion of younger students may have lived with their parents.

Post-secondary status by mental health condition (Table 5)

Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p. 20).

- The vast majority of youth (almost 90%) between 17 and 24 years old did not have a mental health condition during 2008/09.
- Whether they were enrolled in post-secondary studies or not, the percent of youth with a mental health condition during 2008/09 was between 11 and 12%.

Post-secondary status by mental health condition
Albertan youth aged 17 to 24

Post-secondary status by health service use
Albertan youth aged 17 to 24

Post-secondary status by health service use (Table 6)

This analysis considers youth (aged 17 to 24 years) registered in the Alberta Health Care Insurance Plan in 2008/09.

- A lower percentage of health services use was evident among post-secondary students than non-students.
- Post-secondary students were less likely to visit physicians, visit emergency rooms, or be hospitalized, than those not attending post-secondary institutions.
- Among post-secondary youth, 38% had not used any health service during the year, compared to 26% of youth not enrolled in a post-secondary institution.

Post-secondary students in Alberta

Credential type by age (Table 7)

This analysis and the following five analyses consider the credential type pursued by youth (aged 17 to 24 years) in Alberta post-secondary institutions in 2008/09.

- 50 to 57% of youth 18 to 24 years old were enrolled in *bachelor/applied/graduate level* programs.
- 49% of 17 year old youth were in *no credential* programs, perhaps due to attending high school upgrading programs or enrolling in post-secondary programs during the summer after high school.
- The percentage of youth 18 and older enrolled in *no credential* programs, such as Open Studies, increased with age.

Credential type by age
Albertan youth aged 17 to 24

Credential type by gender (Table 8)

Credential type by gender
Albertan youth aged 17 to 24

- Females made up a higher percentage of post-secondary students than males, across all credential types.
- The gender difference was greatest in non-credential programs, in which 59% of students were females, compared with 57% in degree-granting (*bachelor/applied/graduate level*) programs and 54% in *certificate/diploma* programs.

Credential type by region of residence (Table 9)

- A greater percentage of students living in large centres (Edmonton and Calgary) were enrolled in *bachelor/applied/graduate level* programs than in other regions. This pattern reflects the concentration of degree-granting institutions in these centres.
- 34% of students in rural regions were enrolled in *certificate/diploma* programs, compared with 31% and 23% in mid-sized and large centres, respectively.
- *No credential* programs captured 19%, 21%, and 17% of students in rural, mid-sized, and large centres, respectively.

Credential type by region of residence
Albertan youth aged 17 to 24

Post-secondary students in Alberta

Credential type by socio-economic status (SES)
Albertan youth aged 17 to 24

Credential type by socio-economic status
(Table 10)

- Students in degree-granting programs lived in higher socio-economic status neighbourhoods on average than other post-secondary students.
- 52% of students in degree-granting programs were living in the high middle or highest socio-economic status neighbourhoods, compared with 39% in each of *certificate/diploma* and *no credential* programs.
- 28% of students in degree-granting programs and 39% in each of *certificate/diploma* and *no credential* programs were living in the low middle or lowest socio-economic status neighbourhoods.

Credential type by mental health condition
(Table 11)

Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.20).

- Students enrolled in *no credential* programs were more likely than students pursuing credentials to have a mental health condition.
- 16% of students in a *no credential* program had a mental health condition.

Credential type by mental health condition
Albertan youth aged 17 to 24

Credential status by health service use
Albertan youth aged 17 to 24

Credential type by health service use
(Table 12)

- Among youth not pursuing a credential, 48% had not used a health service during the year, compared to 38% of youth enrolled in *certificate/diploma* programs, and 34% of youth enrolled in *bachelor/applied/graduate level* programs.
- Hospitalizations were more common among youth enrolled in *no credential* programs than the other types of programs.
- Among youth enrolled in *bachelor/applied/graduate* programs, 41% visited a physician between one and four times, compared to 28% of youth not enrolled in a credentialed program.

Post-secondary students in Alberta

Enrolment status by age (Table 13)

This analysis and the following five analyses consider the full- and part-time enrolment status of youth (aged 17 to 24 years) who were pursuing a post-secondary education in Alberta in 2008/09.

- For students aged 18 to 24 years, the percentage of students who were enrolled in full-time programs decreased with increasing age.
- 17 year old youth were much more likely to be enrolled in part-time programs than older youth. This may be because they attended high school upgrading programs or enrolled in post-secondary programs during the summer after high school.

Enrolment status by age
Albertan youth aged 17 to 24

Enrolment status by gender (Table 14)

Enrolment status by gender
Albertan youth aged 17 to 24

- Males and females had similar proportions of full- and part-time post-secondary enrolment status.

Enrolment status by region of residence (Table 15)

- Full- and part-time enrolment status did not vary substantially by region of residence.
- Rural, mid-sized, and large centres had similar proportions of part-time post-secondary students (17%, 18% and 16%, respectively).

Enrolment status by region of residence
Albertan youth aged 17 to 24

Post-secondary students in Alberta

Enrolment status by socio-economic status (SES)
Albertan youth aged 17 to 24

Enrolment status by socio-economic status
(Table 16)

- In general, full-time students had higher socio-economic status than part-time students.
- Among full-time students, 47% were living in the high middle or highest socio-economic status neighbourhoods, compared to 41% of part-time students.
- Among part-time students, 36% were living in the low middle or lowest socio-economic status neighbourhoods, compared to 32% of full-time students.

Enrolment status by mental health condition (Table 17)

Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.20).

- Among full-time post-secondary students, 11% had a mental health condition in 2008/09, compared to 15% of part-time post-secondary students in the same period.

Enrolment status by mental health condition
Albertan youth aged 17 to 24

Enrolment status by health service use
Albertan youth aged 17 to 24

Enrolment status by health service use
(Table 18)

- Among part-time post-secondary students, 48% had not used a health service during the year, compared to 36% of full-time students.
- Emergency room visits and hospitalizations were more common among part-time than full-time students. In contrast, physician visits were more common among full-time students.

Post-secondary students in Alberta

Credential type of youth receiving maltreatment-related intervention services (Table 19)

This analysis and the one below include youth (aged 17 to 22 years) enrolled in post-secondary institutions in 2008/09 and receiving maltreatment intervention services. Students who were aged 23 and 24 years were excluded because intervention services are only provided up to age 22. Note that 6% of youth receiving intervention services were attending post-secondary institutions (133 youth).

- Over half (53%) of post-secondary students receiving intervention services were enrolled in *no credential* programs. In contrast, over half (55%) of students not receiving such services were enrolled in degree-granting programs.
- 38% of students receiving intervention services were pursuing a certificate or diploma, compared with 26% of those not receiving intervention services.

Enrolment status of youth receiving maltreatment-related intervention services (Table 20)

- 77% of students aged 17 to 22 years old who were receiving maltreatment-related intervention services and were enrolled in post-secondary programs were full-time students.
- 85% of students not receiving intervention services were attending post-secondary institutions full-time.

Post-secondary students in Alberta

Credential type of youth with any income support activity by client type (Table 21)

This analysis and the one below include youth (aged 18 to 24 years) enrolled in post-secondary institutions with any income support activity during 2008/09. Youth with any income support activity are classified as *expected to work* or *barriers to full employment* in Human Services' income support system. For context, note that 6% of youth with any income support activity were attending post-secondary institutions, compared with 28% of post-secondary youth in the same age group with no income support activity.

- Among youth with any income support activity, youth experiencing *barriers to full employment* were more likely to be enrolled in degree-granting programs (21% of students) than youth *expected to work* (10%). Conversely, youth experiencing *barriers to full employment* were less likely to be enrolled in *no credential* programs (55% of students) than youth *expected to work* (67%).

Enrolment status of youth with any income support activity and client type
Albertan youth aged 18 to 24

Enrolment status of youth with any income support activity by client type (Table 22)

- Part-time status was more prevalent among post-secondary students with any income support activity than among students with no income support activity.
- Among students with any income support activity and *experiencing barriers to full employment*, 35% were enrolled in part-time programs, compared to 30% of students *expected to work* and 19% of students with no income support activity.

Post-secondary students in Alberta

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- The study population inclusion criteria for the Enterprise and Advanced Technology population include “active learner” youth up to 25 years (as of March 31, 2009) who were enrolled in or completed a credit program in publicly funded post-secondary credit program institutions in Alberta (excluding Taylor University College and Seminary) in the 2008/09 academic year. An academic year constitutes the full year (i.e., all sessions offered by an institution during a year). The study population excludes students who completed an apprenticeship program or enrolled in a university transfer program.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.

Definitions and Notes

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with Health for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁶. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- **Credential types** for post-secondary programs include bachelor/applied/graduate programs (also called degree-granting), certificate/diploma programs, and programs with no credential received upon completion.
- **Enrolment status** consists of full-time (students who enrolled in at least 60% of a full course load in at least one session in the academic year) or part-time (students who were enrolled in less than 60% of full course load in all sessions attended for the academic year).
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services).
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs. The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Income support among Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report provides a profile of 6,599 Albertan youth (aged 18 to 24 years old) who received income support at any point in 2008/09. Human Services provides financial benefits to individuals and families who do not have the resources to meet their basic needs, such as food, clothing and shelter. Client types are those with *barriers to full employment* and those *expected to work*. Youth who received income support while upgrading or training (*learners*) were excluded. Household types are singles or couples, with or without children. See *Definitions and Notes* (p.21) for details.

The report looks at the relationships between income support client type and household type and age, gender, region of residence, socio-economic status, educational achievement, mental health status, and health service use for youth who received income support. These youth are compared with youth who did not receive income support. An overview of cross-ministry service use for youth receiving income support is also included.

- 1.6% of youth received income support at some point in 2008/09. 54% of these were *barriers to full employment* clients and 46% were *expected to work* clients. 60% were *singles*.
- Females were over-represented among income support clients who were *singles* with children or *expected to work*; males were predominant among *singles* without children.
- Income support clients were more likely than youth (aged 18 to 20 years) not receiving income support to live in mid-sized centres, to live in low to middle socio-economic status neighbourhoods, to perform below expectations in high school, to receive services for a mental health condition, and to have high health service use or no health service use.
- Compared to youth who did not receive income support, income support clients were less likely to be in the Alberta Health Care Insurance Plan (AHCIP) registry or enrolled in a post-secondary institution, but were more likely to be receiving maltreatment-related intervention services. *Barriers to full employment* clients or *singles* without children were more likely than youth who did not receive income support to be enrolled in high school.

Income support among Albertan youth

Context

Income support is one of a broader suite of social programs provided by the various levels of government; other programs include supports for the elderly, the disabled, families, and the unemployed. Expenditures on income supports in Canada (known as *social assistance* in many jurisdictions) are the second largest of such programs, next to old age security programs.¹

A 2006 Albertan study found the largest proportion of income support clients was 20-29 years old (31%), while 9% of income support clients were 0-19 years old. The majority of individuals on income support who were working and *expected to work* were single parents (62%).² International literature suggests that youth are more likely to be on income support if they grew up in a family that relied on income support.^{3,4}

Key barriers to permanent employment for individuals who are able to work include mental health and addiction problems, lack of affordable childcare, lack of transportation, and poor skills in areas such as stress and conflict management or problem solving. The most common barriers to leaving income support include lack of work experience, health problems, child care issues, lack of a high school diploma, and lack of self-confidence.² Single parents and clients who have not graduated from high school are most likely to return to income support after leaving it.⁵

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Income support among Albertan youth

Income support client type
Albertan youth aged 18 to 24

Income support client type (Table 1)

These analyses look at Albertan youth (aged 18 to 24 years) who received income support at any point in 2008/09 by income support client type.

- 6,599 youth received income support services in 2008/09, representing 1.6% of 406,014 Albertan youth (aged 18 to 24 years).
- 54% of youth who received income support services were *barriers to full employment* clients, and 46% were *expected to work* clients.

Income support household type (Table 2)

Household type refers to the family composition of income support clients (aged 18 to 24 years).

- 60% of youth who received income support services were *singles*, followed by *singles with children* (19%), *couples with children* (11%) and *couples* (10%).

Income support household type
Albertan youth aged 18 to 24

Income support client type by income support household type
Albertan youth aged 18 to 24

Income support client type by household type (Table 3)

- Youth with *barriers to full employment* were more likely to be *singles* (72%) than youth *expected to work* (46%).
- Among youth *expected to work* there were more *singles with children* (32%) than among youth with *barriers to full employment* (8%).

Income support among Albertan youth

Income support client type by age (Table 4)

- At age 22 and 23 years, more youth were classified as *expected to work* than with *barriers to full employment*.
- In contrast, across all other ages there were more youth with *barriers to full employment*. The highest percentage (72%) of youth with *barriers to full employment* was among 18 year olds.

Income support household type by age
Albertan youth aged 18 to 24

Income support household type by age (Table 5)

- The percentage of youth who were *singles* without children was highest among 18 year olds (78%). The percentage of *singles* without children decreased as youth got older.
- Conversely the percentage of youth who were *couples with or without children* increased as youth got older.
- The percentage of youth on income support who were *singles with children* varied slightly across the age range for 19 to 24 year olds.

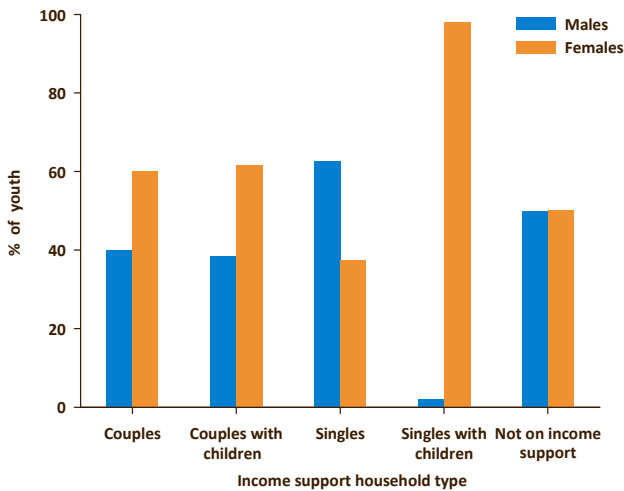

Income support client type by gender (Table 6)

- There were considerably more females (63%) than males among youth *expected to work*.
- There were slightly more males (53%) than females among youth with *barriers to full employment*.
- There were no gender differences for youth who did not receive income support.

Income support among Albertan youth

Income support household type by gender
Albertan youth aged 18 to 24

Income support household type by gender
(Table 7)

- *Singles with children* were overwhelmingly female (98%), while *singles* without children were predominantly male (63%).
- Female clients comprised a higher percentage of *couples with children* (60%) and *couples* without children (62%) than male clients (40% and 39% respectively).
- The percentage of females and males was equal among youth who did not receive income support.

Income support client type by region of residence (Table 8)

- Nearly a quarter of youth who received income support (whether *expected to work* or *with barriers to full employment*) lived in mid-sized centres, compared to 16% of youth who did not receive income support.

Income support client type by region of residence
Albertan youth aged 18 to 24

Income support household type by region of residence
Albertan youth aged 18 to 24

Income support household type by region of residence (Table 9)

- Youth who received income support were more likely to live in mid-sized centres than youth who did not receive income support.
- Region of residence varied only slightly across the different household types.

Income support among Albertan youth

Income support client type by socio-economic status (Table 10)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p.20).

- Youth who received income support (*with barriers to full employment and expected to work*) were more likely to live in the lowest or middle socio-economic status neighbourhoods than youth who did not receive income support.

Income support client type by socio-economic status (SES)
Albertan youth aged 18 to 24

Income support household type by socio-economic status (SES)
Albertan youth aged 18 to 24

Income support household type by socio-economic status (Table 11)

Only the highest and lowest socio-economic status groups are shown in this analysis. See *Definitions and Notes* (p.20).

- Youth who received income support tended to live in lower socio-economic status neighbourhoods than youth who did not, regardless of household type.
- Singles* without children tended to live in slightly better socio-economic status neighbourhoods than *singles with children*, *couples*, and *couples without children*.

Income support client type by educational achievement (Table 12)

This analysis describes youth (aged 18 to 20 years) who received any income support and were registered in Alberta's K-12 education system (not necessarily simultaneously) in 2008/09 and had educational achievement information available.

- 20% of youth with *barriers to full employment* and 37% of youth who were *expected to work* at some point in the year met or exceeded educational expectations. In contrast, 74% of youth who had not received income support at any time in the year met or exceeded educational expectations.

Income support client type by educational achievement
Albertan youth aged 18 to 20

Income support among Albertan youth

Income support household type by educational achievement
Albertan youth aged 18 to 20

Income support household type by educational achievement (Table 13)

Due to small numbers, household types were re-grouped into two categories; according to presence of children in the household.

- Youth who received income support at any point in the year were less likely to meet or exceed educational expectations than youth who had not received income support, regardless of household type.
- *Couples and singles without children* who received income support at any point in the year were slightly more likely to have met or exceeded educational expectations (26%) compared to *singles and couples with children* (24%).

Income support client type by mental health status (Table 14)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.21).

- Service use for mental health conditions was more common among youth who received income support than youth who did not.
- The highest rate of service use for mental health conditions (40%) was among youth who received income support with *barriers to full employment*, compared with 31% among youth *expected to work*, and 12% among youth who did not receive income support.

Income support client type by presence of a mental health condition
Albertan youth aged 18 to 24

Income support household type by presence of a mental health condition
Albertan youth aged 18 to 24

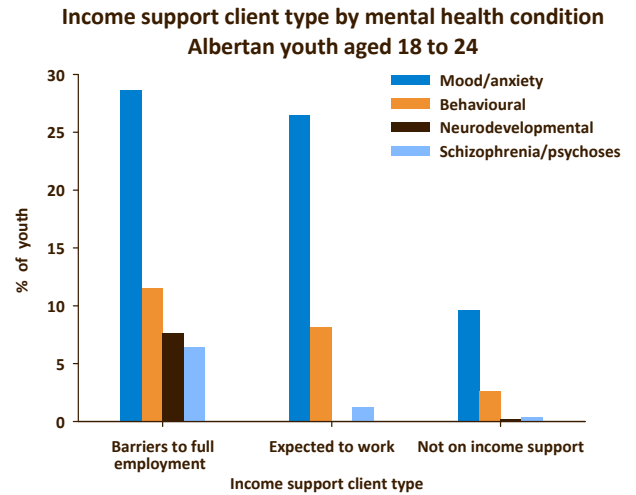

Income support household type by mental health status (Table 15)

- Service use for mental health conditions was higher among youth who received income support than among youth who did not.
- The highest rate (41%) was among *single* youth who received income support, compared with 32% among *singles with children*, 29% among *couples*, 25% among *couples with children* and 12% among youth who did not receive income support.
- Service use for mental health conditions was higher among *singles* with or without children, and lower among *couples* with or without children.

Income support among Albertan youth

Income support client type by mental health conditions (Table 16)

- All types of mental health conditions were most common among youth who received income support with *barriers to employment*.
- *Mood or anxiety* mental health conditions were almost three times higher among youth with *barriers to full employment* (29%) and those *expected to work* (27%) than among youth who did not receive income support (10%).

Income support household type by mental health condition (Table 17)

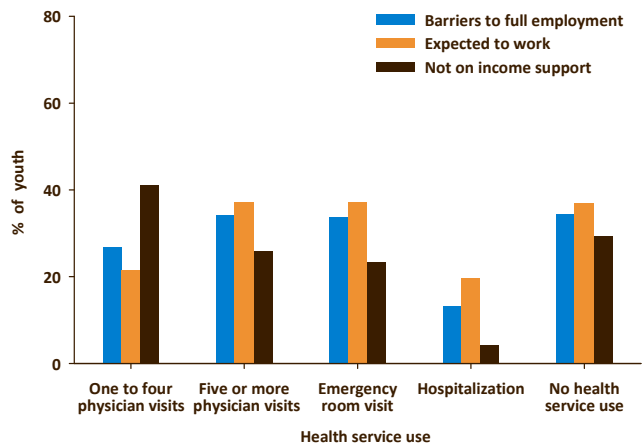

Income support household type by mental health condition (Table 17)

- All types of mental health conditions were most common among *singles* who received income support than among other groups, with the exception of mood/anxiety.
- The percentage of *mood or anxiety* mental health conditions among youth who received income support (range from 22% to 29%) was more than twice that of youth who did not receive income support (10%).
- *Singles* had the highest rate of *behavioural* conditions (14%), compared with 5% to 9% of other income support groups and 3% of youth who did not receive income support.

Income support client type by health service use (Table 18)

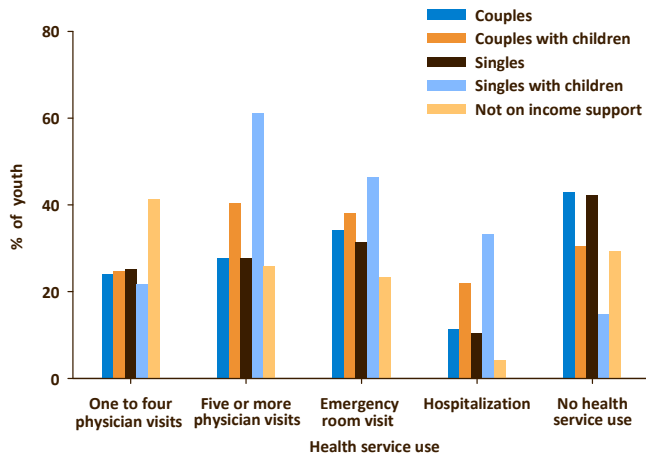

- Emergency room visits, hospitalizations and five or more physician visits were highest among youth *expected to work* than any other group.
- Youth *expected to work* were also more likely to have used no health services than any other group.
- Youth who did not receive income support had a higher percentage of one to four physician visits that youth who received income support.

Income support client type by health service use (Table 18)

Income support among Albertan youth

Income support household type by health service use
Albertan youth aged 18 to 24

Income support household type by health service use (Table 19)

- *Singles with children* were more likely to have five or more physician visits, to have had an emergency room visit, or to have been hospitalized than any other group.
- *Couples* and *singles* were more likely to have no health service use than any other group.
- Youth who did not receive income support were more likely to have one to four physician visits than all other groups.

Income support client type by cross-service use (Table 20)

Youth were considered in this analysis if they were registered with the Alberta Health Care Insurance Plan (AHCIP; See *Definitions and Notes* (p.20). The effects should be interpreted with caution; they cannot be generalized to youth not registered with AHCIP (28% of youth who received income support were not registered with AHCIP).

- Youth who received income support with *barriers to full employment* were more likely to have received maltreatment-related intervention services and to be enrolled in the K-12 education system (not necessarily simultaneously) than youth *expected to work* and those that did not receive income support.

Income support client type by cross-service use
Albertan youth aged 18 to 24

Income support household type by cross-services use
Albertan youth aged 18 to 24

Income support household type by cross-service use (Table 21)

- *Singles* who received income support in 2008/09 were more likely to have enrolled in Alberta's K-12 education system (not necessarily simultaneously) than all other income support household groups, including youth who did not receive income support.
- More *singles with children* who received income support in 2008/09 were enrolled in post-secondary institutions (not necessarily simultaneously) than any other income support household group.

Income support among Albertan youth

Tables

Table 1. Number and percent of youth by income support client type, Albertan youth aged 18 to 24 years, 2008/09

	Income support client type	Total
Number of youth	Barriers to full employment	3,557
	Expected to work	3,042
	Any income support	6,599
	Not on income support	399,415

*Only youth registered in the Alberta Health Care Insurance Plan were included in this analysis

Income support among Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁶. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Income support among Albertan youth

Definitions and Notes (continued)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health 's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with the Alberta Health Care Insurance Plan for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁷. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.
- The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment). *Use this note only if you use client type in your analyses.*
- **Household types** include singles (one adult in the household) with or without children, and couples (two adults in the household) with or without children.
- **Physician visits** reflect fee claims made by physicians for services provided when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta.
- Participation in **post-secondary** education refers to enrolment in a post-secondary institution in Alberta. Youth enrolled in apprenticeship programs were not included.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the "**health registry**" refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible. *Use this note only if you have an analysis subset to those in the registry.*

Income support among Albertan youth

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Educational experiences of Albertan youth with income support activity

Child and Youth Data Laboratory (CYDL)

Report for Experiences of Albertan Youth Project

Key findings

This report is an overview of the educational experiences of 2,445 Albertan youth (aged 18 to 24 years old) who at any point in 2008/09 received income support. Human Services provides financial benefits to individuals and families who do not have the resources to meet their basic needs, such as food, clothing and shelter. Client types are those with *barriers to full employment* and those *expected to work*. Youth who received income support while upgrading or training (*learners*) were excluded. Household types are singles or couples, with or without children. For high school students, school authority type is considered. For post-secondary students, institution type, credential type, and enrolment status are considered. See *Definitions and Notes* for details. Youth were *not necessarily simultaneously receiving income support and attending high school or post-secondary institutions*.

The report describes client types and household types of youth with any income support activity who were enrolled (not necessarily at the same time) in an educational program, as well as relationships with age, gender, region of residence, socio-economic status, mental health status, and health service use. These youth were compared to youth enrolled in high school or post-secondary programs but not receiving income support.

- 549 Albertan youth (aged 18 to 20) who had any income support activity were registered in high school, and 378 Albertan youth (aged 18 to 24) who had any income support activity were enrolled in post-secondary institutions at some point in 2008/09.
- Youth with any income support activity who were registered in high school were most likely to be clients with *barriers to full employment*, single, female, living in large city centres, living in the lowest socio-economic status neighbourhoods, receiving services for a mental health condition, having a high rate of health service use, and performing below educational expectations.
- Youth with any income support activity who were enrolled in post-secondary institutions were likely to be clients with *barriers to full employment*, female, single, part-time students, enrolled in community or independent institutions and enrolled in *no credential* programs.

Context

Income support is one of a broader suite of social programs provided by the various levels of government; other programs include supports for the elderly, the disabled, families, and the unemployed. Income support programs are designed to assist individuals in striving toward self-sufficiency; obtaining an education is a potential road to self-sufficiency.

Previous Alberta data indicate that the largest proportion of income support clients is 20-29 years old (31%), while 9% of income support clients are 0-19 years old. Approximately one third of these individuals identify themselves as Aboriginal and one quarter identify themselves as someone with a disability.¹ International literature suggests that youth are more likely to be on income support if they grew up in a family that relied on income support.^{2,3}

Barriers to permanent employment for individuals who are able to work include lack of affordable childcare, lack of transportation, existence of mental health and addiction conditions, and poor skills in areas such as stress and conflict management or problem solving.¹

Lack of education has been shown to be a key barrier to leaving income support. Compared to those with higher education, individuals without a high school diploma have a greater likelihood of re-entering income support after leaving it.⁴ Income support recipients who graduate from college are also more likely to leave income support compared to those with less education.³

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth

Educational experiences of Albertan youth

Mental health status of Albertan youth

Family Support for Children with Disabilities services received by Albertan youth

Maltreatment-related intervention services received by Albertan youth

Physician visits by Albertan youth

Emergency room visits by Albertan youth

Hospitalizations of Albertan youth

Offence charges among Albertan youth

Corrections involvement among Albertan youth

Post-secondary students in Alberta

Income support among Albertan youth

Educational experiences of Albertan youth with income support activity

Least advantaged and most advantaged Albertan youth

Educational experiences of Albertan youth with income support activity

Income support status by high school enrolment (Table 1)

The first part of this report considers analyses of youth (aged 18 to 20 years) who were enrolled in Albertan high schools in 2008/09 by their income support status.

- Of 2,445 youth (18 to 20 years old) who had any income support activity in 2008/09, 23% (549 youth) were enrolled in high school at some point in the year.
- 17%, 28,931 youth out of 170,679 Albertan youth (18 to 20 years old) with no income support activity in 2008/09 were enrolled in high school. The fact that youth with no income support activity were less likely to be enrolled in high school may be partially due to many youth completing high school education by 18 years of age and transitioning into post-secondary or into the work force.

Income support status by high school enrolment status
Albertan youth aged 18 to 20

Income support client type
Albertan youth aged 18 to 20 enrolled in high school

Income support client type by high school enrolment (Table 2)

- The majority (77%) of high school students with any income support activity were youth that had *barriers to full employment*.

Income support household type by high school enrolment (Table 3)

In this analysis, youth (18 to 20 years old) with any income support activity who enrolled in high school at some point in 2008/09 were analyzed by household type (or family composition).

- The majority of high school students with any income support activity were *singles* (79%), followed by *singles with children* (12%), *couples* (5%) and lastly *couples with children* (4%).

No further analysis by household type was conducted due to small numbers in some categories.

Income support household type
Albertan youth aged 18 to 20 enrolled in high school

Educational experiences of Albertan youth with income support activity

Income support status by age
Albertan youth aged 18 to 20 enrolled in high school

Income support status by age, high school students (Table 4)

- Youth enrolled in high school who received any income support as *expected to work clients* at some point in the year were most likely to be aged 19 years (40%).
- The majority of youth with no income support activity or with any income support activity with *barriers to full employment* were 18 years old (70% and 71% respectively). In contrast among youth *expected to work*, 18 year olds comprised 38% of the population.

Income support client type by age, high school students (Table 5)

- The majority of 18 and 19 year old high school students with any income support activity had *barriers to full employment* (86% and 68% respectively).
- Most 20 year old high school students with any income support activity were *expected to work* (58%).

Income support client type by age
Albertan youth aged 18 to 20 enrolled in high school

Income support status by gender
Albertan youth aged 18 to 20 enrolled in high school

Income support status by gender, high school students (Table 6)

- Youth enrolled in high school with any income support activity as *expected to work clients* were predominantly females (79%), compared to 44% females among youth with any income support activity with *barriers to full employment* and 49% female among youth with no income support activity.

Educational experiences of Albertan youth with income support activity

Income support status by region of residence, high school students (Table 7)

- Youth enrolled in high school with any income support activity were most likely to live in large city centres, regardless of their income support status.
- Youth enrolled in high school with any income support activity as *expected to work* clients were more likely to live in mid-sized centres than other groups.

Income support status by socio-economic status
Albertan youth aged 18 to 20 enrolled in high school

Income support status by socio-economic status, high school students (Table 8)

Socio-economic status (SES) captures the social and material environments in which youth live. See *Definitions and Notes* (p.23).

- High school students with any income support activity were more likely to come from the lowest socio-economic status neighbourhoods than high school students without any income support activity.

Income support status by educational achievement, high school students (Table 9)

- High school students with any income support activity as *expected to work* clients were nearly twice as likely (37%) to meet or exceed educational expectations than high school students with any income support activity as *barriers to full employment* clients (20%).
- High school students with no income support activity were twice as likely to meet or exceed educational expectations, than those with any income support activity.

Income support status for youth meeting or above educational expectations
Albertan youth aged 18 to 20 enrolled in high school

Educational experiences of Albertan youth with income support activity

Income support status by school authority type
Albertan youth 18 to 20 enrolled in high school

Income support status by school authority type, high school students (Table 10)

School authority types within the K-12 education system include public, separate, Francophone, charter, private and other. See *Definitions and Notes* (p.24).

- High school students (aged 18 to 20 years) with any income support activity were slightly more likely to be enrolled in a public school (81%) than youth with no income support activity (78%).

Income support status by mental health status, high school students (Table 11)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.24).

- Of youth who attended high school with any income support activity as *barriers to full employment* clients, 58% used services for a mental health condition.
- The rate was lower for youth enrolled in high school with any income support activity as *expected to work* clients (27%) and for youth with no income support activity (14%).

Income support client type by presence of a mental health condition
Albertan youth aged 18 to 20 enrolled in high school

Income support status by health service use
Albertan youth aged 18 to 20 enrolled in high school

Income support status by health service use, high school students (Table 12)

- High school students who had any income support activity were more likely to have five or more physician visits, to have visited an emergency room, or to have been hospitalized than youth enrolled in high school with no income support activity.

Educational experiences of Albertan youth with income support activity

Income support status by post secondary enrolment (Table 13)

From this point onward, analyses focus on youth (aged 18 to 24 years) with any income support activity in 2008/09 who were enrolled in post-secondary institutions at some other point in the year.

- Of 6,599 Albertan youth (18 to 24 years old) with any income support activity, 6%,378 youth were enrolled in post-secondary institutions.
- 28%, 399,415 youth out of 399,415 Albertan youth (18 to 24 years old) with no income support activity were enrolled in post-secondary institutions.

Income support status by post-secondary enrolment status
Albertan youth aged 18 to 24

Income support client type
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by post-secondary enrolment (Table 14)

- Over half (56%) of post-secondary institution students with any income support activity were youth with *barriers to full employment*.

Income support household type by post-secondary institution enrolment (Table 15)

- Over half (52%) of youth enrolled in post-secondary institutions with any income support activity were *singles*.
- A small proportion (8%) of youth enrolled in post-secondary institutions with any income support activity were *couples*.

No further analysis by household type was conducted due to small numbers in some of the categories.

Income support household type
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Educational experiences of Albertan youth with income support activity

Income support status by age, post-secondary students (Table 16)

- Youth enrolled in post-secondary institutions with any income support activity were older on average than youth enrolled in post-secondary institutions with no income support activity.

Income support status by gender, post-secondary students (Table 17)

- A higher proportion (82%) of youth enrolled in post-secondary institutions with any income support activity who were *expected to work* were female, compared to 61% among youth with any income support activity with *barriers to full employment*, and 57% among youth with no income support activity.

Income support status by gender
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by region of residence
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by region of residence, post-secondary students (Table 18)

- More youth with any income support activity were from mid-sized centres than youth with no income support activity.
- 20% of youth with any income support activity who were *expected to work* resided in rural areas, compared to 16% among youth with any income support activity with *barriers to full employment* and 14% among youth with no income support activity.

Educational experiences of Albertan youth with income support activity

Income support status by socio-economic status, post-secondary students (Table 19)

Socio-economic status captures the social and material environments in which youth live. See *Definitions and Notes* (p.23).

- 44% of youth with any income support activity who were enrolled in post-secondary institutions lived in the lowest socio-economic status neighbourhoods, compared to 18% of youth with no income support activity.
- Youth with no income support activity who were enrolled in post-secondary institutions were more likely (27%) to live in the highest socio-economic status neighbourhoods than youth with any income support activity (11%).

Income support status by socio-economic status
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by institution type
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by institution type, post-secondary students (Table 20)

- The majority (65%) of post-secondary students with any income support activity were enrolled in community (e.g. Norquest College) or independent institutions (e.g. St. Mary's University College), compared to 17% of post-secondary students with no income support activity.

Income support status by credential type, post-secondary students (Table 21)

Credential post-secondary programs include bachelor/applied/graduate level programs and certificate/diploma programs; other programs with *no credential* received upon completion. See *Definitions and Notes* (p.25).

- Youth enrolled in post-secondary institutions with any income support activity who were *expected to work* were less likely (33%) to be enrolled in a *credential* program than youth with any income support activity with *barriers to full employment* (45%) or youth with no income support activity (79%).

Income support status by credential type
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Educational experiences of Albertan youth with income support activity

Income support client type by enrolment status
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by enrolment status, post-secondary students (Table 22)

- Youth who had any income support activity with *barriers to full employment* were most likely (35%) among the three groups to enroll on a part-time basis, followed by youth *expected to work* (30%) and youth with no income support activity (19%).

Income support status by mental health status, post-secondary students (Table 23)

Mental health status refers to presence or absence of a mental health condition. Mental health conditions are defined as receipt of services related to mental health conditions; that is, receipt of services is used here as a proxy for confirmed presence of a mental health condition. See *Definitions and Notes* (p.24).

- Post-secondary students with any income support activity were over three times as likely to have received services for a mental health condition than youth with no income support activity.

Income support status by presence of a mental health condition
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by health service use
Albertan youth aged 18 to 24 enrolled in post-secondary institutions

Income support status by health service use, post-secondary students (Table 24)

- Post-secondary students with any income support activity were more likely than youth with no income support activity to have had five or more physician visits, to have visited an emergency room, or to have been hospitalized at least once.
- Youth with no income support activity were more likely to have one or more physician visits, or to have had no health service use.

Educational experiences of Albertan youth with income support activity

Tables

Table 1. Number and percent of youth enrolled in high school by income support status, Albertan youth aged 18 to 20 years, 2008/09

	Enrolled in high school	Income support status		
		Any income support activity	No income support activity	Total
Number of youth	Yes	549	28,931	29,480
	No	1,896	139,303	141,199
	Total	2,445	168,234	170,679

*Health service use categories are not mutually exclusive

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided⁵. Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility. Educational achievement was categorized as *above, meeting, or below expectations* for a student’s age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in ‘other’ schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

Definitions and Notes (*continued*)

- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health's databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with Alberta Health and Wellness for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)⁶. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Income support** refers to financial benefits provided to individuals and couples who cannot meet their basic needs.
- The **client types** for income support clients are *expected to work* (clients who are looking for work, working, or unable to work in the short term) and *barriers to full employment* (clients who have difficulty working because of a chronic mental or physical health problem or because of multiple barriers to employment).
- **Household types** include singles (one adult in the household) with or without children, and couples (two adults in the household) with or without children.
- Participation in **education** refers to enrolment in the kindergarten to grade 12 education system in Alberta. No data were available for students who attended schools on First Nations reserves or in Lloydminster.
- **School authority types**

There is one publicly-funded system of education in Alberta. The public system includes public, separate, Francophone and charter schools.

 - **Public** schools are non-denominational schools.
 - **Separate** schools are established under rights guaranteed by the Constitution of Canada for the minority religion (Protestant or Roman Catholic).
 - **Francophone** schools provide instruction in French to children whose parents have rights under section 23 of the Canadian Charter of Rights and Freedoms.
 - **Charter** schools are autonomous public schools designed to meet the needs of students through a specific program or approach. They must be non-religious.

Private schools operate outside the public education system. Private schools may charge tuition and other fees. There are two kinds of private schools.

 - Accredited private schools must offer the Alberta Program of Studies with certificated teachers; they may be partially funded or non-funded.
 - Registered private schools are not required to offer the Program of Studies and are not funded.

Other schools are accredited post-secondary institutions offering high school courses for credit to adults.

Definitions and Notes (*continued*)

- **Post-secondary** participation refers to enrolment in a post-secondary institution in Alberta. When a student was enrolled in more than one session in the study year, one session was chosen to provide values for credential type, enrolment status, and institution type for that individual. Full-time enrolments were chosen over part-time, winter session enrolments were chosen over fall sessions, and fall sessions were chosen over spring and summer enrolments. If only spring or summer enrolments occurred, the session was randomly chosen from among the spring and summer enrolments.
- **Credential types** for post-secondary programs include bachelor/applied/graduate programs (also called degree-granting), certificate/diploma programs, and programs with no credential received upon completion.
- **Enrolment status** for post-secondary programs consists of full-time (students who enrolled in at least 60% of a full course load in at least one session in the academic year) or part-time (students who were enrolled in less than 60% of full course load in all sessions attended for the academic year).
- **Institution types** for post-secondary programs included comprehensive academic and research institutions (Athabasca University, University of Alberta, University of Calgary, University of Lethbridge), baccalaureate and applied studies institutions (Grant MacEwan and Mount Royal), polytechnical institutions (NAIT and SAIT), comprehensive community institutions (e.g., Bow Valley College, NorQuest College, Red Deer College), independent academic institutions (e.g., Concordia University College of Alberta, St. Mary's University College), and specialized arts and culture institutions (Alberta College of Art and Design and The Banff Centre).
Emergency room visits refer to visits to emergency departments for assessment or treatment.
- **Hospitalizations** refer to admissions to hospital for assessment or treatment.
- **Physician visits** reflect fee claims made by physicians when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.

Educational experiences of Albertan youth with income support activity

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General

Least and most advantaged Albertan youth

Child and Youth Data Laboratory (CYDL)

Report for *Experiences of Albertan Youth Project*

Key findings

This report provides a profile of the 2,281 least and 7,517 most advantaged Albertan youth between 12 and 17 years who were receiving provincial government services in 2008/09. *Least advantaged* is defined here as youth who were performing below educational expectations in the K-12 education system, who had a mental health condition, and who were living in the lowest socio-economic status neighbourhoods. Conversely, *most advantaged* youth performed above educational expectations, did not have a mental health condition, and lived in the highest socio-economic status neighbourhoods.

The relationships between advantage status and age, gender, region of residence, and health service use are examined for least and most advantaged youth, in comparison to remaining Albertan youth. The cross-ministry service use of least and most advantaged youth is also considered. The report concludes with a look at the educational achievement of youth experiencing challenges.

- 1.1% of Albertan youth were least advantaged, and 3.6% were most advantaged.
- The least advantaged youth were more likely than the remaining youth to be male, live in rural areas, be hospitalized, visit an emergency room, or receive maltreatment-related services; most advantaged youth were less likely than remaining youth to have these characteristics.
- Additionally, least advantaged youth were more likely than the remaining youth to visit physicians five or more times, to receive Family Support for Children with Disabilities services, to be charged with an offence, or to be involved in corrections. *Psychiatric or pregnancy-related* hospitalizations and *mental or behavioural* emergency room visits were more common among hospitalizations and emergency room visits for least advantaged youth than for the remaining youth.
- Additional analyses looked at challenged youth (such as youth involved in corrections or receiving maltreatment-related services), and found that, despite the challenges they faced, some youth performed well in school. Better educational outcomes were associated with being female, living in a higher socio-economic status neighbourhood, not having a mental health condition, and lower rates of health service use.

Least and most advantaged Albertan youth

Context

Socio-economic status, mental health, and education have interrelated effects on youth. Socio-economic status is a strong predictor of academic outcomes, with lower grades and more school absences for low-income students.¹ Health care services are used twice as much by individuals in the lowest income situations compared to those in the highest income situations.² Mental health problems in youth are associated with aggression and delinquent behaviour,³ negative impacts on families, long-term impairments and high costs for society.⁴ Low educational achievement is associated with increased risk for delinquency in adolescence,⁵ and difficulties obtaining higher education and employment in adulthood.⁶

Living in an advantaged neighbourhood results in better outcomes for both high and low socio-economic status children;⁷ the outcomes for all youth become more positive as the average socio-economic status in a school community increases.⁸ Positive mental health can serve as a protective factor against negative behaviours in adolescence,³ and education can increase positive health,⁹ employment and income outcomes⁶ across the life course.

Some youth are resilient to the negative effects of the challenges they experience.¹⁰ Individual, family and community factors contribute to this resilience.¹⁰ For example, in one study, youth receiving child intervention services were more likely to succeed if they remained in school longer, which was associated with protective factors such as stability in their education, exposure to positive social activities, and mentorship from an adult who provided guidance and support.¹⁰

The project

The current project, **Experiences of Albertan Youth**, is focused on basic understanding of the experiences of Albertan youth within and across ministries, as they relate to key indicators (age, gender, socio-economic status, educational achievement, and mental health status). It is the first project in a planned series that will link and analyze administrative data on children and youth in Alberta to inform policy, programs, and research.

List of reports for the project

Socio-economic status of Albertan youth
Educational experiences of Albertan youth
Mental health status of Albertan youth
Family Support for Children with Disabilities services received by Albertan youth
Maltreatment-related investigations among Albertan youth
Maltreatment-related intervention services received by Albertan youth
Physician visits by Albertan youth

Emergency room visits by Albertan youth
Hospitalizations of Albertan youth
Offence charges among Albertan youth
Corrections involvement among Albertan youth
Post-secondary students in Alberta
Income support among Albertan youth
Educational experiences of Albertan youth with income support activity
Least advantaged and most advantaged Albertan youth

Least and most advantaged Albertan youth

Least and most advantaged youth by age (Tables 1 and 2)

This analysis considers the least and most advantaged youth (aged 12 to 17 years) in Alberta in 2008/09. *Least advantaged* is defined here as youth who were performing below expectations in school, had a mental health condition, and were living in the most deprived socio-economic neighbourhoods. Conversely, *most advantaged* is defined as youth who performed above expectations, had no mental health condition and were living in the most advantaged socio-economic neighbourhoods. The *remaining Albertan youth* refer to those youth in this sub-population who were neither least nor most advantaged. All of these youth were registered with Education and the Alberta Health Care Insurance Plan.

- 1.1% of youth (2,281 youth) were the least advantaged in Alberta, while 3.6% (7,517 youth) were the most advantaged (see Table 1).
- The percentage of 12 year olds is lower than other ages because a proportion of 12 year old Albertan youth is missing from the overall study population; see *Definitions and Notes* (p. 19).
- The most common age for least advantaged youth was 15 years (21.7% of least advantaged), while 15 and 16 were the most common ages for most advantaged youth (22.7% and 22.5% of most advantaged youth, respectively). The remaining youth were fairly evenly distributed across the age range (other than the 12 year olds).

Least and most advantaged youth by gender (Table 3)

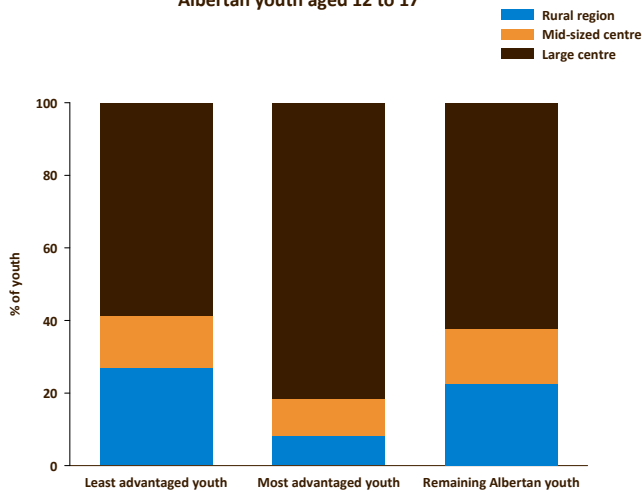

- Female youth between 12 and 17 years tended to be advantaged over same-age males with respect to their socio-economic status, mental health status and educational achievement.
- Among the least advantaged youth, 57% were males and 43% were females. Among the most advantaged, 55% were females and 45% were males.

Advantage status by gender
Albertan youth aged 12 to 17

Least and most advantaged Albertan youth

Advantage status by region of residence
Albertan youth aged 12 to 17

Least and most advantaged youth by region of residence (Table 4)

- The most advantaged youth were much more likely to be living in large centres (81%) than rural regions (8%).
- Among the least advantaged youth, 27% lived in rural regions; this is similar to the proportion of rural residents among the remaining Albertan youth (23%).

Least and most advantaged youth by number of physician visits (Table 5)

- Making one to two physician visits per year was more common among the most advantaged youth (39%) than among the least advantaged (17%).
- The least advantaged youth between 12 and 17 years were considerably more likely to see a physician five or more times in a year than the most advantaged youth (least advantaged, 59%, most advantaged, 25%).

Advantage status by number of physician visits
Albertan youth aged 12 to 17

Advantage status by number of hospitalizations
Albertan youth aged 12 to 17

Least and most advantaged youth by number of hospitalizations (Table 6)

- Overall, hospitalizations during the year were rare among the most advantaged youth (1.0%) and remaining Albertan youth (2.2%).
- However, among the least advantaged youth, 11.4% were hospitalized at least once during the year.

Least and most advantaged Albertan youth

Least advantaged youth by type of hospital service (Table 7)

Because the most advantaged youth did not have a mental health condition, they did not appear at all in the *psychiatric* category. Analyses were excluded for all other categories among the most advantaged group due to low numbers.

- Psychiatric services were the most common among hospitalizations of least advantaged youth (40% of hospitalizations), while hospitalizations for surgery or procedures were the most common type among hospitalizations of remaining Albertan youth (41% of hospitalizations).
- Pregnancy-related services were more common among hospitalizations for the least advantaged youth (9%) than for the remaining Albertan youth (6%).

Least advantaged youth by type of hospital service
Albertan youth aged 12 to 17

Type of hospital service, main service code examples

Category name	Examples
General medicine	Gastro-intestinal, respiratory, allergy, etc.
Surgery/procedure	Orthopaedic surgery, urology, etc.
Psychiatry	Psychiatry or pediatric psychiatry
Pregnancy-related	Deliveries, antepartum obstetrics, abortions

Advantage status by type of hospital service and gender
Alberta youth aged 12 to 17

Least advantaged youth by type of hospital service and gender (Table 8)

Because pregnancy-related visits were relevant to females only, this category was excluded from this gender analysis. Due to low numbers, the most advantaged youth were excluded from this analysis.

- 47% of hospitalizations among least advantaged females were for psychiatric services, compared to 41% of hospitalizations among males.
- The percentage of hospitalizations for surgeries or procedures was higher among hospitalizations for least advantaged males (22%) than females (10%).

Least and most advantaged Albertan youth

Advantage status by number of emergency room visits
Albertan youth aged 12 to 17

Least and most advantaged youth by number of emergency room visits (Table 9)

- Among the most advantaged youth, 86% did not visit an emergency room in 2008/09, compared to 51% among the least advantaged youth and 75% among the remaining Albertan youth.
- Two or more emergency room visits were substantially more common among the least advantaged youth (29%), compared to the most advantaged (4%) and remaining Albertan youth (10%).

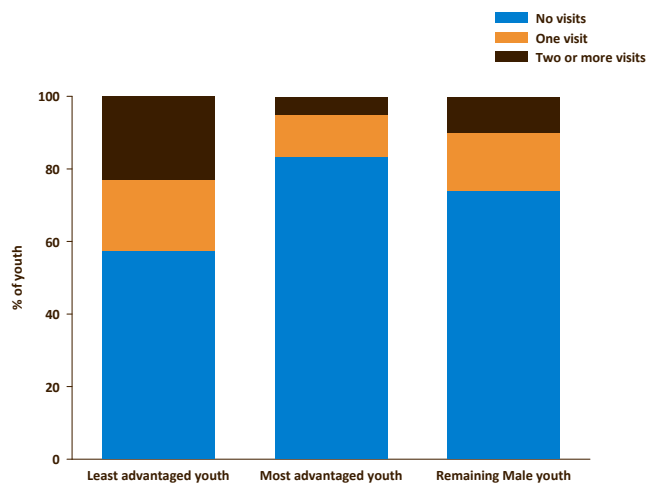

Least and most advantaged youth by number of emergency room visits and gender (Table 10)

- Emergency room visits varied by gender among the least advantaged youth. Females were more likely than males to visit an emergency room during the year. In contrast, among the most advantaged youth, males were more likely than females to have emergency room visits.
- Among the least advantaged youth, females (36%) were considerably more likely than males (23%) to have visited an emergency room two or more times in 2008/09. However, among the most advantaged youth, more males (17%) than females (12%) had at least one emergency room visit during the year.
- There were minor gender differences for the remaining Albertan youth.

Advantage status by number of emergency room visits
Female Albertan youth aged 12 to 17

Advantage status by number of emergency room visits
Male Albertan youth aged 12 to 17

Least and most advantaged Albertan youth

Least and most advantaged youth by reason for emergency room visit (Table 11)

- Among emergency room visits, *injury or poisoning* accounted for 55% of most advantaged youth visits, compared to 27% of least advantaged youth visits, and 40% of remaining Albertan youth visits.
- 18% of least advantaged youth visits were due to *mental or behavioural* issues compared to 3% of visits among the remaining Albertan youth. Because the most advantaged youth did not have a mental health condition, they did not appear in the *mental or behavioural* category.

Advantage status by reason for emergency room visit
Albertan youth aged 12 to 17

Sample reasons for emergency room visits

Reason for emergency room visit	Examples
Injury/poisoning	Wound, fracture, sprain, allergy unspecified, etc.
Other	Non-infective gastroenteritis (including diarrhoea), urinary tract infections, lower back pain, etc.
Influencing factors	Cast removal, attention to surgical dressing and sutures, chemotherapy, etc.
Signs/symptoms	Headache, abdominal pain, chest pain, etc.
Respiratory	Sore throat, upper respiratory infection, asthma, etc.
Mental/behavioural	Depression, anxiety, mental and behavioural disorders due to use of alcohol or other drugs or psychoactive substances, etc.

Advantage status by reason for emergency room visit and gender
Albertan youth aged 12 to 17

Least and most advantaged youth by reason for emergency room visit and gender (Table 12)

- Among emergency room visits for least advantaged youth, male visits (34%) were more likely than female visits (22%) to be for *injury or poisoning*, while female visits (23%) were more likely than male visits (18%) to be related to *other* reasons (diarrhoea, lower back pain, etc.).
- Out of all emergency room visits among most advantaged youth, male visits (60%) were also more likely than female visits (49%) to be for *injury or poisoning*, while female visits accounted for a greater percentage of visits for *signs or symptoms* (15% of female versus 8% of male visits).

Least and most advantaged Albertan youth

Least and most advantaged youth receiving maltreatment-related investigation or intervention services (Table 13)

This analysis considers the least and most advantaged youth (aged 12 to 17 years) who received maltreatment-related child investigation or intervention services during 2008/09.

- Among the least advantaged youth, 30.9% (705 youth) were receiving maltreatment-related investigation or intervention services compared to 3.4% of the remaining Albertan youth.
- A small minority of the most advantaged youth were receiving maltreatment-related investigation or intervention services (0.2%; 13 youth).

Advantage status by youth receiving maltreatment-related investigation or intervention services
Albertan youth aged 12 to 17

Least advantaged youth receiving services from Family Support for Children with Disabilities (FSCD)
Albertan youth aged 12 to 17

Least advantaged youth receiving services from Family Support for Children with Disabilities (Table 14)

This analysis considers the least advantaged youth (aged 12 to 17 years) who received services from FSCD during 2008/09.

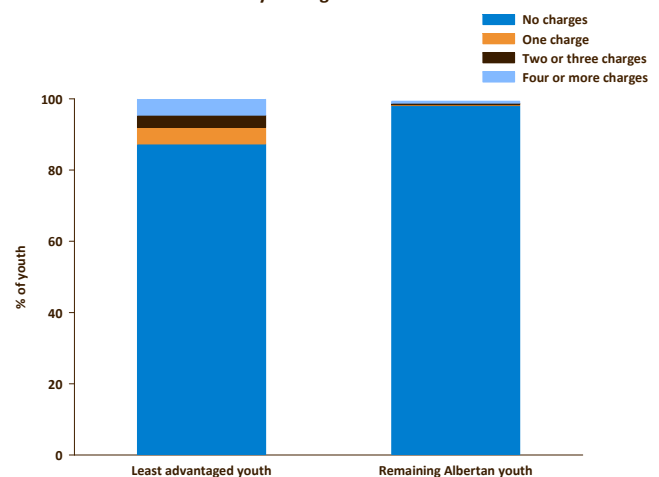

- Among the least advantaged youth, 18.9% (432 youth) were receiving services from FSCD, compared to 1.1% (2,209 youth) among the remaining Albertan youth (excluding the most advantaged youth). This high proportion is due in part to the inclusion of FSCD data in the development of the mental health measure used as part of the definition of most and least advantaged status.

Least advantaged youth by number of charges (Table 15)

This analysis considers the least advantaged youth (aged 12 to 17 years) who received offence charges during 2008/09. Due to the low number of most advantaged youth with offence charges, they were excluded from this analysis.

- Among the least advantaged youth, 87.3% (1,991 youth) had no offence charges.
- However, 4.6% (105 youth) had four or more offence charges compared to 0.5% (966 youth) of the remaining Albertan youth.

Advantage status by number of charges
Albertan youth aged 12 to 17

Least and most advantaged Albertan youth

Least advantaged youth by corrections involvement
Albertan youth aged 12 to 17

Least advantaged by corrections involvement (Table 16)

This analysis considers least advantaged youth (aged 12 to 17 years) who were involved in corrections, including youth who were in custody (in which a sentence is served in a young offender facility) or who had a community sentence or pre-trial supervision. Due to the small numbers of most advantaged youth involved in corrections, they were excluded.

- Among the least advantaged youth, 11.4% (260 youth) had some form of corrections involvement compared to 1.6% among the remaining Albertan youth (excluding the most advantaged youth).

Representation of least advantaged youth by type of ministry service or ministry involvement

Number and percent of youth registered in both Alberta's K-12 education system and the Alberta Health Care Insurance Plan by least advantage status and representation in ministry service or ministry involvement, Albertan youth aged 12 to 17 years, 2008/09

Type of ministry service/involvement	Percent and number of least advantaged youth by ministry service/involvement type	Total number of Albertan youth (aged 12 to 17) by ministry service/involvement type	Ratio*
Maltreatment-related investigation or intervention services	705, 9.2%	7,664	8.4
Family Support for Children with Disabilities services	432, 16.3%	2,646	14.8
Offence charges	290, 7.2%	4,053	6.5
Corrections (custody)	81, 13.4%	603	12.2
Corrections (community)	252, 7.3%	3,474	6.6

*Least advantaged youth make up only 1.1% (2, 281 youth) of the total population considered in this analysis. The least advantaged to total population ratio is the ratio between the percentage of youth who were least advantaged in a given ministry service/involvement group and percentage of youth who were the least advantaged in the total population (1.1%). A ratio value of over 1 indicates the over-representation of youth in a given type of ministry service or ministry involvement.

This analysis considers the proportion of least advantaged youth (aged 12 to 17 years) who received maltreatment-related investigation or intervention services, or who were charged with an offence, or were involved in corrections (custody or community). The most advantaged youth were not included due to the low representation of these youth in the types of service involvement discussed in this analysis.

- 9.2% of youth receiving maltreatment-related investigation or intervention services were least advantaged.
- 16.3% of youth receiving services from FSCD were least advantaged.
- 7.2% of youth with offence charges, 7.3% of youth involved in community corrections, and 13.4% of youth involved in custody corrections fell into the category of least advantaged youth.
- Overall, the least-advantaged youth in Alberta's 12 to 17 year old population were over-represented in these service involvements, relative to the 1.1% of the total population that was least advantaged. The ratios in the table indicate that the over-representation is large in magnitude.

Least and most advantaged Albertan youth

Youth experiencing challenges by socio-demographic characteristics and educational achievement

Number and percent of youth experiencing challenges by socio-demographic characteristics and educational achievement, Albertan youth aged 12 to 17 years registered in Alberta's K-12 education system and the Alberta Health Care Insurance Plan, 2008/09

Socio-demographic characteristics	Educational achievement					
	Below expectations		Meeting/above expectations		Total	
	Youth with challenges	Youth with no challenges	Youth with challenges	Youth with no challenges	Youth with challenges	Youth with no challenges
Age						
12	482, 6.0%	2,798, 7.6%	436, 7.5%	14,503, 8.2%	918, 6.6%	17,301, 8.1%
13	1,039, 13.0%	6,029, 16.3%	1,156, 19.8%	34,132, 19.3%	2,195, 15.8%	40,161, 18.8%
14	1,449, 18.1%	7,431, 20.1%	1,001, 17.1%	33,651, 19.0%	2,450, 17.7%	41,082, 19.2%
15	1,696, 21.2%	7,751, 21.0%	1,009, 17.3%	33,466, 18.9%	2,705, 19.5%	41,217, 19.3%
16	1,741, 21.7%	6,635, 18.0%	1,091, 18.7%	31,251, 17.7%	2,832, 20.4%	37,886, 17.7%
17	1,606, 20.4%	6,234, 16.9%	1,153, 19.7%	29,765, 16.8%	2,754, 19.9%	35,999, 16.8%
Total	8,013, 100%	36,878, 100%	5,846, 100%	176,768, 100%	13,859, 100%	213,646, 100%

Total	7,975, 100%	36,399, 100%	5,824, 100%	175,217, 100%	13,799, 100%	211,616, 100%

This analysis and the next one consider a different conceptualization of disadvantaged youth than in previous analyses: those who were experiencing identified challenges during 2008/09. *Youth experiencing challenges* (13,859 youth) are defined here as those youth who received either a maltreatment-related investigation or intervention service, received services from FSCD, had offence charges, or were involved in corrections. Only those youth who were registered in both the K-12 education system and the Alberta Health Care Insurance Plan (AHCIP) were included. The focus of these analyses is the educational achievement of these challenged youth.

- Among youth who faced challenges, those below educational expectations were younger on average, more likely to be male, and more likely to live in the lowest socio-economic status areas than those above educational expectations. Region of residence did not vary with educational achievement for youth with challenges.

Least and most advantaged Albertan youth

Youth experiencing challenges by health service use and educational achievement

Number and percent of youth experiencing challenges by health service use and educational achievement, Albertan youth aged 12 to 17 years registered in Alberta's K-12 education system and the Alberta Health Care Insurance Plan, 2008/09

Health service use	Educational achievement					
	Below expectations		Meeting/above expectations		Total	
	Youth with challenges	Youth with no challenges	Youth with challenges	Youth with no challenges	Youth with challenges	Youth with no challenges
Physician visits

Total	8,013, 100%	36,878, 100%	5,846, 100%	176,768, 100%	13,859, 100%	213,645, 100%

- Five or more physician visits were more common among youth who were experiencing challenges and who were also performing below educational expectations than among youth facing challenges who were meeting or above expectations.
- Among youth facing challenges, those performing below educational expectations had higher rates of emergency room visits than those who were meeting or performing above expectations.
- Rates of hospitalizations among youth who faced challenges were higher among those performing below expectations compared to youth meeting or exceeding expectations.
- Among youth with challenges, mental health conditions were considerably more common among youth performing below expectations (45%) than those meeting or exceeding educational expectations (29%).

Least and most advantaged Albertan youth

Definitions and Notes

- The study population for this project consisted of all Albertan youth who were registered with the Alberta Health Care Insurance Plan in 2008/09 or who received selected services from one or more of the participating ministries in 2008/09. “All Albertan youth” refers to this study population.
- The study year was fiscal year 2008/09. With the exception of Education and Enterprise and Advanced Education data, all data were for services provided between April 1, 2008 and March 31, 2009, with age determined on March 31, 2009.
 - Data for Enterprise and Advanced Education were for services provided between September 1, 2008 and June 30, 2009, with age determined on March 31, 2009.
 - Data for Education were for services provided to youth who were 12 to 19 years old on September 30, 2008. As a result, youth turning 12 between October 1, 2008 and March 31, 2009 *were not* included in the Education data but were included in other ministries’ data. This resulted in the number of 12 year olds in the Education data being lower (approximately 50% lower) than that of 13 to 17 year olds.
 - Furthermore, although Education only provides services to youth who are under 20, the provision of services is defined by age at September 30. Youth who turned 20 between October 1, 2008 and March 31, 2009 *were* included in the Education data, resulting in the inclusion of 20 year olds in some analyses of Education data.
- **Cross-ministry analyses included only youth that were linked across the relevant ministries.** This means that not all youth in the project were represented in every analysis. As well, only youth with a value for a given indicator were included in analyses involving that indicator (i.e., **missing values** were excluded).
- Age, gender, and postal code (translated into Statistics Canada dissemination areas) were provided for each individual by each participating ministry. In the case of discrepancies between ministries, the most common value for an indicator was chosen. In the event of two or more most common values, the value for the indicator was chosen randomly from the most common values.
- **Mental health status** was defined by the presence or absence of mental health diagnosis codes in Health’s databases (Inpatient—Discharge Abstract Database, Ambulatory Care, and Practitioner Payments), or in the Family Support for Children with Disabilities Information System. Only youth who were registered with Health for the full fiscal year were included in the mental health analyses. **Mental health service use is a proxy for presence of a mental health condition:** Some youth with mental health conditions may not have accessed mental health services in Alberta during the year, and some mental health service use may have occurred for youth who did not in fact have mental health conditions.
 - **Mental health conditions** were grouped based on The Johns Hopkins ACG® Case-Mix System (version 8.2)¹¹. Mental health conditions were *mood/anxiety* (anxiety, depression, bipolar disorder, etc.), *behavioural* (attention-deficit disorder, regulatory disorder, mental or behavioural problems due to substance use, etc.), *neurodevelopmental* (autism, fetal alcohol spectrum disorder, cerebral palsy, etc.), or *schizophrenia/psychoses* (schizophrenia, psychosis, delusional disorder, etc.). Conditions were not mutually exclusive; a youth could have a diagnosis in more than one category.
- **Socio-economic status (SES)** captures the social and material environments in which youth live. A youth was assigned a socio-economic status via an index based on the Statistics Canada dissemination area in which he or she resided¹². Six indicators were included in the index: percent without a high school diploma, the employment ratio, average income, percent of single families, percent of persons living alone, and percent of persons separated, divorced, or widowed. Socio-economic status values fell into five quintiles. In this report, “lowest socio-economic status” refers to the lowest quintile of socio-economic status, while “highest” refers to the highest quintile.
- **Educational achievement** was computed by Alberta Education using age, grade, school type, special education codes, provincial achievement test scores, home education status, number of high school credits earned, number of higher level courses taken, average grade in higher level courses, possession of an Alberta Education certificate or diploma, and Alexander Rutherford scholarship eligibility.

Least and most advantaged Albertan youth

Definitions and Notes

Educational achievement was categorized as *above, meeting, or below expectations* for a student's age and grade. An educational achievement rating was not available for 12 to 14 year old youth without scores on provincial achievement tests, for youth in 'other' schools (accredited post-secondary institutions offering high school courses for credit to adults; most youth in these schools were between 18 and 20 years), and for home-schooled high school youth with no credits.

- Dissemination areas of residence were used by CYDL to determine **region of residence**. Urban areas included large centres with urban core populations greater than 100,000 (i.e., Edmonton and Calgary metropolitan areas) and mid-sized centres with urban cores greater than 10,000; all other areas were categorized as rural.
- New and returning Alberta residents, if they are eligible, must register for **Alberta Health Care Insurance Plan** coverage to receive insured health services. Youth in the "**health registry**" refers to all youth who are insured in Alberta. This includes any eligible youth who is a permanent resident of Alberta, living at least 183 days per year in the province. Members of the Canadian Armed Forces, Royal Canadian Mounted Police and federal penitentiary inmates are not eligible (they receive coverage from the federal government), but dependents of these non-eligible residents, who reside in Alberta, are eligible.
- **Physician visits** reflect fee claims made by physicians for services provided when patients visit their offices. In this report, multiple claims by a given physician for a given patient on the same day were counted as a single visit. Reasons for physician visits were not available for this project.
- **Emergency room visits** refer to visits to emergency departments for assessment or treatment. **Reason for emergency room visit** was based on the primary diagnostic code given for each visit. Categories of reasons included *injury/poisoning* (ICD-10-CA¹³ Chapter XIX Injury, poisoning and certain other consequences of external causes), *respiratory* (Chapter X Diseases of the respiratory system), *influencing factors* (Chapter XXI Factors influencing health status and contact with health services), *symptoms/signs* (Chapter XVIII Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified), and *other* (all other ICD-10-CA chapters).
- **Hospitalizations** refer to admissions to hospital for assessment or treatment. **Hospital service type** was defined by the main patient service code (the patient service that contributes to the longest portion of a patient's stay; see the Canadian Institute for Health Information's DAD Abstracting Manual¹⁴ for codes). Categories of services were labelled *general medicine* (patient service codes 01 to 29, 55, 56, 58, 60 to 63, 66 to 76, 82, 91, 96, 99), *surgery/procedure* (patient service codes 30 to 49, 81, 87), *psychiatry* (patient service codes 64, 65), or *pregnancy-related* (patient service codes 51 to 54, 59).
- **Maltreatment-related investigations** occur when there is a concern that the safety or well-being of a youth is threatened. Outcomes of investigation include *in care after investigation* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), *out of care services* (the youth remains in the home and the family receives support services), and *no intervention needed*.
- **Maltreatment-related interventions** occur when the safety or well-being of a youth is threatened. Categories of intervention include *in care services* (the youth is taken into care, and placed in a foster home, with family, in a group home, etc.), and *out of care services* (the youth remains in the home and the family receives support services).
- **Family Support for Children with Disabilities (FSCD)** is a ministry of Human Services program that provides a range of supports and services to families that strengthen their ability to support and care for their child with a disability based on their needs.
- Youth with **offence charges** include those charged with criminal offences or administrative offences related to criminal offences (e.g., failure to appear in court, breach of probation, etc.). **Number of offences** in the study year was available, but individual incidents were not available. This means that youth charged with multiple offences may have had multiple charges in a single incident, or they may have been charged in multiple incidents.
- Youth with **corrections involvement** have appeared before the Court or a Justice of the Peace for an offence charge and have been remanded in custody or placed under pre-trial supervision in the community awaiting further court dates, or have been found guilty and sentenced to a community disposition (i.e. Fine, Probation, Community Service Work, Deferred Custody) and/or custody (in which the sentence is served in a young offender facility).

The Child and Youth Data Laboratory

The **Child and Youth Data Laboratory** (CYDL) links and analyzes administrative data from child- and youth-serving ministries in the Government of Alberta. The ministries participate in research design and provide data elements that contribute to answering research questions.

The CYDL's research provides groundbreaking opportunities to understand relationships between critical factors in the lives of children and youth in Alberta. The research results can be used to inform policy and program development and evaluation, both within and across ministries, and to inspire further research.

The CYDL is managed by the **Alberta Centre for Child, Family and Community Research** (ACCFRC). The Centre has evolved over its eight year history as a public-sector, innovative resource for evidence. The Centre develops, supports and integrates research across sectors and disciplines to provide a strong, evidence-based foundation for identifying and promoting effective public policy and service delivery to improve the well-being of children, families, and communities in Alberta, Canada, and internationally.

Our partners

This project was carried out on behalf of six ministries of the Government of Alberta. Each ministry collaborated extensively with the CYDL on this project, and their dedication to the project is gratefully acknowledged:

Enterprise and Advanced Education
Education
Health
Human Services
Aboriginal Relations
Justice and Solicitor General
